„Paß auf," sagte der Häuptling, „er bekommt bestimmt das Mädchen mit sich." Chorincui ging direkt zu dem Mädchen und fragte es, ob es mit ihm gehen und ihm helfen

wolle, Maisbier zu trinken. Das Mädchen war bereit und folgte ihm bis dahin und setzte sich zu den anderen Frauen.

Aguaratunpa ging erbost umher.

Der Häuptling fragte, ob jemand singen könne. Aguaratunpa kleidete sich in seinen „tirucumbai" (Abb. 81) und machte sich zum Singen bereit, er konnte aber nicht mehr als „púhuaté, púhuaté". Urapau kam nun hervor und wollte singen, er konnte aber nur „hú, hú" sagen.

Da bat der Häuptling „Húiratucúhua" zu singen und dieser sang:

„Huaté púhuatékus rárásé mánura lúhuaya chúshico ti, ti, ti, ti . . ."

Dort war ein Mann, der mit seinem Bruder und allen den anderen Vögeln verfeindet war, der nicht am Trinkgelage teilnahm, sondern umherging und jagte.

Auf einem Baum saßen viele Papageien. Unter diesen war ein weißer Papagei. „Den will ich fangen", sagte er und versuchte es, ihn mit einer Schlinge an einer Rute zu fangen, aber es gelang ihm nicht. Er zielte nun mit dem Bogen nach dem Papagei. Dieser fing zu sprechen an und sagte: „Warum willst du mich töten?"

Der Papagei lehrte ihn nun, wie er singen solle, und sagte ihm, wenn er mitten unter die käme, die trinken, solle er den Arm über den Kopf hochstrecken.

Er ging nun um diejenigen, die tranken, herum und sang. Dann ging er mitten unter sie und streckte den Arm hoch. Als er dies tat, wurden diejenigen, die standen, in Vögel, und die, die saßen, in Steine verwandelt, außer Inómu, Tatutunpa, Aguaratunpa und Teyuhuasu.

Tatutunpa, Aguaratunpa und Teyuhuasa saßen nicht mit den anderen zusammen, sondern standen in der Nähe. Tatutunpa sagte zu Aguaratunpa:

„Du sollst sehen, ich mache das Mädchen schwanger.[1])

[1]) Gemildert.

6:Nordenskiöld SF10 Chiriguano

Wenn sie den Körper dreht, ist es geschehen." Er grub nun ein Loch in der Erde unter dem Mädchen . . .

Die Fortsetzung von Batirayus Erzählung ist mit der Yambásis beinahe identisch.

In ihren Grundzügen scheint mir diese Sage echt indianisch zu sein. Es sind jedoch Elemente darin, die von den Weißen geliehen zu sein scheinen, nämlich die Geschichte von den Lügen des Mondes. Diese kommt in Batirayus Version der Sage nicht vor. Sie erinnert mich auch sehr an den Knaben, der um Hilfe zu rufen pflegte, ohne daß eine Gefahr vorhanden war. Als schließlich die Wölfe dabei waren, ihn aufzufressen, kümmerte sich keiner um ihn. — eine Sage, die in Europa bekannt ist und die ich in Schweden als Kind gehört habe.

Ein Teil dieser Sage erinnert stark an eine von d'Orbigny[1]) von den Yuracáreindianern wiedergegebene Sage. Dem Tatutunpa entspricht dort „Tiri", der, um seine Mutter zu rächen, alle Katzentiere, außer dem Jaguar mit den vier Augen, der seine Zuflucht zum Monde nimmt, tötet. Früher standen die Chirigoanus und Chanés sicher in Verbindung mit den Yuracáreindianern. Als die Weißen das Land um Santa Cruz de la Sierra eroberten, zogen die Chiriguanos nach Süden und die Yuracáres nach Norden. Auf meiner letzten Reise habe ich auch die Yuracáreindianer besucht, die ich später in einem anderen Buche schildern werde.

Der Mann, der sich mit der Tochter des Donnergottes, Chiqueritunpa, verheiratete.

Erzählt vom Chanéhäuptling Bóyra.

Es waren einmal in alten Zeiten drei arme Männer, die keine Verwandten hatten. Sie waren sehr hungrig. Zwei von ihnen gingen, um etwas zum Essen zu suchen. Erst kamen sie in einen großen Wald, durch den ein Pfad ging.

[1]) d'Orbigny. Voyage dans l'Amérique Méridionale. T. 3, 1. Paris 1834, S. 212.

6:Nordenskiold SF10 Chiriguano

Nach drei Tagen kamen sie auf eine große Ebene. Mitten in der Ebene war ein Haus. Sie gingen um das Haus herum, fanden aber keinen Eingang. Schließlich kam aber eine Frau heraus, es war Chiquéritunpas Schwester. Sie bat sie, hineinzukommen. „Wir sind schmutzig", sagten sie und wollten nicht hineingehen. Sie brachte dem einen Maisbier. Er trank vier Kalebaßschalen Maisbier aus. Sie brachte dem anderen Maisbier. Auch er trank vier Kalebaßschalen Maisbier aus. „Geht nun und badet euch," sagte sie, „und wascht euch den Kopf." Sie gab ihnen die Wurzel der „yúag".[1])

Als sie gebadet und sich gewaschen hatten, kamen sie wieder. Sie gab ihnen Uruku, um sich zu bemalen. „Geht nun und ruht aus. Nachher sollt ihr Holz holen," sagte sie und gab ihnen eine Axt. Sie suchten überall in der Ebene, fanden aber kein Holz. „Habt ihr kein Holz gefunden?" fragte die Frau.

„Nein", sagten sie.

„Saht ihr dort keinen alten Mann? Er hat Holz. Gebt ihm einen Hieb mit der Axt", sagte die Frau.

Sie gingen wieder auf die Ebene, um Holz zu suchen. Dort fanden sie den Alten, sie schämten sich aber, ihm einen Hieb mit der Axt zu geben, und kehrten zur Frau zurück.

„Habt ihr den Alten getroffen?" sagte sie.

„Ja," antworteten sie, „aber wir schämten uns, ihn zu töten."

„Haut den Alten, er ist Holz!" sagte die Frau.

Sie gingen wieder auf die Ebene und fanden ihn. Sie gaben ihm einen Axthieb, und er verwandelte sich in Holz, das sie zur Stube trugen. Die Frau kochte. Dann spann sie Fäden.

„Warum seid ihr hierhergekommen?" sagte sie.

„Wir suchten uns eine Mutter. Wir waren drei, aber einen haben wir zurückgelassen", sagten sie.

„Warum habt ihr ihn nicht mitgenommen?" sagte die Frau.

---

[1]) = Mistol.

6:Nordenskiöld SF10 Chiriguano

Sie ließ die Männer baden. Sie badeten und die Frau badete auch. Sie sahen, daß sie ein hübsches Weib war.

„Hier sollt ihr eine Hütte und eine Falle machen und Tauben fangen! Wenn die Tauben kommen, werden sie sich in Frauen verwandeln. Wenn diese baden, sollt ihr ihre Kleider nehmen und laufen!" sagte die Frau. Eine Masse Tauben kamen und setzten sich auf die Bäume um den Sumpf. Unter ihnen war ihr großer Häuptling. Die Tauben flogen ans Ufer und verwandelten sich in Frauen und nahmen ihre Kleider (tiru) ab. Die Männer schlichen sich heran, jeder von ihnen nahm drei Kleider und lief davon. Die Frauen liefen ihnen nach. Der eine warf zwei Kleider fort und kam mit einem Kleid und einer der Frauen ins Haus. Der andere lief mit allen drei Kleidern. Die Frauen holten ihn ein und prügelten ihn ordentlich. Derjenige, der mit einem Kleid gekommen war, kam mit seiner Frau ins Haus.

Abb. 128. Kalebaßschale. Chiriguano. Itatenbia. 1/4.

„Legt euch schlafen!" sagte die Schwester Chiquéritunpas.

Der Mann legte sich mit seiner Frau, die die Tochter Chiquéritunpas war, schlafen. Sie schliefen den ganzen Tag zusammen und am Abend gebar sie. Am folgenden Tag kam Chiquéritunpa. Er wollte seine Tochter schlagen. Er schickte nach einem Pferd, einem Esel und einer Stute, um seine Tochter und seinen Schwiegersohn nach Hause zu bringen. Nachdem sie gegessen hatten, ritten sie fort.

Der Mann, der von den Frauen geprügelt worden war, weinte. „Weine nicht so sehr", sagte die Schwester Chiquéritunpas. Als sie ein Stückchen geritten waren, trafen sie einen Christen, der arbeitete.

„Was für Arbeit hast du vor?" fragte der Mann. „Ich

6:Nordenskiöld SF10 Chiriguano

will Mandioka und Mais säen. Hier will ich wohnen und hierhin will ich ein Weib bringen", sagte der Christ.

Sie ritten weiter und trafen einen anderen Christen. „Was für Arbeit hast du vor?" fragte der Mann. Übel gelaunt antwortete der Christ: „Hier will ich Hügel mit dornigen Büschen säen."

Sie setzten ihre Reise fort und trafen einen anderen Christen, der mit dem Fällen von Bäumen beschäftigt war. „Was für Arbeit hast du vor?" fragte der Mann. „Ich haue Stangen zur Einzäunung für die Tiere, denn hier will ich Vieh haben. Alles nehme ich hierher, Kleider werde ich mir schaffen", sagte der Christ.

Sie ritten weiter und trafen einen anderen Christen. „Was für Arbeit hast du vor?" fragte der Mann. Übel gelaunt antwortete der Christ: „Ich arbeite, um Steine zu ernten."

Sie ritten weiter und trafen einen anderen Christen, der tischlerte. „Was machst du hier?" fragten sie. „Ich will mir ein Haus bauen, wo ich Kleider und alles mögliche andere haben will", antwortete der Christ.

Sie ritten weiter und trafen einen anderen Christen. „Woran arbeitest du?" fragte der Mann. Übel gelaunt erwiderte der Christ: „Hier will ich Chuchio[1]) säen, damit niemand passieren kann.

Als sie nahe dem Hause des Chiquéritunpa waren, sagte dessen Tochter zu ihrem Mann: „Erst werde ich mit dem Knaben absteigen, der schon gehen kann. Hierauf sollst du absteigen, und wenn du dich auf die Bank setzt, sollst du dich nicht wundern, wenn sie sich bewegt. Bewegt sich das Haus, sollst du dich nicht wundern. Du sollst nicht meine Mutter grüßen und auch nicht meinen Bruder. Nur den Vater sollst du grüßen."

Als sie ankamen, stieg sie zuerst ab und trat ein. Ihr folgte der Knabe, der schon gehen konnte. Zuletzt stieg der

---

[1]) Siehe S. 166.

Mann vom Pferde. Als er vom Pferde stieg, verwandelte es sich in einen Haufen Knochen. Er ging hinein und setzte sich auf einen Schemel. Derselbe bewegte sich, denn er war eine große Schlange. Er tat, als merke er nichts. Auch das Haus bewegte sich, er tat aber, als kümmere er sich nicht darum. Zuerst kam seine Schwiegermutter und grüßte ihn, er beantwortete aber den Gruß nicht. Darauf kam sein Schwager und grüßte, aber er beantwortete auch dessen Gruß nicht. Der Schwager schlug ihm vor, sie sollten spielen, er antwortete ihm aber nicht.

„Heute Nacht sollst du nicht bei mir schlafen. Ich schlafe in einer Hängematte, mein Sohn in einer und du in einer dritten," sagte Chiquéritunpas Schwester zu ihrem Mann. „Morgen sollst du mit meinem Bruder spielen", sagte sie. Sie legten sich nun schlafen.

Fig. 129. Tongefäß. Chiriguano. Caipipendi. 1/3.

Am folgenden Tage rief der Hahn früh: „Jesus Christus, Jesus Christus!" Als der erste Christ, der ihnen begegnet war, nach seinem Acker kam, fand er ihn voll von Mais und Mandioka und außerdem eine Hütte und ein hübsches Weib. Der zweite Christ, der geantwortet hatte, er wolle Hügel mit dornigen Büschen säen, fand seinen Acker in solche verwandelt. Der dritte Christ fand seine Umzäunung für die Tiere schon fertig und voll von schönem Vieh. Derjenige, der geantwortet hatte, er wolle Steine säen, fand seinen Acker voller Steine. Derjenige, der getischlert hatte, um sich ein Haus zu bauen, fand es schon fertig und voller Kleider. Derjenige, der übellaunig geantwortet hatte, er wolle Chuchio säen, fand den Acker in dichtes Gestrüpp verwandelt, durch das niemand konnte.

Chiquéritunpas Sohn schlug seinem Schwager ein Spiel vor. „Was für ein Spiel?" sagte er. „Wir wollen das Haus

6:Nordenskiöld SF10 Chiriguano

wegrücken", sagte Chiquéritunpas Sohn und versetzte es mit einem Arm. Mit seiner ganzen Stärke rückte der Mann das Haus weg. „Nun wollen wir das Pferd wieder lebendig machen", sagte Chiquéritunpas Sohn und hob die Beine des Pferdes, auf welchem der Mann gekommen war, hoch. Es verwandelte sich in ein sehr fettes Pferd mit feuersprühendem Mund. Auch dies machte der Mann nach.

Am folgenden Tag schlug der Mann seinem Schwager, Chiquéritunpas Sohn, ein Spiel vor. „Was wollen wir spielen?" sagte er. „Wir wollen die Sonne herunternehmen", sagte der Mann. Mit einer langen Rute aus Chuchio nahm er die Sonne herunter. Es wurde nun so warm, daß sowohl Chiquéritunpa wie sein Sohn davonliefen. Am folgenden Tag wurde der Mann Häuptling.

Derjenige, der von den Mädchen Prügel bekommen hatte, denen er ihre Kleider geraubt hatte, blieb bei der Schwester Chiquéritunpas. Eines Tages sagte sie zu ihm, er solle nach einem großen See gehen. Dort solle er tauchen und eine Handvoll Sand heraufholen. Diesen Sand solle er in das Haus legen. Er ging nun zum See, tauchte und holte eine Handvoll Sand herauf, den er ins Haus legte. Am folgenden Tage sagte die Schwester von Chiquéritunpa: „Sieh nun nach, was aus dem Sande geworden ist!" An Stelle des Sandes fand er ein hübsches Weib. „Dies soll deine Frau sein", sagte Chiquéritunpas Schwester.

Am Tage pflegte er mit ihr am See zu baden. Dort spielte er mit ihr, liebkoste sie und im Bade bespritzten sie sich mit Wasser.

„Bade nicht mit ihr so viel am See. Denke daran, daß sie nur aus Sand gemacht ist", sagte Chiquéritunpas Schwester.

Er hörte nicht auf sie, sondern spielte und koste mit ihr unten am Seeufer. Eines Tages, als er mit ihr spielte, wurde sie immer schmaler, bis sie sich zuletzt in einen Haufen Sand verwandelte. Weinend ging der Mann zur Schwester Chiquéritunpas. Hayma opama! (Und mehr war es nicht).

Diese Sage ist, wie wir sehen, nicht frei von europäischen

6:Nordenskiöld SF10 Chiriguano

Elementen. In ihren Hauptzügen ist sie jedoch rein indianisch. Keine der von mir hier mitgeteilten Sagen scheint mir so phantasiereich, wie diese.

„Choihuihuis" Frauenraub.

Erzählt von dem Chanéhäuptling Bóyra.

Es war einmal in alten Zeiten ein großes Trinkgelage. Dort waren Aguaratunpa, Tatutunpa, Teyuhuasu, Inómu,[1]) Choihuihui[2]) und viele andere. Aguaratunpa war gegangen, um Inómu zu holen. Sie blieb vier Tage und trank mit ihnen. Zuletzt kam ihre Mutter, die sehr ärgerlich war, daß sie so lange fortgeblieben war. Sie verwandelte alle, die dort waren, in Vögel und nahm Inómu mit nach Hause. Nur Aguaratunpa, Tatutunpa und Choihuihui waren dort geblieben. Tatutunpa ging nach Hause. Aguaratunpa, der keine feste Wohnstätte hatte, streifte umher und betrog die Menschen. Choihuihui machte sich auch auf den Weg. Er kam nach einem Hause. Dort wohnte eine verheiratete Frau mit ihrer Tochter. Er grüßte sie. Sie bot ihm Maisbier und er trank. Darauf nahm er Abschied und ging. Er blieb jedoch, in einen Choihuihui verwandelt, ganz in der Nähe, um zu spionieren. Nach einem Weilchen kam der Mann der Frau nach Hause. Dieser nahm sie mit und sie gingen nach dem Felde, sie um zu ernten, er um zu graben. Als sie dorthin gekommen waren, machten sie Feuer an. Er ging, um zu graben, sie blieb beim Feuer mit der kleinen Tochter und röstete Mais. Choihuihui war ihnen nachgegangen. Er blieb in der Nähe. Nach einem Weilchen ging die Frau abseits, um ihre Notdurft zu verrichten. Als sie in den Wald kam, umschlang Choihuihui sie. In einen Vogel verwandelt, flog er mit ihr davon.

Da die Mutter nicht zurückkam, begann das Mädchen zu weinen. Als der Vater dies hörte, ging er dorthin. Er

[1]) Inómus Geschichte ist im Vorhergehenden erzählt.
[2]) Ein Vogel.

6:Nordenskiöld SF10 Chiriguano

rief seine Frau, aber niemand hörte. Er suchte sie und fand ihre und Choihuihuis Spur. Vergebens versuchte er ihnen zu folgen. Nachdem er lange gesucht hatte, suchte er die Brüder seiner Frau auf, damit sie ihm suchen hälfen. Sie suchten, fanden aber niemand. Die Brüder glaubten, der Mann habe seine Frau aus Eifersucht getötet. Als sie an einem großen Baum vorüber kamen, sahen sie im Gipfel das Nest eines „Tuyuyu".[1]) Die Brüder sagten zu dem Manne, er solle die Vögel fangen, um sein Kind zu trösten. Da der Baum einen hohen, geraden Stamm hatte, machten sie eine Leiter und der Mann kletterte hinauf. Als er bis zum Gipfel des Baumes gekommen war, nahmen die Brüder die Leiter weg, damit der Mann nicht herunter könne. „Dort sollst du sitzen bleiben und verhungern, weil du deine Frau getötet hast", sagten sie. Der Mann begann zu weinen. Zuletzt schlief er, an den Stamm gelehnt, ein.

Als er erwachte, saß er in einer Hütte. Neben ihm saßen zwei hübsche Frauen. Sie fragten ihn, wie er dorthin gekommen sei. Er erzählte nun, daß ein Mann in sein Haus gekommen sei usw. (hier wird die ganze Sage wiederholt).

Die Frauen begannen zu lachen. „Avayurupiagua hat deine Frau fortgeführt", sagten sie.

Er fragte sie, wer ihr Vater sei. „Er ist nach Itica[2]) gegangen, um Fische[3]) zu holen", sagten sie.

Die Jüngste sagte, er solle bei ihr schlafen, was er tat. Auch die Älteste wollte bei ihm schlafen. „Wird deine Mutter nicht ärgerlich, wenn ich es tue?" sagte er. „Nein, du sollst bei uns schlafen, denn hierher kommt niemals ein Mann", sagten sie. Er schlief somit bei beiden Frauen.

Nach einigen Tagen kam der Vater der Mädchen nach Hause. Er brachte zwei große Bürden getrockneter Fische

---

[1]) Wahrscheinlich Flamingo.

[2]) Rio Pilcomayo.

[3]) S. 138 wird der bedeutende Handel mit getrockneten Fischen, der zwischen den Stämmen betrieben wird, geschildert.

6:Nordenskiöld SF10 Chiriguano

mit. Der Vater fragte, wie er hierher gekommen sei. Er erzählte usw. (hier wird die ganze Sage wiederholt).

Der Vater sagte, er sei ihm nicht böse ,weil er bei seinen beiden Töchtern geschlafen habe, und versprach ihm seine Hilfe, um die Frau zurückzubekommen. Sie ist am Itica bei Avayurupiagua," sagte er. „Dort ist ein großes Trinkgelage und wir wollen hin. Du sollst mit mir kommen und tun, was ich sage. Erst sollst du alle grüßen, und zuletzt sollst du deine Frau grüßen. Sie wird dich nicht erkennen. Wenn sie dich grüßt und dir Maisbier anbietet, so schlingst du deine Arme um sie und ich schlage dich auf den Steiß", sagte er. Sie begaben sich nun nach Itica. Als sie dorthin kamen, grüßte der Vater zuerst alle. Zuletzt grüßte der Mann seine Frau. Sie bot ihm eine Kalebasse Maisbier. Er umschlang sie und der Alte klopfte ihn auf den Steiß. In einen Tuyuyu verwandelt, flog er mit seiner Frau davon. Als Avayurupiagua dies sah, stürzte er ärgerlich in sein Haus, um Bogen und Pfeile zu holen. Er schoß einen Pfeil nach dem anderen ab, konnte sie aber nicht treffen.

Diese Sage scheint mir vollständig rein von fremden Elementen zu sein. Mit der hier erwähnten Leiter meint man einen langen Stock, in den man Trittstufen gehauen hat. Solche wenden besonders die Chiriguanos sowie die Chanés am Itiyuro stets für die Maisscheunen an, die auf Pfählen gebaut sind (s. Abb. 84 b).

Wie Aguaratunpa Tatutunpa tötete und dann selbst getötet wurde.

Erzählt von dem Chanéhäuptling Batirayu.

Es waren einmal in alter Zeit zwei verrückte Mädchen. Nicht weit davon wohnte Tatutunpa. Sie hörten ihn so schön auf seinem „huiramimbi" (s. Abb. 84 b) pfeifen. Die eine sagte zu der anderen: „Wir wollen hingehen und sehen, wer so schön spielt." Sie gingen zu Tatutunpa, der in seiner Hängematte lag. Tatutunpa nahm das jüngste der Mädchen zur Frau.

6:Nordenskiöld SF10 Chiriguano

Aguaratunpa hatte erfahren, daß die Mädchen sich zu Tatutunpa begeben hatten. Er ging hin, verbarg sich in dem Acker, wo Tatutunpa arbeitete und tötete ihn mit einem Knüppel. Hierauf zog er vorsichtig die Kopfhaut ab und bekleidete sich damit. Auf diese Weise dem Tatutunpa gleichend, ging er zu dessen Hütte.

„Sieh, dort kommt dein Mann", sagte die ältere Schwester. Sie stellte Essen auf den Tisch. Da Tatutunpa sehr wenig zu essen pflegte, nur ein paar Bohnen und eine kleine Schale Maisbier, trug sie nicht mehr auf. Als Aguaratunpa kam, aß er alles auf und verlangte noch mehr. Als er dies gegessen hatte, verlangte er noch mehr. Das Mädchen fragte sich, ob dies wirklich ihr Mann sein könne, der so viel aß, es konnte ja aber kein anderer sein.

Am Abend bat Aguaratunpa seine Frau, sie möchte ihn lausen. Sie setzte sich und suchte Läuse auf dem Kopfe Aguaratunpas. Während sie suchte, schlief Aguaratunpa ein. Sie sah da, daß die Haut auf seinem Kopf zusammengenäht war, und verstand, daß er ihren Mann getötet und abgehäutet hatte. Sie erzählte dies ihrer Schwester, und sie töteten Aguaratunpa mit einen Knüppel.

Der Mann, der Añatunpa verbrannte.

Erzählt von dem Chiriguanoindianer Yambási am Rio Grande.

Wenn die Menschen Honig sammelten, suchte Añatunpa[1]) sie auf und fraß sie auf.

Es war einmal ein Mann, der Honig sammelte. Da kam Añatunpa und fragte ihn, was er tue. „Ich sammle Honig", sagte der Mann. „Fahre damit fort", sagte Añatunpa. Als der Mann genug gesammelt hatte, tötete er ihn und warf ihn Dyóri hin, der ihn auffraß und sogar das Blut aufleckte. Auf diese Weise tötete Añatunpa viele Menschen.

Ein Mann war ausgegangen, um Honig zu sammeln. Der

[1]) Hier wird nicht gesagt, welcher Añatunpa gemeint ist.

Tukan[1]) sagte zu ihm: „Wenn Añatunpa kommt, so bitte ihn, dich nach seinem Hause zu tragen und dich dort zu töten."

Während der Mann Honig sammelte, kam Añatunpa. „Was willst du?" fragte der Mann.

„Ich will dich auffressen", sagte Añatunpa.

„Tue das nicht hier, sondern trag mich nach deinem Hause und friß mich dort auf", sagte der Mann. Añatunpa nahm nun den Mann auf den Nacken und trug ihn zu sich.

„Brich Zweige ab und mache auf dem Nacken Añatunpas Feuer an", sagte der Tukan. Als Añatunpa durch das dichte

Abb. 130. Silberne Nadel zur Befestigung des Tiru. Die Form indianisch, die Ornamente spanisch. Chiriguano. Parapiti. 1/3.

Gestrüpp ging, brach der Mann Zweige und Äste ab und machte auf dem Nacken Añatunpas vorsichtig Feuer an.

„Wenn du an einen niedrigen Zweig kommst, so klammere dich fest!" sagte der Tukan zum Manne. Das tat dieser. Bald merkte Añatunpa, daß es ihm im Nacken brenne und begann zu laufen. Das Feuer nahm zu. Seine Haare fingen Feuer und bald verbrannte Añatunpa vollständig und starb.

Der Mann, der Añatunpa tötete.

Erzählt von dem Chiriguanoindianer Yambási am Rio Grande.

Añatunpa fraß alle Menschen auf, die er erwischen konnte. Da kam ein Mann, der zu Añatunpas Höhle Holz trug. „Komm, wir wollen spielen!" sagte Añatunpa.

---

[1]) Rhamphastus.

6:Nordenskiöld SF10 Chiriguano

„Was für ein Spiel?" sagte der Mann.

„Du sollst mir mit einer Axt einen Hieb vor die Stirn versetzen, und wenn ich nicht sterbe, schlage ich dich", sagte Añatunpa.

Añatunpa stellte sich gerade auf, reichte dem Mann die Stirn und dieser schlug ihn mitten auf dieselbe. Da Añatunpas Stirn hart wie Eisen war, tat ihm dies nichts. Añatunpa gab nun dem Mann einen Schlag vor die Stirn, tötete ihn und warf ihn Dyóri zu, der ihn auffraß.

Ein anderes Mal kam ein anderer Mann zu Añatunpas Höhle. Añatunpa schlug ihm dasselbe Spiel vor. Eine Fliege „Mbéru" rief ihm da zu, er solle ihn nicht auf die Stirn, sondern in den Nacken hauen. Als Añatunpa sich mit geschlossenen Augen aufstellte, um den Hieb zu erhalten, ging der Mann hinter ihn, hieb ihn in den Nacken und Añatunpa fiel tot nieder. Dyóri fragte ihn, wie er habe Añatunpa töten können. Der Mann erzählte ihm, was Mbéru gesagt hatte.

„Sehr gut", sagte Dyóri.

Wie Bisose Reichtümer aus dem Berge holte.

Erzählt von dem Chanéindianer Eatirayu.

Ein Chané, Bisose, wollte in einem tiefen Pfuhl angeln. Erst angelte er viele kleine Fische. Plötzlich angelte er einen so großen Fisch, daß er ihn nicht heraufzuziehen vermochte. Er ging erst um den Pfuhl herum, weil er Angst hatte, hineinzugehen. Schließlich stieg er vorsichtig ins Wasser, indem er der Angelschnur mit der Hand folgte. Als er in tiefes Wasser gekommen war, fühlte er, daß ihn jemand ums Bein faßte und in die Tiefe zog. Es war die große Schlange „Boyhuasu". Diese führte Bisose im Gebirge umher und nach los Campos del guanaco. Schließlich führte sie ihn durch einen engen Paß in den Berg hinein. Dort gab sie ihm blaue Steine und Silber. Bisose belud sich damit. Als er aus dem Paß herauswollte, war er so eng, daß

6:Nordenskiöld SF10 Chiriguano

er nur wenig mitnehmen konnte. Deshalb sind diese Steine und Silbersachen so selten. Boyhuasu führte ihn dann zum Pfuhl zurück. Er kam an derselben Stelle heraus, wo er ins Wasser gestiegen war.

In dieser Sage werden unter den Kostbarkeiten, die Bisose aus der Tiefe holte, blaue Steine erwähnt. Durchbohrte Türkise und Chrysocol schätzen diese Indianer auch als Halskettenperlen hoch.

Der Fuchs und der Jaguar.

Erzählt von dem Chanéhäuptling Bóyra.

Der Fuchs traf den Jaguar in seinem Acker. Dieser war mit Säen beschäftigt.

„Willst du, daß ich dir helfen soll, Onkel?" sagte der Fuchs.

„Ja, Neffe. Ich will mir die Grabestöcke holen", sagte der Jaguar.

„Das will ich", sagte der Fuchs und ging zur Hütte des Jaguars.

Als er dorthin gekommen war, sagte er zur Frau des Jaguars: „Ich schäme mich, dir mein Anliegen zu sagen."

„Wieso?" sagte sie.

„Ja," sagte der Fuchs, „der Jaguar hat mich hierher geschickt, damit ich bei dir und deinen beiden Töchtern schlafe." Das glaubte die Frau des Jaguars nicht.

„Ja, es ist wahr," sagte der Fuchs. „Du sollst hören, was er sagt," und nun rief er: „Soll ich sie alle nehmen?"

„Alle", rief der Jaguar als Antwort.

Der Fuchs schlief nun zuerst bei der Frau des Jaguars und dann bei der ältesten Tochter und dann bei der jüngeren. Sie war noch Jungfer, und er tat ihr weh.[1]) Darauf ging der Fuchs weg. Er lief im Grase, damit die Spuren nicht sichtbar wären. Er sprang auf einen langen Holzstamm. Zu-

[1]) Gemildert.

letzt kam er an einen Pfuhl. Er tauchte unter und kam an der anderen Seite wieder herauf. Er lief, was er laufen konnte, bis er zu einem Baum mit dornigem Stamm kam. Er kroch an demselben hinauf und legte sich schlafen. „Hier will ich liegen und von der Frau und den Töchtern des Jaguars träumen, bei denen ich geschlafen habe", sagte der Fuchs. Er legte sich hin und schlief ein.

Abb. 131. Brustschmuck aus Silber. Chiriguano. Caipipendi. Wird von Männern getragen.

Als der Jaguar merkte, daß der Fuchs nicht mit den Grabehölzern kam, dachte er: „Ich will doch nachsehen, was aus dem Fuchs geworden ist. Der Fuchs ist doch ein Schwindler."

Als der Jaguar nach seinem Hause kam, sagte seine Frau zu ihm: „Wie kannst du so grausam sein und den Fuchs herschicken, daß er bei uns schlafe?"

Ergrimmt machte sich der Jaguar auf den Weg, um den Fuchs zu suchen. Er folgte seinen Spuren und kam zu dem Pfuhl, wo die Spuren des Fuchses ein Ende nahmen. Überall suchte er ihn. Schließlich verstand er, daß der Fuchs in den Pfuhl getaucht war. Der Jaguar tauchte nun auch nieder und fand die Spuren des Fuchses auf der anderen Seite. Er folgte ihnen und kam zu dem Baume. Überall um den Baum suchte er die Fortsetzung der Spuren, fand sie aber nicht. Da sah er auf und sah den Fuchs, der schlief. Er kletterte hinauf, brach vorsichtig einen Zweig ab und kitzelte den Fuchs in den Nasenlöchern. Dieser nieste, wischte sich die Nase und sagte: „Können die Moskitos mich nicht in Ruhe lassen, wo ich gerade von der Frau und den Töchtern des Jaguars träume, bei denen ich geschlafen habe!"

Nun kitzelte ihn der Jaguar etwas kräftiger, und der Fuchs erwachte. Der Jaguar machte sich bereit, ihn zu packen.

Der Fuchs kroch zusammen, und da der Jaguar zögerte, ihn zu fassen, sprang er mit einem Satz zur Erde und begann zu laufen, alles was er laufen konnte. Der Jaguar verfolgte ihn. Schließlich ermattete der Fuchs jedoch, und der Jaguar fing ihn und verschluckte ihn. Der Fuchs wurde im Magen des Jaguars wieder lebendig. Dieser brach ihn aus. Der Jaguar fraß den Fuchs wieder auf, dieser wurde aber wieder in seinem Magen lebendig und wieder ausgeworfen. Wiederum fraß der Jaguar den Fuchs auf, der wieder lebendig wurde usw.

Diese Sage hat eine weite Verbreitung. In etwas verschiedener Form habe ich sie in Carmen in Mojos erzählen hören.

Als die Schildkröte „Carumbe" den Jaguar tötete.

Erzählt von dem Chiriguanoindianer Yambási.

Es war einmal ein großes Trinkgelage. Dort waren Aguaratunpa, Carumbe und „Taturapua" (das Kugelgürteltier). Der kleine Sohn der Schildkröte weinte. Da man ihn fragte, warum er weine, sagte er, er wolle die Krallen des Jaguars haben, um damit zu spielen. Die Frau der Schildkröte sagte zu ihrem Manne, er solle die Krallen des Jaguars holen, damit der Kleine damit spielen könne.

Die Schildkröte machte sich auf den Weg und kam zu einem Stamm „samuo" mit großen, scharfen Dornen. Dort blieb sie stehen und wartete auf den Jaguar. In der Entfernung hörte sie sein Brüllen. Der Jaguar kam, immer brüllend, näher und fand die Schildkröte am Fuße des Baumes.

„Was tust du hier?" sagte der Jaguar.

„Ich spiele", sagte die Schildkröte.

„Wie geht das zu?" sagte der Jaguar.

„Ich klettere auf den Samuo hinauf und dann rolle ich herunter", sagte die Schildkröte.

„Laß mich sehen", sagte der Jaguar, der Lust hatte, die Schildkröte aufzufressen.

6:Nordenskiold SF10 Chiriguano

Diese kletterte am Stamme bis zum Gipfel hinauf und rollte herab, ohne sich zu beschädigen. Dies machte dem Jaguar Spaß, und die Schildkröte mußte wieder hinaufklettern. Wieder rollte sie herunter, ohne sich zu beschädigen. Der Jaguar wollte es auch versuchen. Er kletterte hinauf und rollte herunter, riß sich aber an den Dornen alle seine Eingeweide auf und starb.

Die Schildkröte nahm die Krallen des Jaguars als Spielzeug für ihren kleinen Sohn mit nach Hause.

Die Liebessage des Kolibris.

Erzählt von dem Chiriguanoindianer Yambási.

Es waren zwei Mädchen, die Chinu (Kolibri) die Flöte spielen hörten. Er spielte so schön, daß eins der Mädchen sagte: „Ihn will ich zum Manne haben." Sie suchte den Kolibri auf und schlief bei ihm.

„Wir wollen in mein Haus gehen", sagte der Kolibri. Als sie dorthin kamen, war es so klein, daß das Mädchen keinen Platz fand. Sie ging deshalb in ihr Dorf zurück.

Am Abend kam der Kolibri vor das Dorf und spielte Flöte, um sie zu locken. Das Mädchen lauschte und sagte: „Der Kolibri ist's, der spielt." Sie ging aber nicht mehr zu ihm. Jeden Abend kam der Kolibri vor das Dorf und spielte seine schönsten Weisen, das Mädchen wollte aber nicht mit ihm gehen, der eine so kleine Hütte hatte.

Als die Zecke, Yatéu, mit dem Strauß, Yándu, um die Wette lief.

Die Zecke und der Strauß wollten einen Wettlauf veranstalten, um zu sehen, wer am besten laufen konnte. Als sie zu laufen begannen, hüpfte die Zecke auf den Strauß und biß sich in den Augenwinkeln fest.

Als der Strauß eine Strecke gelaufen war, schielte er nach der Seite, um zu sehen, ob die Zecke auch mit war. Da sie in dem Augenwinkel war, sah er sie an seiner Seite.

6:Nordenskiöld SF10 Chiriguano

Der Strauß beeilte sich. Als er ein Stückchen gelaufen war, schielte er wieder zur Seite und sah, daß die Zecke noch an seiner Seite war.

Der Strauß lief aus Leibeskräften. Als er dem Ziele ganz nahe war, hüpfte die Zecke von dem Augenwinkel und kam als erster an.

Die Zecke hatte den Wettlauf gewonnen.

Diese kleinen Tiersagen haben eine ungeheuere Verbreitung. So finden wir die Sage von der Schildkröte und dem Jaguar beinahe unverändert in Santarem an dem Zusammenfluß des Rio Tapajo in den Amazonenstrom.[1])

Auch ähnliche Wettlaufsagen sind von der Küste Brasiliens bekannt.[1]) Diese letzteren finden sich, wie bekannt, auch bei uns.

Man hat, wie schon erwähnt, nachgewiesen,[2]) daß gewisse Sagen von Nordamerika und Asien bis nach Südamerika heruntergewandert sind. Da hier indessen nicht der rechte Platz zu vergleichenden Studien über die von mir gesammelten Sagen ist, habe ich mich damit begnügt, nur das Material vorzulegen.

Wie wir gesehen haben, lernen wir aus den Sagen einen Teil der religiösen Vorstellungen der Indianer verstehen. Sie sind auch aus dem Gesichtspunkt interessant, daß in ihnen eine ganze Menge kleiner Züge aus dem Leben der Indianer wiedergegeben werden. Sie geben uns einen Einblick in ihre Phantasiewelt.

Nur der Inhalt der von mir gesammelten Sagen, nicht die Form, ist als Forschungsmaterial verwendbar. Ich hoffe, daß besonders die eingeborenen südamerikanischen Ethnographen die von mir gemachten Sammlungen fortsetzen und die Sagen auch in den Originalsprachen aufzeichnen werden. Um dies zu können, ist jedoch eine vollständige

---

[1]) Vgl. Fredr. Hartt: Tortoise Myths. Rio de Janeiro 1879.
[2]) Ehrenreich: l. c.

Beherrschung derselben notwendig. Die beste Methode wäre, die Indianer diese Sagen in einen Phonographen sprechen zu lassen.

Die Indianer und die Naturerscheinungen.

In einer der Chanésagen wird erzählt, wie Yahuéte, der zweiköpfige Jaguar, im Begriffe war, den Mond aufzufressen. Maringay nannte Yahuéte „Yahuartéui". Sonnen- und Mondfinsternisse erklären diese Indianer so, daß Sonne und Mond von Yahuéte angegriffen werden. Die Chorotés sprechen, wie schon erwähnt, auch von einem Raubtier, das die Sonne und den Mond anfällt.

Wandert man in einer sternklaren Nacht mit einem Indianer durch Wald und Flur, so ist der Sternhimmel sein Kompaß und seine Uhr. Er deutet auf den Orion oder auf ein anderes Sternbild hin und zeigt, wieviel es sich weiter bewegt hat, bis man ankommt.

Er gibt nicht vielen Sternbildern Namen, er kennt sie aber alle. Den dem südlichsten Kreuz am nächsten liegenden Teil der Milchstraße nennen die Chanés „yándurape", d. h. Straußweg, das südliche Kreuz nebst einigen nahegelegenen Sternen ist „yánduinyaka", der Kopf des Straußes, die beiden größten Sterne im Zentaur sind „yándupoy", Halskette des Straußes, die Venus heißt „coemilla", Morgen, Orion mit dem Dolche „hóirayúasa (Vögel begegnen sich). Ein anderes Sternbild ist „hoázupucu", Rehbockhorn, ein anderes „horévi" Tapir. Die Plejaden nennen sie „ychu", die Bedeutung des Namens wissen sie aber nicht, und dies ist das wichtigste Sternbild von allen.

Sitzt man mit den Indianern in der Hütte, so können sie den Platz der wichtigsten Sternbilder am Himmel bezeichnen, ohne sie zu sehen. Sie kennen ihre Lage zu allen Jahreszeiten.

Der Sternhimmel ist nicht nur die Uhr und der Kompaß der Indianer. Er ist auch ihr Kalender. Eine besonders wichtige Rolle spielen dabei hier, wie bei anderen Indianern, die Plejaden. Wenn sie zuerst in der Morgendämmerung am

Horizonte sichtbar werden, so ist die geeignete Zeit für die Maiwaat gekommen. Daß gerade dieses relativ unbedeutende Sternbild eine so große Rolle in der Astronomie der Indianer spielt, hat zu phantastischen Spekulationen über babylonischen Einfluß Anlaß gegeben.

Fragt man einen Indianer nach der Größe der Sterne und ihren Abstand von uns, so stehen sie unschlüssig da und antworten am liebsten gar nicht. Sie verstehen gleichwohl, daß sie weit entfernt sein müssen.

[illegible]

Chiriguanohäuptling Maringay erzählte jedoch, es war einmal ein Bruder, der mit seinem Schwesterchen spielte. Sie suchten sich zu haschen, sangen und sprangen. Nun sitzen sie als zwei Sterne am Himmelsgewölbe.

Zwei Sternhaufen im Süden des südlichen Himmelsgewölbes sind die Asche eines alten Mannes und einer alten Frau, sagte einmal ein Chiriguano zu mir. Es war eines Abends im August.

Die Sonne ist in der Sage ein Mann und der Mond eine Frau. Einem alten Mann, der Sonne, stahlen die Chanékinder das Feuer, und unter dem Tiru der Mondfrau verbarg sich der zweiköpfige Yahuéte, als er von dem Sohn des Gürteltiergottes verfolgt wurde.

Die Ab- und Zunahme des Mondes hing nach Maringays Erklärung davon ab, daß ein größeres oder kleineres Stück desselben in das Himmelsgewölbe gestreckt wird.

Die Sonne geht über dem Wasser auf und leuchtet uns dann am Tage. Am Abend steigt sie wieder ins Wasser, und des Abends leuchtet sie den anderen Menschen jenseits der Erde. So dachte sich Maringay den Lauf der Sonne. Ich glaube jedoch, daß er dies von den Weißen gelernt hat.

Wenn ein Meteor, „hareéndi", niederfällt, bedeutet es den Tod eines Häuptlings. Über eine Sternschnuppe sagten die Chanés am Rio Parapiti: „Er geht, um bei seinem Mädchen zu schlafen." Maringay war in seiner Erklärung realistischer. „Der Stern läßt etwas fallen", sagte der Alte.

6 Nordenskiöld SF10 Chiriguano

Wenn es donnert, geht Chiquitítunpa um. Die Medicinmänner, „ipáye", können Regen machen. Wenn die Schwalbe „mächuropúmpi", niedrig fliegen, regnet es, sagen die Indianer. Ein anderer Vogel, „chimcho", verkündet Regen. Reist man, so soll man nicht einen Krug ins Wasser stecken, sondern das Wasser mit einer Kalebasse schöpfen, sonst regnet es. In einer mir von den Chanés am Rio Itiyuro erzählten Weltuntergangssage geht die Welt durch Wasser unter. Die Chanés am Rio Parapiti erzählten mir, wie die Welt durch [illegible] wird. Auch spielen Wasser in den Sagen eine unbedeutende Rolle. Setzt man einen erwärmten Krug in rinnendes Wasser, so kommt Sturm, sagen die Chanés am Rio Parapiti. Der Regenbogen, „yö", ist eine Schlange.

[p. 297]

Achtzehntes Kapitel.

Aus dem Leben der Chaná- und Chiriguanoindianer (Forts.).

Die katholischen Missionen unter den Chiriguanos.

Allmählich müssen alle Indianer unter den Einfluß der Weißen kommen. Das ist unvermeidlich. Mit jedem Tage vermindern sich die Gebiete, in denen sie noch unabhängig leben. Sobald ihre Gebiete erobert sind, werden sie auf die eine oder andere Weise gezwungen, für die Weißen zu arbeiten und kommen in vollständige Abhängigkeit von ihnen. In der Regel werden sie auch schlecht behandelt, ausgesogen und moralisch verdorben.

Es ist deshalb ein Glück im Unglück, daß es aufopfernde Menschen gegeben hat und gibt, die etwas getan haben und tun wollen, um den Indianern zu helfen. Diese Menschen sind die Missionare. Es läßt sich nicht leugnen, daß diese eine bedeutende zivilisatorische Arbeit unter ihnen versucht und auch vorgenommen haben. Enthusiasmus und Wille zur Aufopferung sind erforderlich, um Missionar zu werden. Seines Vergnügens wegen kann kein Mensch sein ganzes Leben in Gegenden leben, wo die Einsamkeit auf die Dauer schrecklich sein muß und wo das Leben keine Zerstreuungen oder Genüsse gewährt.

Für den Missionar ist die religiöse Bekehrungsarbeit die Hauptsache. Er will die Seelen aus der Hölle „tatahuasuenda"[1]) erretten. Glücklicherweise sind die katholischen Missionare klug genug, auch ein wenig an dieses Leben zu

[1]) Tatahuasuenda = wo das große Feuer ist. Guaranisiwort, von den Missionaren erfunden.

6:Nordenskiöld SF10 Chiriguano

denken und eine Verbesserung der materiellen Daseinsbedingungen der Indianer zu erstreben.

Der Indianer, der ein unabhängiges Leben liebt, aber mit in den Zivilisationstanz hineingezwungen wird, will kein Missionskind werden, wählt dieses aber als das geringere Übel. In der Mission steht er unter Vormunden, aber nicht unter Unterdrückern.

Als mein Freund, der Chanéindianer Batirayu, von dem ich hier mehrmals gesprochen habe, mich fragte, ob es nicht das beste sei, die Missionare zu bitten, zu den Chanés am Rio Parapiti zu kommen, dachte er sie sich als Retter von der Bedrückung der weißen Herren.

Als ich den Chiriguanohäuptling Maringay fragte, ob er nicht wolle, daß die Missionare nach seinem Dorfe kämen, wurde der Alte ganz aufgebracht und sagte mürrisch: „Ich habe wohl nichts Böses getan."

Die größte Bedeutung der Missionare liegt darin, daß sie die Indianer von der Bedrückung und den Lastern der Weißen zu schützen suchen. Mit Freude habe ich gesehen, wie die Missionare den Branntwein, den verdammten Branntwein, in den Missionsstationen verbieten.

Ich glaube dennoch nicht an die Zukunft der Missionen. Sie scheinen mir zum Verschwinden verurteilt zu sein. In demselben Maße, wie die Indianer von den übrigen Weißen besser behandelt werden und für ihre Arbeit eine ordentliche Entschädigung erhalten, werden sie die Missionen verlassen und sich der Bevormundung der Franziskanermönche entziehen.

Immer aber werden die Missionare die Ehre haben, daß sie die Indianer wenigstens etwas vor den anderen Christen zu schützen versucht haben. Ehre haben sie auch mit den Studien, die sie über Sprache, Sitten und Gebräuche der Indianer gemacht haben, eingelegt.

Die Furcht vor den Gummigegenden.

In einem vorhergehenden Kapitel habe ich über die Wanderung der Indianer nach Argentinien gesprochen. Im nörd-

6:Nordenskiöld SF 10 Chiriguano

lichsten Gebiet der Chiriguanoindianer findet noch eine andere Auswanderung statt. Sie unterscheidet sich von der ersteren u. a. dadurch, daß sie nicht freiwillig ist. Es handelt sich um die Gummigegenden im nordöstlichen Bolivia. Jeder

Abb. 132. Chanékinder. Rio Parapiti.

Indianer, der nach den argentinischen Zuckerfabriken geht, weiß, daß er, wenn kein Unglück eintrifft, wieder zurückkommt. Keiner hält ihn mit Gewalt zurück. Von den Gummigegenden kommt dagegen niemals einer wieder.

Ist es wahr, sagen sie, daß dort ein Riese ist, der Menschen frißt? Ist es wahr, daß die Menschen zu Gummi ge-

6:Nordenskiöld SF10 Chiriguano

mahlen werden? Ist es wahr, daß das Fleisch, das in Blechbüchsen kommt, von Menschen ist? Dies sind Fragen, welche die Indianer an mich gerichtet haben.

Auf eine schamlose Weise sind die Chiriguanoindianer, besonders vom Caipipendital, nach den Gummigegenden im nördlichen Bolivia gelockt worden, wo sie als Arbeiter verkauft worden sind. Unter Bewachung bewaffneter Leute sind sie über Quatro-Ojos den Rio Mamoré heruntergebracht worden.

Über das Verhältnis der Indianer zu der Gummiindustrie habe ich jedoch bessere Gelegenheit in dem Buche zu sprechen, in welchem ich über die Studien, welche ich in den Gummigegenden selbst und unter den Indianern, die in der Nähe derselben liegen, berichten werde.[1]) Ich gehe deshalb hier nicht näher auf diese Frage ein.

Frondienste für die Weißen.

Die Chiriguanos und Chanés, die in ihrem eigenen Land bei der zugezogenen weißen Rasse als Diener arbeiten, sind außerordentlich schlecht bezahlt. Dies gilt besonders für abgelegene Gegenden, wo die infolge der Konkurrenz höheren Arbeitspreise in den argentinischen Zuckerfabriken nicht auf die Löhne haben zurückwirken können. Den Chanés am Rio Parapiti wird z. B. selten mehr als 20 Centavos (nicht ganz 35 Pf.) pro Tag nebst Kost bezahlt. Die Frauen verdienen ungefähr halb soviel. Der Verdienst wird den Indianern teils in Branntwein und Zucker, teils in Zeug und Werkzeug ausbezahlt. Das Zeug ist so schlecht, daß ein Hemd aus einem solchen Stoff nicht viel länger reicht, als die Zeit, die zum Verdienen desselben gebraucht wird. Infolge dieses Systems fangen auch die Chanés und Chiriguanos an, wie ihre Stammfreunde in den Gummigegenden im nordöstlichen Bolivia, der Schuldsklaverei zu verfallen.

[1]) Ist unter dem Titel „Indianer och hvita i nordöstra Bolivia", Stockholm 1911, auf Schwedisch erschienen.

6:Nordenskiöld SF10 Chiriguano

Zu hoffen ist, daß die vom Ingenieur Herrmann in Gang gesetzten großen Anlagen in San Franzisko am Rio Pilcomayo die indianischen Lohnverhältnisse im allgemeinen verbessern werden. Bezahlt er besser als andere, so kommen alle Indianer zu ihm, und die übrigen Arbeitgeber müssen die Löhne erhöhen.

Die Chiriguanos und Chanés sind somit auf dem besten

Abb. 133. Tongefäß. 1/4. Chiriguano. Caipipendi.

Wege, in den alles andere als glücklichen Kampf zwischen Arbeitgeber und Arbeitnehmer hineinzugeraten.

Die bolivianische Regierung sollte dafür sorgen, daß die Felder der Indianer ins Grundbuch eingetragen werden, damit die Weißen sich nicht ihrer bemächtigen können. Die Regierung müßte auch die Bedingung aufstellen, daß kein Indianer sein Land verkaufen darf. Auf diese Weise würde die Regierung den Indianern das Besitzrecht am Lande, aber nicht das Eigentumsrecht an demselben zusichern.

6:Nordenskiöld SF10 Chiriguano

Die Unsicherheit und die gedrückten Lohnverhältnisse, unter denen diese Indianer leben, tragen natürlich zur Auswanderung nach Argentinien und vor allem dazu bei, daß viele Indianer das Land nicht nur als Saisonarbeiter, sondern für immer verlassen.

Will die bolivianische Regierung etwas für die Indianer tun, so muß sie in erster Reihe ein Mittel gegen das schlimmste Übel, und zwar den Alkoholismus, zu finden suchen. Zwischen Maisbier- und Branntweintrinken ist nämlich ein ungeheurer Unterschied.

Ein Indianer, der sich in einheimischen Getränken betrunken hat, ist niemals so auf Streit und Schlägerei erpicht, wie derjenige, der von der Höllensuppe der Weißen gekostet hat. Außer daß der Branntwein die Moral und Gesundheit der Indianer schädigt, ruiniert er sie vollständig. Ich habe mit meinen eigenen Augen gesehen, wie ein Indianer für ein Fäßchen Branntwein seine beste Kuh hergeben kann.

Die Brennerei für den eigenen Bedarf ist in Bolivia noch gestattet. Sie müßte verboten werden, ebenso, daß jeder an beliebiger Stelle Alkohol verkaufen darf.

Ganz unvernünftig ist das bolivianische Militärgesetz, das die Indianer zwingt, Militärdienst zu verrichten. Dasselbe kommt zwar sehr selten zur Anwendung, wenn es aber geschieht, und wenn die Behörde einen Jüngling zum Militärdienst abholt, ist er selbst und alle anderen Indianer in der Gegend mit ihm außer sich vor Schreck. Man kann nicht verlangen, daß die Indianer an der Verteidigung des Vaterlandes teilnehmen, bevor sie dieselben Rechte wie andere Bürger haben und wissen, welches ihr Vaterland ist.

Es ist unrecht, zu verlangen, daß sie helfen sollen, Bolivia zu verteidigen, die Weißen zu verteidigen, die ihnen, ihren Begriffen nach, ihr Land gestohlen haben. Auch die Chiriguanos und Chanés lieben ihr Land, aber dieses Vaterland sind nur die Täler und Wälder, in denen ihre Väter gerodet und ihre Mütter Tongefäße für die Feste gemalt haben.

Während der Entwicklungsperiode, die Bolivia jetzt durch-

6:Nordenskiöld SF10 Chiriguano

macht, ist es wichtig, sich die indianische Arbeitskraft auch hier im Lande der Chané- und Chiriguanoindianer zunutze zu machen.

Trotz ihrer eigenartigen Kultur setze ich keine großen Hoffnungen auf die Zukunft der Chiriguano- und Chanéindianer. Sie werden indessen als ein wichtiges Element der Mestizenrasse einverleibt werden, die in Zukunft allein über die Trockenwälder des Parapititales und die letzten Ausläufer der Anden nach El gran Chaco herrschen wird.

Allmählich vergessen sie wohl ihre Sagen von Tatutunpa und Aguaratunpa und den anderen Göttern.

Die Nachkommen Maringays, Vocapoys und der anderen werden dann vielleicht studieren, was über ihre Vorväter in diesem Buche geschrieben ist, das in einem Lande gedruckt ist, wo der Mais nicht reift und die Palmen nur unter Glas wachsen. Sie werden vielleicht nach Norden fliegen, um die Schmucksachen zu sehen, mit denen die Alten bekleidet waren, und die schöngemalten Trinkgefäße, in welchen ihre Stammütter das Maisbier zu den Festen gereicht haben.

CHAPTER VII.

The Chiriguano (I).

Ethnographical research among the Chiriguano. The Chiriguano country. The tribal name. Physical qualities. Dwellings. Pile-built granaries. Theories as to the origin of the practice of erecting buildings on piles. Fireplaces. Household furniture. Dress. Modes of dressing the hair. Face-painting. Ornaments. 880

During our journey from Tarija to Gran Chaco we came into touch with the Chiriguano Indians, and on the march, as well as during our stay in the Chaco-Andean border region, I was successful in getting together a small but valuable ethnographical collection from these Indians. It is in connection with the publishing of the most important type specimens of this collection that I consider it suitable to give a brief description of the Chiriguano mode of living. Only in one or two cases, where I have arrived at results diverging from those of other students, have I found it necessary to enter into fuller details. 114

Mention of the Chiriguano tribe has, already in the 15th and 16th centuries, been made by a number of writers, and it is especially in Franciscan mission literature, earlier as well as later, that much valuable information may be found as regards this tribe.[1] Among the literature on the Chiriguano that had been produced prior to our journey, it may be that the books written by Corrado[2] and Serrano[3] are those that best repay perusal, and of works subsequently published, those by del Campana[4], Lehmann-Nitsche[5], Outes[6], Nino[7] and Nordenskiöld[8] are especially valuable. 113 114

[1] A very full list of works dealing with the Chiriguano is to be found in Nordenskiöld (11) and (18).
[2] Corrado (1).
[3] Serrano y Sanz (1).
[4] del Campana (1).
[5] Lehmann-Nitsche (1).
[6] Outes (1).
[7] Nino (1).
[8] Nordenskiöld (11), (18), (18) and (14).

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these culturally allied tribes. After the last great Indian rebellion against the whites (in 1890), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly gourd plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Parapiti.[2] The name of Chiriguano (quichua), which means »dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word »guano» is the name for the well-known bird manure-found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Puna and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

[P. 190 is blank]

142 To me, the Chiriguano seemed to be of better physique than both the Puna and the Chaco Indians, and their cast of features, as a rule, to be less rough-hewn than those of the above-mentioned tribes. Herma ten
141 Kate has taken anthropological measurements of four Chiriguano men,
[127] whose average height was determined at 160.1 cm.[1] Lehmann-Nitsche, who has made anthropological observations of 50 Chiriguano (40 men and 10 women), is my authority for the data I have grouped together in the subjoined table.[2]

The Chiriguano; some physical data.

Sex	Average height, cm	Shape of skull	Colour of skin, Luschan's scale	Colour of hair, Fischer's scale	Iris, by Martin's scale
Men.....	163.4	Dolichocephalic — mesocephalic	Majority 22	Majority 4	Majority 3—4
Women.....	151.7	Dolichocephalic — mesocephalic	Majority 18	Majority 4	Majority 3—4

142 The Chiriguano complexion is, accordingly, brown with a tint of yellow; the iris is dark brown, the hair black, coarse and lank. The growth of hair on face and body is very scanty.

361 The Chiriguano are not a nomadic people, but live in permanent villages, some of which are the abode of only a few families, whilst others contain
[114] several hundreds of inhabitants. At Ibitibi I was studying a Chiriguano village that, according to the Indians, was inhabited by about 300 people. This village was situated on a plain surrounded by wooded mountains (fig. 188). The huts formed a large circle, with the chief's hut in the centre. In the open space between the chief's hut and the rest, there were growing some close-foliaged trees (probably of the Bignoniaceæ
[574] family), affording much-needed shade. In earlier literature it is stated that
[609] the Chiriguano used to build a hut for strangers in the middle of the village plaza.[3] In many of the Chiriguano villages I visited, the huts were scattered about without any perceivable order.

342 The huts are rectangular and with ridged roofs. (Figs. 188—192.) The walls either consist of perpendicular sticks, of tree-branches or reeds,

[1] Ten Kate (1), p. 26.
[2] Lehmann-Nitsche (1).
[3] Nordenskiöld (12), p. 2.

342 placed close together and fastened with withies lashed on horizontally (figs. 189 and 190), or of branches woven together and daubed with clay (fig. 191). The roof, the construction of which is apparent from fig. 217, is thatched with grass. This is an especially interesting *method of roof-construction, used in Peru already in the pre-Columbian period*, a fact plainly evident from an ancient Peruvian vase-painting[1] (fig. 193). The walls and the roof are supported by a hut frame consisting of poles (fig. 217). 2 A

Fig. 188. Part of a Chiriguano village. Two small pile-buildings, used as maize-barns can be seen between the huts. Ibitibi. Bolivia. Photo. E. v. R.

343 The granaries for storing maize are always built on pole supports
417 (figs. 188 and 192). Fig. 191 shows a step-ladder leaning against a tree.
[322] Step-ladders of this kind, usually hewn out of a single piece of wood, are used by the Chiriguano as means of access to these pole-supported granaries.

174 Baron E. Nordenskiöld, who has made a valuable analysis of the distribution
342 of pile-buildings in South America[2], considers that when pile-buildings occur among a tribe inhabiting a region not exposed to inundations, then the idea of constructing buildings raised on piles has generally originated at the time when the tribe inhabited some other region, either a swamp,

174 342 [114] or a district threatened with flooding through rainfall or the flowing in of the oceanic tide. In my opinion, however, this has usually not been the case.

342 343 825 174 [171] According to my thinking, it is the fear of predatory animals that has given rise to the pile-construction idea. Those granaries built on pole-supports, that are so commonly met with in widely different countries, have, we know, as a rule been constructed for the express purpose of furnishing protection against noxious animals, such as lesser carnivora, rodents and insects. As an example, the »njalla» of the Lapps is built

342 343 825 171 174 as a protection against wolverines[1], and many of the native tribes of Africa erect their food depositories, or grain bins, on pole-supports to make them safe against mice and white ants.[2] Both the Balenge people, who inhabit a fairly arid country, and the Babisa, who live on the edge of the Bangweolo swamp, build their corn bins on piles.[3] As the Babisa often build their huts on a platform of beaten clay[4] (not piles, it will be noted) as a protection against the annual heavy floodings of the rainy season, this will naturally give rise to the supposition that the Babisa

granaries, at any rate, are raised on supports in order to keep the stored crop from getting wet. That such is not the case will, however, be apparent from the fact that the granaries are empty during the time of the rains. It should be remembered that, in these parts, the period of vegetation coincides with the duration of the rainy season, and that the crops are harvested and stored only after the cessation of the rains. During the time the grain reposes in the granaries no rain falls at all, and on that account the granaries of the Balenge are often unprovided with a roof.[1] Moreover, Babisa, as well as Balenge, stated that the pile-built grain bins were constructed solely as a protection against damage to the corn from rats and white ants. The practice of erecting buildings on piles as a safeguard against flooding is entirely non-existent in the Bangweolo region.

Fig. 193. Ancient Peruvian hut. Vase-painting. After Joyce.

The fundamental idea of storing food in structures built on piles may, in my opinion, be traced back to the custom of primitive peoples of keeping freshly killed meat, and other food, safe from depredation by larger or smaller raiding animals, by suspension on trees. The »njalla», which is erected on a single pole, or on the lopped stem of a growing tree left on its root, may, I think, be taken to be a development of the primitive tree cache. The four-poled Lappish larder called »luopte», or »luove» (cfr. the Swedish words »loft», and »lave»), is on the other hand most probably an imitation of the »hebrä» stores of the land-settled folk, which, presumably, also have received their pile-building construction with a view to forming a protection against noxious animals. For the »hebrä» is probably nothing but a development of the »lave». In order to keep divers implements safe, not only from wild animals, but also from mischievous domestic cattle, such as goats, it is sometimes necessary to construct at the homestead a »lave», the floor of which is either supported by three or four rooted tree-stumps, or by poles driven into the ground (fig. 189). When it is desired to shelter the stored utensils from rain, a roof is built at a suitable height from the floor, and if a still more effective shelter is required, the space between the floor and the roof is filled in with walls. At the stone-age

[1] von Rosen (4), fig. 325.

experiment carried out at Rockelstad in the summer of 1909[1], the» stone-age men» soon found themselves compelled to build a »lave» so that the goats should not damage such foodstuffs and implements as had to be kept outside the hut.[2] 342 343 825 171

It is my belief that the »lave» has also supplied the idea of building dwelling-houses on pole-supports. Wherever people in a certain stage of civilization have found themselves settled on solid ground, they have had need of raised food-platforms, partly for keeping their foodstuffs safe from damage on the part of domestic as well as noxious animals, partly for the purpose of drying, smoking or roasting the food (see pp. 38, 47 and 48). If such a people, living on the edge of a lake or a swamp, had wished — for defensive purposes or some other reason — to build their dwelling-huts or other buildings in the water, then, if the bottom of the lake afforded good holding for piles, such buildings would have been constructed in the same way as the food-platforms or pole-supported granaries previously employed on firm ground (compare fig. 28 with fig. 115). Where the people in question has been lacking in sufficient skill to construct large pile-buildings in the water, or if the lake bottom was unsuited to this mode of construction, then huts were built on rafts or quagmire islands, after the manner of the swamp dwellers of Alvastra and Bangweule.[3] 174

The furnishing of the Chiriguano huts is exceedingly plain. The fire-place, which forms a very necessary heating centre at night during the cold season, consists of a few stones serving as supports for the cooking pots. There is no hole in the roof for letting out the smoke, which has to find its way out through the doorway or through fissures in the walls. As a rule, the food is generally cooked on a fire outside the hut (fig. 189). 354 [254]

Bedsteads of the type seen in fig. 190 are to be found in nearly every hut. These bed frames are made of laths or reeds, and are covered with skins. Nordenskiöld states as his opinion that the idea of these bedsteads *has not been borrowed from the civilization of the whites.*[4] *In the analytical* treatise he has written upon this question he adduces conclusive arguments for his opinion, as it seems to me. In Central Africa, one finds bedsteads that are very similar to the Indian ones,[5] and that certainly have not 352 114 [171]

352 [114] been imitated from the Europeans. The Chiriguano also sleep in hammocks [171] made of cotton yarn, and on reed mats and skins spread on the ground. [513] Stools for sitting on I have not observed among the Chiriguano. They do, however, possess such articles of furniture,[1] which, however, must be of 353 considerable rarity. Along the walls of the hut will be seen an orderly 415 array of cooking and roasting pots, water pitchers, and pots for maize [531] beer, arranged in rows, often of exceedingly beautiful shape and with painted decoration (figs. 217—225). From wooden hooks in the roof are hanging bunches of maize cobs, pumpkins or other foodstuffs; arrows, bows, and other gear. From the roof there are also suspended clay bowls (figs. 224 and 225), used as repositories for smaller articles of value. Clothing, ornaments, and such like, are also stored in large clay jars placed on the ground. As bowls there are also used the scaly skin of armadillos, and calabashes (fig. 226).

[352] [291] [302] [411] [415] [237] [224] 354

Fig. 170. Man and young woman, Chiriguano, San Luis, Bolivia. Photo. E. v. R.

Outside every hut there is, as I mentioned, a fireplace which is generally used for cooking the food, unless the weather makes this im- 356 possible. The huts, as well as the open spaces between them, are kept particularly neat and clean. They are swept every day, and the sweepings are burnt. The huts are practically always free from vermin.

291 The Chiriguano men nowadays generally wear shirt and trousers of [177] European cut (fig. 194). The poncho shirt is, however, still to be met with among this tribe[2], but only very rarely, and I have never personally

[1] [illegible] (16), p. 189 and fig. 85 (18), pp. 13 and 16, and fig. 3.
[2] [illegible] (16), p. 30.

seen any Chiriguano using this typical ancient Andean garment. Ponchos of the cloak type, and robes of the kind used by the Chaco Indians, on the other hand, I have seen worn by the Chiriguano men, who put them on against cold and wet. Formerly the Chiriguano men dressed in the «chiripa», which was a rectangular skirt that was fastened in front to a cord tied round the waist, then passed between the legs, and fixed to the cord above the buttocks. One may still see, here and there, some small boy wearing nothing but this primitive garment. On their heads the men often wear a broad, red, turbanlike frontlet (fig. 194), and, when setting out on long marches, they put on their feet sandals, the straps of which bear distinct resemblance to straps on sandals that have been found in ancient graves on Puna de Jujuy.[1]

Fig. 195. Chiriguano boy with long, flowing hair. San Luis, Bolivia. Photo. E. v. R.

The women also possess sandals, but, like the men, generally walk about barefooted. The women's clothing consists of a loose-fitting, tubular garment made of woollen, or cotton, stuff. It is called «tipoy». The upper part of it is pinned together over the shoulders by means of cactus spines or metal pins, in the manner seen in fig. 190, which leaves the arms free, or the garment may be fastened under the armpits in the way the girl in fig. 194 is wearing it.

Nowadays the men mostly wear their hair bobbed, and with a frontal fringe (fig. 194), but I have seen boys, not fully grown, with long hair, hanging loose down (fig. 195). In former days all the men had long hair, which they gathered on the top of the head, where it was secured with a frontlet, a custom not yet quite discarded in some out-of-the-way parts of the country. The women let their hair grow long, give it a centre parting on the top of the head (fig. 190), plait it into tresses and tie it up, or allow it to hang loose. One may sometimes see girls with short hair (fig. 194), but in such cases the hair has been cut short as a sign that its owner has entered upon her first menstruation. On the death of a near relative it is also the custom of the women to cut off their hair.

Fig. 196. Wooden comb. Chiriguano. Bolivia. 7/8 Eleon. ep. p. Eo.

[1] [illegible] (18), fig. 23; von Rosen (2), fig. 84.

4/8 [footnote 1 appears on p. 200 - - 9 n.]

302 The hair is tended with very neat-looking wooden combs (fig. 196).
[412] Among the Chiriguano I also noticed composite combs of the type used in the Chaco (fig. 85).

[386] Among the men as well as the women, the custom obtains of painting
[824] the face red, the pigment being prepared from Bixa orellana. Many of the men I met in the neighbourhood of San Luis had red-painted the whole face below the eyes, and some of the women had circular red
302 spots, about 3 to 4 cm in diameter, painted on their cheeks. On the
304 other hand, I did not see any tattooed Chiriguano. Instances of tattooing have, however, been noted by Nordenskiöld, who also has seen Chiriguano women who had stained their teeth dark blue with some vegetable extract.[1] In the past, tattooing as well as teeth-staining were commonly practiced by the Chiriguano.

301

Fig. 197. Lip-stud (tembeta) of tin, with inlaid, pinned, turquoise-coloured glass-beads. Chiriguano, Bolivia. *. Rikes. 25. 3. 800.

Another Chiriguano ornament intimately connected with the human body is the lip stud («tembeta»), which is exclusively worn by men and by youths who have attained marriageable age. The Chiriguano lip stud of the present day consists of a hollow tin cylinder with two laminate projections (fig. 197). The cylinder is filled with some waxy substance, into which are embedded a number of small beads of stone, glass or porcelain, usually of a turquoise-blue colour. The lip stud is inserted from the inside, through a hole made in the lower lip, so that its circular, bead-beset, front surface barely shows beyond the skin of the lip. The base of the lip stud, which is slightly concave, then rests against the teeth of the lower jaw. This quaint ornament creates no displeasing impression, but should a Chiriguano take it out, he would look both pitiable and ridiculous, as the saliva then runs through the large hole in the lip. Hence it is considered disgraceful to be seen without the lip stud, and on many occasions I have noticed the women scornfully deriding such men as had sold their lip ornaments. As soon as a man had taken out his lip stud, he generally put his hand to his mouth for concealment until he had time to put in a substitute stud, usually made of wood.

The lip stud that is here shown, which weighs 18.1 grammes, has a base plate 3.4 cm long, and its cylinder is 1 cm high, with a diameter

[1] Nordenskiöld [22], pp. 83, 85 and [18], pp. 187–188.

of 1.1 cm. It is decorated with one large and many small, turquoise-blue beads made of glass or porcelain. 301

Necklaces of stone or glass beads are worn by the women, and even men may occasionally be seen with them. One such necklace (fig. 198), which I bought of a Chiriguano Indian in the San Luis district, consists largely of pierced, cylindrical or laminate, turquois beads of exactly the same kind as I found when excavating the ancient site at Tolomosa in the Tarija valley.[1] The Chiriguano keep all stone beads they happen to pick up on the ground, and also acquire them by barter from other districts. Besides turquoise beads, there are also blue, white, and red glass-beads threaded on this necklace, which to me proved a particularly costly bargain. It is probable that such necklaces as wholly or in part are composed of ancient beads are looked upon as amulets. To this question I shall refer later, in connection with my account of the supposed magical properties of certain Chaco[illegible] objects. [437]

Fig. 198. Necklace of turquoise and glass beads. Chiriguano. Bolivia. Tr. Ethnm. 1/3 [illegible]

Fig. 199. Tweezer-like breast ornament of silver. Chiriguano. Cuyupunda, Bolivia. Tr. After Erl. Nordenskiöld. [72] [789]

In the important work entitled «Comparative ethnographical studies», Erland Nordenskiöld describes, from the Chiriguano, an interesting breast ornament called «beiviru» (fig. 199), which I have not myself seen in use. It is of silver, doubled over tweezer-fashion, and worn on a string round the neck. Such tweezers, usually ornamented, are nowadays not put to any practical use, but exclusively worn as ornaments. The leaves of these tweezers are, therefore, sometimes hammered together. On good grounds Nordenskiöld advances his opinion that these ornaments originate from the small tweezers, or pincers, that, already in pre-Spanish times, were used by the Andean Indians for removing hairs of the beard, or 381 174 412 (302)

[1] see Rosen (I), p. 362 and fig. 350: 13–17.

301 (179 412 (302)) other inconvenient hair-growth, and which are still in use among the Chiriguano.[1]

I have noted a circumstance, previously unheeded, that, in my opinion, gives considerable weight to Nordenskiöld's theory as to the true Indian origin of the boivéra ornament. All breast ornaments of this kind have in their upper part a tubular horizontal perforation, open at both ends. In the middle of this barrel, and through the top, there is a hole. Through this barrel and upper hole is run the cord by which the ornament is worn round the neck (fig. 199). This rather peculiar arrangement for fixing the cord on which the ornament is hung, is found in the majority of such ancient Indian hanging ornaments, whistles and flutes of stone, as were meant to be worn a string. As an example, the remarkable ancient Indian stone flute, found in the earth in the vicinity of Iruya,[2] has at one end been bored through (fig. 200) in a manner exactly corresponding to the arrangement for the cord in the boivéra. This cord-fixing adaptation does not, to my knowledge, occur in any European object. For this reason it may surely be considered as very probable, not only that the original use of the boivéra as a pair of tweezers is of Indian origin, but also that the idea of carrying the tweezers on a string round the neck is Indian, and consequently has not originated from those more or less «white» jewellers that nowadays manufacture boivéra ornaments, and sell them to the Indians. I have in another book depicted a fragment of a small, pre-Spanish, ornamented bronze tweezers, which, like the boivéra, has a circular perforation at its upper end,[3] indicating that those tweezers, too, were worn on a cord, and consequently also in all likelihood served as a breast ornament.

[534] [172]

Fig. 200. Two views of stone. Ground-half from Iruya, Bolivia. ½. The detail has marks the hole for fastening a string in the same way as for the breast ornament, fig. 199.

CHAPTER VIII.

The Chiriguanos (2).

Industries. Cultivated plants. Hunting. Fishing. Vessels for food and drink. Intoxicants and stimulants. Music and dancing. Social order. Customs governing marriages, childbearing, illnesses, death and burial. Character and temperament. Belief in metempsychosis.

The Chiriguano are mainly an agricultural people, but they also do a certain amount of hunting and fishing. Maize is the most important of their cultivated plants, and it is very extensively grown by them. Many other Indian domestic plants are also cultivated, viz. pumpkins, sweet potatoes, beans, mani, cactus with edible fruit (Opuntia), tobacco, cotton, uruku (Bixa orellana), and a reed plant (Arundo donax) for making arrow-shafts. Of imported cultivated plants grown by the Chiriguano, I have seen melons, water melons, sugar cane and oranges. According to Nordenskiöld, they also grow figs and millet,[1] these latter of course also having been introduced by the whites. Nowadays, European spades and hoes are used for loosening the soil. Among wild-growing food plants the algarrobo tree (Prosopis alba) is, to the Chiriguanos, the most important one. The Indians also prepare from the fruit of this tree an intoxicating drink to which they are much addicted.

The Chiriguano larder does not to any great extent depend on hunting the game, but formerly hunting must certainly have been an important source of subsistence. Snaring is, nowadays, the 'only' method of hunting employed by the Chiriguano. The long-bow, the pellet-bow, slings, bird-nets and clubs are still occasionally used in hunting.

In olden times the Indians were good shots with the bow and arrow, and, according to Lizarraga, they then used bows the height of a man.

Longbows. Chiriguano. Bolivia. About 1/7.

On the left wrist they wore a small piece of wood as a protection against the blow of the bowstring.[1]

Curiously enough, the present-day Chiriguano type of bow does not seem to have been exhaustively described by anyone; not even in Schmidt's account of South American bow types,[2] otherwise so exact, is there any mention of the Chiriguano bow. The reason for this may very likely be found in the circumstance that these weapons are said to be of rare occurrence nowadays, and that such few specimens as are still being made, are mostly used as toys and on that account typologically degenerated. Twenty years ago, when I travelled through a part of the Chiriguano country, the bow was, however, not so rarely seen as a hunting weapon as now, and I collected the seven specimens now reposing in the ethnographical section of the Riksmuseum at Stockholm. Beside these, there are two Chiriguano bows brought home by Baron Nordenskiöld, one of which is a toy bow. Two other toy bows that have been brought to Sweden by Nordenskiöld belong to the Gothenburg Museum. This forms the material from which I have compiled the following description of the Chiriguano type of bow.

By their string-fastening arrangement the Chiriguano bows differ from the Chaco-Andean bow types, which latter as a rule have no neck-shaped bow-end projections for the string. On the other hand, all Chiriguano bows that I have studied, even the toy bows, have neck-shaped ends for fastening the string, a circumstance indicating that the Chiriguano bow is no acquisition from Chaco-

[1] de Lizarraga (1), p. 328. From Erl. Nordenskiöld.

411

Andean civilization, but is of a type that the Chiriguano themselves brought with them.

The bow staves, of which figs. 201 and 202 represent typical specimens, consist of an exceedingly resilient — though gnarled — kind of wood. As seen from the table here given, the lengths lie between 115 and 145 cm. The longest of the bows examined by me are therefore about 2 dm shorter than a Chiriguano Indian of average height (see table on p. 191), which goes to show that this type of weapon has grown smaller since the days of Lizarraga.

Chiriguano bows.

Riksmuseum catalogue No.	Stave Material	Length of stave, cm	Bow stave centre section	String-fixing arrangement	String material
03. 3. 854	Hard, resilient, gnarled wood	145	Type as in fig. 203	Stave-end pared down to a neck	Twisted rawhide
03. 3. 850	»	143	»	»	»
03. 3. 855	»	136	»	»	»
03. 3. 856	»	135	»	»	»
E. 660	»	123	»	»	»

03. 3. 853	»	115	»	»	»
03. 3. 851	»	119	Type as in fig. 204	»	»

The string side of the Chiriguano bow is plane or very slightly convex, and the front side convex, which gives the stave section the shape shown in fig. 203. Only one of the bows examined, fig. 202, has a differently shaped section, which is seen in fig. 204. It is worthy of remark that two bows (Nos. 03. 3. 850 and 03. 3. 854) are of a low reflex type, i. e., the stave, when the bow is unstrung, assumes a slight curve in the direction opposite the one it has when strung. From the way the string is put on, it is evident that the stringing has not been altered, so that the reflex type is not merely apparent. It is also possible that some of the other Chiriguano bows I have examined have originally been of reflex type, but that the staves, from tight stringing for a long time, have lost their original elasticity. It seems to me, however, most probable that these bows have acquired their reflex character unintentionally. As a rule, the reflex type is

Fig. 203. Section at centre of bow stave, fig. 201. 1/1.

Fig. 204. Section at centre of bow stave, fig. 202. 1/1.

411 unsuited to wooden bows, although, on the other hand, it is useful in the case of built-up bows, and bows made of horn.[1]

411 284 For the purpose of fastening the string, the staves have been given neck-shaped ends, one of which often is longer than the other (fig. 205, a and b). The string, which consists of twisted rawhide, is fastened to the shorter neck end with a knot (fig. 205, a), or a loop, then wound round the other neck end, in the way seen in fig. 205, b. When not in use, the string is slackened on the bow. When the bow is to be used, the stave is stood on the ground, for purchase, when it can be bent as much as is desired, and then the slip-knot (fig. 205, b) is pulled tight. When the bow is strung taut, the slip-knot is locked, so that, when unstringing the bow, one compresses it against the ground in order to slacken the string; the slip-knot is then easily loosened, and the string lengthened as required. When the bow is not being used for shooting, this way of treating it rests the stave, and tends to preserve its elasticity. In shooting, the bow is held with the string-wound part downwards (see figs. 201 and 202).

Fig. 205. String ends, and string-end loops of longbow shown in fig. 202. $^{2}/_{3}$.

411 The arrows are long, sometimes as long — or even longer — than the bows. As to their size, and other particulars, this may be seen from figs. 206—214, and the table on p. 211.

In the lancet-shaped heads of arrows of the types seen in figs. 206 and 207, the tang is pushed into a wooden arrow-head socket, the forepart of which is cleft. The rear end of the socket is fitted into the hollow fore end of the reed shaft. The socket is wound with string, so that its cleft part is kept tightly pressed against the tang, which latter often is smeared with beeswax, so as to make it stick firmly in the cleft. In order to give an increased firmness to the string-lashing, this is also heavily waxed, and so is the part of the socket that is fitted in the shaft. Iron arrow-heads [177] of this type have probably been copied from the lanceolate wooden arrow-heads that are still in use among the Chanés.[2]

[1] Longnon and Walmond (1), pp. 48—49.
[2] Vide arrow-head, fig. 6 A, Nordenskiöld (12).

All arrow-shafts have the forepart strengthened by a waxed lashing of bast or string, of a width from 5 to 11 cm. The rear end of the shaft is generally also reinforced with a waxed lashing, applied immediately above the string notch. This latter lashing is usually about 1 cm wide. In those of the arrows here reproduced that seem to be without notch-end lashing, this has become detached, except in the case of the arrow in fig. 40, which never was provided with a lashing of this kind.

I have mentioned in the foregoing that the Chiriguano cultivate a kind of reed plant (Arundo donax) in order to obtain therefrom a suitable material for making arrow-shafts. In making a reed into an arrow-shaft, the arrow-head is fitted to the thicker end of the reed (the lower part of the growing reed), because in this way, when the arrow is being discharged, the joints glide more easily over the bow stave than if the thinner end of the reed were turned to the front. The reed joints are, moreover, smoothed down with some sharp instrument in order to lessen the friction between arrow and stave. Arrow-shafts of a certain very light kind of wood are used by the Chiriguano of San Luis. Such wooden shafts I only saw on the long bird and fish arrows. I have never observed either arrow poison, or feathering on arrows, among the Chiriguano, but Nordenskiöld has seen feathered Chiriguano arrows.[1]

For bird-shooting the Chiriguano use arrows with club-shaped, wooden heads. The striking-face of this blob-head is usually slightly conical, and sometimes given a small, cylindrical projection (fig. 212). This type of arrow-head has been constructed for the purpose of preventing the arrow — if it misses its object — from fixing itself in the stem or branch of a tree, and of making it instead drop to the ground. As birds frequently are sitting high aloft in the trees, the hunter would not have much chance of recovering his arrow, on missing his bird,

if the arrow had not been given such a blob-shaped head. The force with which this lumpy head strikes its object, is sufficient to kill a middling-sized bird, provided the range is not too wide. The projection is intended for penetrating the feathers of the bird, so that the arrow shall not glance off the smooth plumage if the arrow should strike the bird at too acute an angle. These lumpy-headed arrows do not, as a rule, pierce the skin of the animal hit, which may be of advantage in killing small game.

411
177
174

The pellet-bow is also used by the Chiriguano. Whether it forms a constituent part of South American culture, or whether it has been introduced from India or Europe, is a question not conclusively settled. For my part I consider it probable that also in South America this weapon is an independent invention, but that the type (especially as regards its chambering) possibly may have been subjected to influence from the *European* pellet-throwing crossbow.[1] The fact of the pellet-bow being, apparently, of more common occurrence on the Chaco than elsewhere, may be explained from proximity to the Andes, and influence from Andean civilization. Within the area of ancient Peruvian culture, the stone sling was the most important distance weapon, and we may be quite sure that the nations then inhabiting the wooded spurs of the eastern Andes got to know the stone slings of the mountain folk. In forest regions, however, slings are unpractical weapons, as, in the whirling preliminary to the throw, they are apt to get caught in tree branches. The idea of using pebbles as projectiles instead of arrows, has however been adopted by the forest-dwelling tribes, who have tried to convert it into shooting with the bow. A stone that has been shot away does not need to be retrieved, but the loss of an arrow is always a serious matter! To my mind, it is in this manner that the pellet-bow of South America has originated. In districts where there are no stones, as for instance the greater part of the Chaco, clay pellets are used instead of stones.

As an argument in support of the view that the pellet-bow is not originally a South American weapon, it has been pointed out that it is not found in Peru, Central America, or Mexico. Its absence in Peru is easily explained, as this country is in its greater part almost entirely treeless, so that here the stone sling would be a weapon so infinitely superior to the pellet-bow that the use of the latter would be purpose-

[1] For discussion of this matter, vide: Nordenskiöld (11), pp. 50—53. von Rosen (5), pp. 170—180. Nordenskiöld (12), pp. 96—30.

less. For the rest, the pellet-shooting long-bow is, compared with the pellet-shooting crossbow of the Old World, in any case a pretty poor weapon, both for war purposes and for hunting, which may explain its inconsiderable distribution even in well-wooded districts. Where this weapon nowadays occurs, it is only used for killing small birds, for target practice, and as a toy.

Fishing is carried on in the water courses with which the country is sparingly supplied. The Indians use hooks, nets, fish traps and weirs. These fishing methods are, however, almost exclusively used for fishing in rivers or largish bodies of water. In shallow streams and rivulets, the fish are shot with arrows, or speared with a two-pronged fish-gig. Fishing with poison is also said to be made use of.[1]

A fish trap consists of a large, bottle-shaped calabash, wide in its lower part, but with a narrow neck. The trap, which is placed under the lee of a few boughs stuck into the river bottom, must not be set in deeper water than makes it possible for a wading person to reach the neck of the calabash. Ground bait, consisting of crushed, sour, maize, is put into the calabash. The fish will then collect inside the calabash, and the fisherman has only to carefully raise the trap out of the water. In the sandy river banks ponds are dug, and connected by a small channel with the river. When fish have collected in the ponds, the connecting channel is blocked up, the pond emptied of water, and the fish gathered up.[2]

Fig. 216. Detail of the fish spear in fig. 215. The prongs are of hard wood. Chiriguano. San Lain, Bolivia. Coll. Bolivia, No. 3 [illegible]

Among the Chiriguano Indians I visited, fish-shooting was a common practice. For this they used their smallest and weakest hunting bows. But it is also possible that those light bows I saw being used for shooting fish with, were exclusively employed for that purpose. If so, then the bow in fig. 202 is a fish bow. The arrows are long, and are usually provided with

[1] [illegible] (18), p. [illegible].
[2] [illegible] (18), pp. [illegible] and [illegible].

411 [226] two barbed prongs made of some hard wood (figs. 213 and 214). The arrow in fig. 210, which has only one prong, is used both in hunting and [824] for fish-shooting. The Chiriguano also use fish arrows pointed with a number of cactus spines.[1]

The fish spear has in later times become a very scarce implement with the Chiriguano. The only specimen obtained, as far as I know, is the one brought home by me, and now belonging to the Riksmuseum in Stockholm (figs. 215 and 216). Erland Nordenskiöld, who has compiled [114] a map of the distribution of the fish spear in South America, has been kind enough to inform me that the only mention he has come across in the literature, concerning its occurrence among the Chiriguano, is to be found in the account of the Viceroy Francisco de Toledo's unsuccessful expedition against these Indians.[2]

The fish spear I came upon among the Chiriguano in the neighbourhood of San Luis, has a 260 cm long shaft, made of some light kind of wood, very free from knots,[3] at one end of which two barbed wooden prongs are lashed on by means of a thin leather thong. The full lengths of the prongs are, respectively, 32.1 and 31.5 cm, and they project 20.0 cm from the shaft. One of the points has, however, been of a somewhat greater length, but has got blunted off. Both points have seven barbs on their outer sides. To ensure a perfectly firm fastening of the prongs, the fore end of the shaft has been wrapped with a piece of cloth, and over this the prongs have been lashed on.

323 I have already enumerated the various kinds of Chiriguano household [462] furniture. Among them, clay vessels hold a very important place. The Chiriguano are clever potters. It is only the women, though, who work at this industry.

In fig. 217 we see a potter's workshop, with a number of finished and unfinished pieces of earthenware. At the hut entrance is sitting a woman, who, with a piece of stick, is giving a finish to a large pot, which has been built up of rolls of clay, and is still unburnt.

[126] In figs. 218—225 I have reproduced some typical Chiriguano clay vessels that I collected at Aguayenda. These vessels are particularly well made. The peculiar rim warts seen on the hanging vessel in fig. 225,

342

[P 216 is blank]

323 counterparts of which are found on many ancient Peruvian clay vessels, have been more fully described by me in »En förgängen värld«.[1] The cord by which this vessel was suspended passed round the edge, and then upwards, between the points of the rim warts. At each wart a hole has been pierced through the rim of the vessel, but these perforations are so very small that they cannot very well have been used for fixing any string by which to hang up the vessel.

Besides the clay pots here reproduced — often graceful of shape and beautifully painted — there are also plain, unpainted clay vessels for cooking and other kitchen purposes. Chiriguano ceramics are of an exceedingly great variety as to form, and many of the shapes are identical with those of clay vessels found in ancient Indian graves and in the ground of ancient dwelling-sites in those regions of the Andes that border on the present Chiriguano country.

824 415 Next to clay vessels, bottles and bowls made of calabash may be said to predominate among the household furniture of the Chiriguano. The bowls are often provided with pokerwork ornament (fig. 226).

273 On festivals — and also usually, though not always — the Chiriguano drink an intoxicating liquor (»chicha«, in Chiriguano: »cangui«), which they prepare from maize. In [415] huge wooden mortars the maize is [531] pounded to flour, which is poured into large clay vessels filled with → water. This mixture is made to boil, and when it has cooled down, lumps of chewed maize dough are put into it to produce fermentation. These masticated mouthfuls of maize are usually allowed to dry in the sun, before use, and are then frequently spread on a [114] bedstead (fig. 190). This method of preparing maize beer naturally

[114] strikes one as particularly disgusting, and therefore, after I had got to know how the brew was made, I could never again bring myself to drink this beverage, which in itself is rather palatable. As I have already mentioned, an intoxicating liquor is also made from the fruit of the algarrobo tree. The beer made by the Chiriguano is very highly prized by
276 them. But, on the other hand, it does not appear that tobacco is used

by them to any considerable extent; I myself never saw any Chiriguano smoking.

The Chiriguano are very fond of music and dancing. Their musical instruments consist of a kind of primitive trumpets of cow-horn, reed flutes, whistles and drums.

An interesting Chiriguano whistling pipe is here reproduced, in fig. 117. It consists of a flat piece of some hard and heavy wood; is 18.5 cm long, 3.6 cm wide, and has a section as set out in the figure. It has, pierced through its longitudinal axis, a tubular perforation, 7 to 9 mm in diameter, and open at both ends, running from end to end of the instrument. In the centre of its upper edge there are two, somewhat smaller, holes through which is threaded the string which allows of the pipe being worn round the neck as a breast ornament. The carrying cord running through two holes, side by side, probably indicates that the pipe was meant to hang horizontally on the breast. If there had been only one hole for the cord, the pipe would have tilted one way or the other, like the beam of a pair of scales. The pipe is designed for blowing on in the

534 same way as Pan pipes, and naturally *gives out tones, when one end of the tube is closed, different to those producible with both ends open.* The pipe is open at both ends, therefore, not only because this allows the instrument to be easily cleaned from dust, dirt and saliva, but also because *this construction gives the possibility of a greater number of tones.*

539 171 That the Indians occasionally also give a thought to keeping dust, etc., from getting into their whistling pipes, is, besides, evident from the pipe shown in fig. 228, which is an Araucan whistle from Cautín, Chile, a tubular piece of wood, 27.5 cm long. A common brass thimble is fitted over the lower end of the pipe, and for its top end there is a small, well made stopper of woollen-yarn, connected to the pipe with a string, so as not to get lost when taken out for the whistle to be blown. Concerning this stopper, Eric Boman, who has reproduced the pipe in one of his works, writes as follows: »Este tapón sirve para cerrar la boca del silbato, cuando éste no se usa, e impedir que entren allí tierra y otras impurezas.«[1] »This stopper serves to keep the mouth of the whistle closed when the latter is not being used, and prevents dust and other dirt from entering.«

Fig. 228. Whistle. Chief of Cautín Chile. From Boman.

Objects of tubular form, in construction corresponding to the one here reproduced in fig. 227, have been found in ancient Peruvian graves, and not only the Chiriguano, but also many other tribes now inhabiting areas in the neighbourhood of what once was the Inca domain, are still

[1] Boman II, p. 508.

534
171

using whistles of this type.[1] Nordenskiöld has advanced a theory as to the origin of the Serére whistle, which is highly interesting. On the ground of the similarity of construction that this type of whistle has to a balance beam shown in fig. 229, with its cords for weights and load still in preservation, found in Peru, Nordenskiöld is of the opinion that the Serére whistle is probably the beam of a balance, but that its original use has been forgotten.[2] By blowing, in play, into one end of such a balance beam, a tone was produced. This way of whistle-blowing gradually became widespread and popular, and, eventually, whistles were manufactured that were of a construction similar to that of the balance beams of the ancients. More and more the balances ceased to be used as such, and finally it was altogether forgotten that the whistle had been made as a copy of the balance beam.

534
171
174
114

Fig. 229. Scale, with a wooden beam. Probably an imperfection from a whistle of Serére type, which forms the bar of the balance. Ground find from Peru. ½. Illustration from E. Nordenskiöld.

On my first acquaintance with this theory of the Serére whistle having originated from the balance beam, it seemed to me so well grounded that I accepted it.[3] But afterwards I quite changed my opinion in this question, for reasons set out below. The ancient Peruvian balance referred to by Nordenskiöld is undoubtedly of a very unpractical construction. Like the Serére whistle, the balance beam is *bored through from end to end*, and provided with *two holes, close together, for its suspension*. Even if in rough and primitive weighing there may occasionally be a certain advantage (a saving of time) in using a balance that is not too sensitive, suspending a balance from two

174
114

points of support, in the way shown in fig. 229, is unsuitable, as it would enable the holder of the balance to influence, with an imperceptible movement of his hand, the balancing of the beam. Another point which strikes me as peculiar, is, that the string by which weights and objects for weighing are suspended, should be made to pass through a hole that runs the whole length of the longitudinal axis of the beam. A perforation of such a length obviously represents a good deal of labour, which, moreover, in the case of a balance beam, would be quite unnecessary. Surely the simpler plan would have been to fix a string through a small hole at each end of the beam.

Fig. 230. Ancient Peruvian wooden whistle(?). ¼. From Nordenskiöld. One end of the tube has been stopped up, possibly an weight of the whistle having been found too heavy. Other whistles with both ends open. All other known Old Peruvian objects of this type have both ends open.

The above were my reasons for beginning to form the opinion that the Old Peruvian balance, fig. 229, had been rigged up to do duty as a *whistle*. A proper balance not being at hand, a tubular whistle, fig. 230, was pressed into service. In this way the ancient Peruvian balance, fig. 229, would — if my theory is correct — simply prove to be *a whistle that had been provisionally fixed up as a weighing instrument.*

Fig. 231. Old Peruvian scale. From Stern.

It is not impossible that this way of hastily improvising a balance — rather a dull one, admittedly, but usable for *rough weighing* — was not infrequently employed. When I acquainted Nordenskiöld with my theory as to the constructional purpose of the balance reproduced in fig. 229, he had the great kindness to send me all reproductions of Old Peruvian balances that were in his possession. Three of these retain the cord by which the beam was suspended (the pointing cord), and *in these three, this cord is fixed through a hole in the centre of the beam*, fig. 231. Two of the balances are provided with cords on which to hang the weights and the objects to be weighed. *These cords are not taken through the full length of the balance beam, but attached to it by means of holes bored*

in each of the lower corners of the beam ends, fig. 131. From the illustrations representing the rest of the Old Peruvian balances it cannot be seen in what way the pining and weight cords were fixed. The balances in question have, however, been published in Hamy's grand work, Galerie américaine, and from that work I have therefore endeavoured to gain information concerning this matter. There is only one balance, one without weight cords, that has been given a detailed description, and regarding this, it is stated that the beam, at its centre, has *a vertical perforation* (for the pining cord), and that the lower corners of the beam ends are each pierced with a slanting hole («les angles inférieurs sont aussi percés mais obliquement»).[1] If one or more of the balances reproduced had been of a different construction in this detail, the fact would no doubt have been noted in the text.[2] From what I have adduced above, it therefore follows that the illustrative material, which Nordenskiöld so chivalrously submitted for my criticism of his theory, most essentially enhances the probability of my opinion that the unhandy Old Peruvian weighing apparatus shown in fig. 129, is an improvisation of a whistle which, as I aimed at proving in a separate monograph, belongs to a type of open whistles which is widely distributed over the American continent.[3]

As mentioned, the Chiriguano live in villages, and it is only exceptionally that one comes across isolated huts. Each village is under the authority of a headman, or chief.

Both sexes marry at an early age. Monogamy is the rule, but well-to-do men, and chiefs, may be found who have several wives. When a girl menstruates for the first time, her hair is cut short (fig. 194), and she is kept shut up in a hut until her hair has grown long again, after which she is considered marriageable. When a boy attains to puberty, a hole is made through his lower lip, and a wooden plug is put into the hole. Subsequently this is exchanged for a bead-studded «tembeta» (figs. 194 and 197). Marriages are celebrated by feasting, when large quantities of maize beer are consumed. The women pass through childbirth easily, and therefore do not require many days of nursing after the child has

[1] Hamy (1), p. 110.

[2] In the British Museum there is an ancient Peruvian scale apparently of the same construction as those described by Hamy (note (1) p. 130, fig. 11).

846 [844] come into the world. But, in observance of a custom largely prevalent among the Indians of South America, the husband pretends for several days to be lying in childbed, and then keeps an invalid diet!

755 756 Illnesses are treated by medicine men, who by incantations and other resorts of magic try to expel the evil.

764 763 After a death, the corpse is placed in a large earthenware jar, which is put into a hole dug in the ground. According to what a Spanish-speaking Chiriguano Indian told me, it was formerly customary to sever, by incision, the spine of a dying person, in order to shorten his death agony. Before life was extinct, the body was thrust into a huge jar, into which also ornaments, weapons, food and drink were put, the mouth of the vessel then being carefully closed up with an earthenware platter. It was important that the lid was put on before the dying person had drawn his last breath. By doing this, it was thought that the soul of the dead [775] would for a time be held in confinement, so that it would not be able to work any harm on the living.[1] The jar was afterwards interred inside the dead person's hut.

181 With the exception of the Chaco — a tribe on the same cultural level as the Chiriguano — the latter seem to me a people considerably superior to the neighbouring tribes, whether inhabiting the mountain regions or the Gran Chaco. Both the mountain- and the Chaco Indians are dirty and of unclean habits, whilst the Chiriguano on the contrary [515] are very observant of bodily cleanliness. For example, the Chiriguano women bathe every day, and often several times a day. Among the [934] Chorotí, the girls are in the habit of living in loose sexual relations with a plurality of men, before marrying, whilst the Chiriguano girls, as a [171] rule, preserve their chastity intact until they marry. Also as regards material culture, the Chiriguano and the Chaco are on a higher plane than their present-day neighbours. When compared with the ceramics of the [323] peoples of the Chaco, the maize-beer vessels, for instance, that are characteristic of the Chiriguano and the Chaco, stand out as veritable show pieces.

181 648 Of old, the Chiriguano have a reputation for being a very warlike nation. As early as in the time of the Incas, this tribe made a raid into ancient Peruvian territory,[2] and even as late as 1890 the Chiriguano

[1] Cf. Kirchhoff (1), p. 130.
[2] Nordenskiöld (16).

gave regular battle to the whites. This battle, in which about 5,000 Chiriguano Indians took part, was fought at Curuyqui, on the tableland of Beyuovis. The result of the struggle was long undecided, but the Indians were at length compelled to give way before the superior weapons of the whites. 181 648

According to a Chiriguano legend, man's soul, some time after corporeal death, comes to the abode of the great spirit Tumpá, where it enjoys to the full everything in which it delighted during its earthly existence. But no joy is permanent. When the soul has spent its allotted time with Tumpá, it is obliged to return to the world and there enter into the body of a fox. When the fox dies, the soul moves into a rat, and, when this animal dies, into a branch of an old tree in the forest. The tree ages, withers away and dies and, as the branch decays, the soul, too, gradually perishes. When the branch has finally become mould, the flame of the soul is extinguished for ever. 775

/1/ Introduction

C 114 Knowing only the native tribes of Mato Grosso (Brazil) personally through my previous scientific travels, I accepted with much pleasure the proposal of the Sociedad Cientifica del Paraguay to visit the Indians of the Paraguayan Chaco, and as the idea was fully supported by the Comando del Chaco, I render thanks to the Sociedad Cientifico del Paraguay for its support, to the Jefe of the Comando del Chaco Paraguayo, the section leaders, and all the others who co-operated in my ex-
CSB pedition. I particularly thank His Most Reverend Excellency, the Archbishop of Asunción, Don Juan Sinforiano Bogarin, for the presentations which he made in my behalf before the Oblates of Immaculate Mary, whose mission is located close to the fort Esteros near the Pilcomayo River.

C I set out from Asunción on August 7, 1935, and, passing
Cc the fort López de Filippis (Paraguayan Chaco), on August 15 I
114 arrived at the fort of Toledo, where I found a great number of
Cc Izozó Indians, who had left their homes in the Parapití Valley
[131] because they had been provisionally relocated to the area of Toledo and of the fort "15 de Agosto" /15th of August/.

Cc In addition to my ethnological studies and preparations
114 for the coming journey, I attended to the commission of the
122 Paraguayan Red Cross to deliver clothing, goods, and wool
648 among the Izozó Indians, who at the time were in great need.
C Provided by the Chaco Command at the fort of López de
114 Filippis with two trucks, drivers and helpers, and the necessary provisions, I continued my journey on August 26, heading toward the Pilcomayo River. Beyond Corrales we met the first
C Indians: they were the Churupí /Chulupi/. In Moreno too,
A which we reached in the afternoon, almost at nightfall, there
114 were some Churupí who had moved from Muños to this place.
[361] On August 27 I arrived at the mission of the Oblates of
C Immaculate Mary near the fort of Esteros, where these fathers
114 received me in the most friendly manner and provided their
A most extensive assistance to my studies of the Churupí Indians
114 who were domiciled in or near the mission. They gave me a
797 large ethnological collection of objects of the Churupí Indians,
A which they presented to the Museo de Historia y Etnographia of
[126] The Sociedad Cientifica del Paraguay.

Ashluslay SK5
Mataco SI7
Chorotí SK6
Tapiete SK13

/1 cont./

000 the Sociedad Cientifica del Paraguay. Having also visited
C the Churupí Indians at the mission near Lake Escalante, about
A 25 kilometers from the mission at Esteros, I continued my
M journey on September 5 as far as Linares, where I found a num-
114 ber of Mataco Indians, who in part lived in a town some seven
M kilometers from Linares and in part had come from the other
[361] side of the Pilcomayo River to Linares.

/2/ On September 9 I left Linares and on the next day
C arrived in Guachalla, from where I visited the Churupí camp
A /tolderia/ about seven kilometers away.
114
[361]

On September 11 I left Guachalla for the fort of Cururenda,
C where I had the occasion to see the Chorote /Choroti/ Indians,
CI who were living in a camp some three kilometers from
114 Cururenda, as well as some Toba and Mataco, who came
CI from the other side of the Pilcomayo to Cururenda.
[361]

On September 15 I continued my journey as far as Oruro,
C in the environs of which I visited the Tapieté. My escort,
114 Lieutenant Cabello, who knew these Indians well, took me to
T their two camps, one of which is 15 and the other 32 kilo-
[361] meters from Oruro.

On September 19 I left Oruro, and passing through
C Capirendá and Carandayty, in the company of Lieutenant
114 Díego Corvalan, I arrived at Machareti, where I remained
from September 21-25. Since Machareti is a Chiriguano
town, I had a good chance at this place and at the end of my
journey, to observe this interesting Indian tribe.

Beginning my return on September 25, I passed in succes-
sion through Capirendá, Carandayty, López de Filippis, and
Puerto Casado, arriving in Asunción on October 8.

C Thanks to the great help of the military authorities, it was
[122] possible for me to pass through large areas of the Paraguayan
Chaco during the relatively short time of two months, to get
acquainted with a large number of native tribes of the Chaco,
to take photographs of these tribes, and to make up vocabularies
000 of their different languages. Outside of the Toba, whom I met

C 114 /2 cont./ outside of the Toba, whom I met only in passing. I got to know on this journey the Chiriguano and the Izozó, who, like the former, speak a dialect of the Guaraní language; the Tapieté, Churupí, Mataco, and Chorote. All of these Indian tribes are not unknown in ethnological literature. On Chiriguano history we are oriented through old documents from even the first years of the Spanish conquest, and we owe to the Franciscan missionaries, who have taught among them for a long time, quite important ethnological publications. The Churupí have been studied minutely under the name Ashluslay by Erland Nordenskiöld, and the Oblates of Immaculate Mary in Esteros and Lake Escalante are striving intensively to make ethnological investigations. I have proposed to deal with all of these tribes systematically. This survey will be made on the basis of the results of my journey, and I begin in this first publication with the Chiriguano and Izozó.

C CC [197] C 175 114 797 A 114 101 C 121

General Information

CC 114 361

As I said in the introduction to this work, I first met the Chiriguano in Machareti and the Izozó in the area around the fort of Toledo and in the fort "15 de Agosto," several kilometers from the former two.

C 361 [632] [797]

Figure 1 presents a view of Machareti, a Chiriguano town created in its present form by the Franciscan mission. When the Paraguayan army retook Machareti, it had already been abandoned by the Padres, and now a Chiriguano, in the role of commissioner /comisario/, is the chief of the town, there also being a few caciques. The houses, more or less in the form of modern ranchos (cf. Figs. 14 and 15 /see p.40 /), are on both sides of wide streets which run parallel and at right angles, as in most of the towns of the former Spanish colonies. When I was present in Machareti, there was great need /3/ among these Indians because of the severe drought which had ruined their plantings, which were some distance from the town. At the side of the ranchos are often found deposits which were structures of native houses built on sticks. Although

C [342] [363] C [731] C [342] 000

[See P. 8 -- Analyst]

C /3 cont./ Although
799 many primordial customs of the Chiriguano have been lost
177 because of the influence of the missions, there have never-
178 theless been preserved a sufficient number of native objects
126 to make a relatively complete ethnological collection among these Indians.

Ce The Izozó, having abandoned their homes in the regions
648 of the lower Parapití River during the Chaco War, had been
167 provisionally moved to the environs of the fort of Toledo and
361 the fort "15 de Agosto," where they were living in ranchos abandoned by the soldiers. In the environs of the forts they
Ce had scratched out large fields for their plantings, but, be-
241 cause of the great drought, they had had no chance to plant,
311 with the result that part of them had already returned to the
731 western region when I was in these forts. When I began my
167 return from Machareti, a large part of them were near the fort
[361] of Carandayty. According to the data kindly given me by the
Ce Toledo military authorities, the number of Izozó who had
162 come to Toledo and "15 de Agosto" up to June 30, 1935, reached 1,647 adults, 724 minors, and 122 small children, a total of 2,493 souls. On August 24, the end of my stay in Toledo, there were in this fort and in "15 de Agosto" only 503 adults, 141 minors, and 26 small children, most of them having returned to the west by this time.

Ce These Izozó Indians, who speak a dialect of the Guaraní
101 language, indignantly reject the name Chiriguano. They say
[199] that they are Guaraní and Paraguayans and that their name is
Ce Izozó. Up to now I have not seen this name in ethnological
101 literature and it does not appear in Moreno's work, Cuestión
114 de Límites con Bolivia /Question of Boundaries with Bolivia/, Vol. II. Only on the map of Bolivia drawn by the enginerr Franz Germann (Hamburg, 1904) is there noted between the Rio Grande and the Rio Parapití the name "Izozeños." The
Ce Izozó near Toledo told me that their homes were in the region
101 of the estuaries of the lower Parapití. Since these Indians re-
[361] jected not only the name Chiriguano but also the name Chané

/3 cont./

Ce 101 or Tapyi /Tapii/, it was not possible from what they said to ascertain with which of the tribes known to ethnology they C [101] can be identified. The Chiriguano call themselves "Mbya." If the Izozó were a part of them, they would have called them- Ce 101 17 selves by this name. No doubt they are Chané and that part of the latter which once had their homes in the Izozó River region, taking the name of this river for their own. Their culture, as demonstrated by the objects I collected among them, confirms this opinion. There are some differences between the objects collected among the Izozó and the Chiriguano in Machareti, either with regard to the decorations of the baked clay vessels or with regard to the making of the nets. But in principle it is not possible to decide whether these differences C 171 172 128 648 might not be only local differences. In general the culture of the Chiriguano was diffused in this way throughout the tribes successively subjugated by them, which is why it is proper to deal below with the aspects of the culture of the Chiriguano of Machareti together with that of the Izozó.

C Ce 101 17

Influences on the Culture of the Chiriguano and Izozó, Taken from Historical Data

C Ce [197] At the present time the Chiriguano and Chané form a cultural entity which can be designated as the culture of the Chiriguano, because the Guaraní language of the Chiriguano came to be the common language of the whole group. The Izozó also belong to this ethnic entity. Thus it is necessary to consider this entity /4/ as being formed of completely different tribes. It is also necessary to conceive of their culture as the product of the fusion of very heterogeneous cultural elements. Nordenskiöld deals with this question in one of his books (1)

Ce [113]

different categories depending on whether they received them from the whites, from the culture of the ancient Peruvians, or from the Mataco, Toba, and other tribes of the Chaco, or have them in common with the tribes of the north and the east related to them, as well as those that they brought with them from their primordial homes between the Paraná River and the Paraguay River. In what follows we shall often run into this matter, and inasmuch as these cultural influences have taken place in historical times and we know the history of the Chiriguano through existing documents dating from the first days of the Spanish conquest, I would like to make a resumé of these historical data in what follows, insofar as they have influenced the cultural development of the Chiriguano and Chané.

In one of my previous publications which appeared in this journal, entitled "Los Guarayú," I ran into the point at issue, to wit: whether the first Guaraní immigration into the western regions of the Paraguayan Chaco took place before the expedition of the Portuguese Alejo García to Peru or whether it took place after that time. In that paper I then deduced that it can be supposed that before Alejo García's expedition there were no Guaraní in the western regions of the Paraguayan Chaco, because no author mentions that García, who was accompanied by many Guaraní, had met other Guaraní in those regions. With this opinion that the Guaraní immigration to the west occurred after García's expedition, which is based principally on indications by Guzmán, the opinions of Manuel Domínguez and Erland Nordenskiöld also agree. This question of the Guaraní invasion into the western part of the Paraguayan Chaco is also dealt with in detail by Fulgencio R. Moreno in his work Cuestión de límites con Bolivia (3). In that place (4) there

is reproduced a document which, I believe, serves to clear up this much discussed point. This is the report that Father Alcaya, Curate of Mataca, wrote for the Viceroy of Peru, the Marquis of Montes Claros. This report says that the Inca in Peru, before the Spaniards came to Paraguay, commissioned one of his descendants named Guacane to conquer the llanos of Grigota. Guacane's project was quite successful, especially because he had been well received by the great cacique Grigota, who reigned over this province. With the aid of his brother Condori, who was sent after him and to whom was entrusted the exploitation of the mines of Aypurun, he obtained a great deal of gold and silver in the country. The natives respected him and he employed them in tilling maize fields and helped them in hunting. Through the Indians of the llanos rumors of the wealth of the brothers, Guacane and Condori, reached the ears of the Guaraní in Paraguay, who recruited a force of 8,000 Indians and came in three divisions with their women and children, westward from the Xaraye. Of the 8,000 Guaraní, 1,000 remained in the province of Itatim; 2,000 marched against the Inca Mango and were destroyed until they were reduced to a few by the Peruvians. The largest division, 5,000 Indians, first marched to the region of Santa Cruz de la Sierra, and there they subjugated the humble and unwarlike people of that region. /Plates I-II appear here./ /5/ They remained

648 there for one winter, sending out their spies to the Llanos of
726 Grigota, where King Guacane was resting without care with his men. Unexpectedly one night the Guaraní surprised the King and his men, more than 20,000 Indians, and killed many, among them King Guacane. Grigota, the previous ruler of this country, was seriously wounded. From there the Guaraní victors set out toward the cordillera where Condori, the dead king's brother, was exploring the mines. Leaving their women and children at the foot of the cordillera with a guard, they climbed the mountain and on the following night killed the miners and captured Capitan Condori. The Guaraní then found the fortresses of Guanacopampa and Savaypatta abandoned by their
[727] garrisons. In Savaypatta they found only the women of the Incas, whom they took with them as prisoners. They also found a great deal of gold on Aypurun Mountain. After these successes the Guaraní established themselves in the cordillera, where they also remained in the following period. The Guaraní won another victory over the Peruvians when they overcame Capitán Lucana, whom the Inca had charged with rebuilding the fortification of Cerro de Aypurun. The Guaraní came out to meet the Peruvians and, at a short distance, smashed them and killed more than 6,000 of them. But after that their triumphal march against the Peruvians came to an end. Retiring to their headquarters on the Cordillera, the Indians gathered together by Grigota prepared a surprise for them which had complete success. Five hundred Guaraní were killed and 200 fell prisoner and were taken to Cuzco, where they were condemned by the Inca to suffer death by cold on the snow-capped peaks of the Andes.

174 Father Alcaya's report [illegible] much interest because it pro-
175 vides us with two importan[illegible]tes about the first immigration
167 of the Guaraní. The report tells us about the death of King
648 Guacane. According to Alvar Núñez, this king was still alive when Alejo García returned from his expedition to Peru (5).

M4 M5 167 645

It thus follows that the battles between the Peruvians and the Guaraní described in Father Alcaya's report and the settling of the Guaraní on the cordillera must have taken place after García's expedition. An even more certain clue is given us by a passage in the report which mentions the name "Mango Inga" (6). The following is said there: The Xaraye "gave them

6. Moreno II, p. 86.

more definite news of the señores and showed them silver clasps and small silver rings for their bows, which King Guacane had sent them from Grigota, scarcely 100 leagues away, and similarly gave them certain news of Mango Inga, who was not resting after his new conquest toward the north and the east, but was hastening to put into effect and overrun the land with his good government." Mango Inga was the legitimate successor of the Inca Huascar, who had been killed by his brother Atahualpa, whom Pizarro, at his request, had helped to realize his claims to the throne and with whom he entered the Inca capital on November 15, 1533. This Inca Manco died after his variable battles with the Spaniards in the year 1544. According to this, the battles between the Peruvians and the Guaraní and the first settlement of the Guaraní on the crests of the cordillera in the west of the Paraguayan Chaco, which was contemporaneous with those battles, must have occurred between 1533 and 1544, and probably at the beginning of this period of time, because the last years of Inca Manco's life were much taken up with his battles against the Spaniards. According to Dr. Manuel Domínguez' opinion (7), García's expedition took

[113]

7. Dr. Manuel Domínguez: "Paraguay-Bolivia. Cuestión de limites." Lectures. Asunción, 1927, p. 11. Cf. Moreno II, p. 84.

place between 1524 and 1526. This is very much in accord with the fact that the Guaraní, who through García's expedition had learned of the riches of Perú, and beyond that had received reports of the riches of the country belonging to the brothers /6/ Guacane and Condori through the Indians of the llanos, determined about ten years later to emigrate in large numbers, accompanied by their women and children, to this rich land. We must then fix the first settlement of the Guaraní in the regions in the west of the Paraguayan Chaco as having taken

/6 cont./

174
175
167
648

place after García's expedition. But it is possible that in the interval, and perhaps also before García's expedition, the Guaraní might have made smaller forays to the western regions "to the land within," as is said in the report of Alvar Núñez Cabeza de Vaca. Doubtless it is one of these forays that is dealt with in the description given to Alvar Núñez by a Guaraní who had lived among the Charayes. The Indians of his generation, that is, the Guaraní of Itatí, "sent out a great call and held a gathering of Indians of the whole land, and they went to the land and the settlement of the land within." They made war upon the Indians of this land and took from them the sheets and jewels that they had of gold and silver, despoiled many towns, and killed many Indians. But afterward their adversaries joined together, attacked them in great number, and killed nearly all of them. The rest fled into the mountains (8). On the sixth day after his departure

[113]

8. Moreno II, p. 86. Alvar Núñez Cabeza de Vaca, Comentarios historicos, N. 35, pp. 100, 102, and 103.

from Xarayes, Alvar Núñez met some of those Indians who had fled to the desert after their defeat. Some of them, whose age Alvar Núñez calculated to be 35, stated that they were unable to give any information about the route which the Guaraní had then followed in their foray, because they had been very young at the time. Following this information, we must suppose that this unsuccessful foray on the part of the Guaraní to the west must have taken place in the year 1543. Between the expedition of Alvar Núñez and that of the Portuguese Alejo García, which, according to Dr. M. Domínguez, took place between 1524 and 1526, there is a period of about 20 years, and Alvar Núñez could only guess at the age of those Indians who said that they had still been very young at the time of the said foray. Thus this foray might have taken place, according to what is ascertained from the clues based on the age of those

Gi /6 cont./
174 Indians, either before or after García's expedition. But in any
175 case, this foray with which we are dealing is not that great
167 Guaraní expedition against Guacane and his brother Condori,
648 since it is related in the document cited that these Guaraní,
c after their victorious battles against Guacane and Condori, had
[101] settled on top of the Sierra, where they also remained after
their defeat by Grigota, henceforth being called by the
Peruvians by the name Chiriguano. The Guaraní who made the
foray to which Alvar Núñez refers were almost all wiped out
by their enemies, who were probably Chaco Indians, and only
a few survivors escaped, taking refuge in the desert through
which they had previously passed.

Ce In Puerto de los Reyes, Irala received from a Chané cacique
[173] who spoke Guaraní the information "that in times past, before
[648] García had come from Brazil to the said Guaraní, a great
gathering of the said Guaraní was held in the port that they call
Itatin in order to go to search for metal" (9). On this occasion

9. Moreno II, p. 91.

the Guaraní passed through the lands of the Chané and
destroyed their houses. Also in this statement of the Chané
cacique nothing is said about a permanent settlement of the
Guaraní in the west. Rather it says that the Guaraní wanted
to "search for" metal. Thus we are also dealing here with a
Guaraní foray.

Gi The Guaraní expeditions and emigrations described above
175 were from the beginning connected with hostile contacts with
648 the various native groups of the lands through which they
Gi passed. In all the regions where the Guaraní met other Indians,
[567] they devastated their camps /toldería/ /7/ and carried off
[727] with them as slaves all the inhabitants who had not been
killed in the fighting. They were the enemies of all and
Ce were hated by all. The Chané in particular, described as
[648] peaceful and unwarlike, suffered their acts of violence. When
[181] the Guaraní who had emigrated to the west after their defeat
C by Grigota had settled permanently on the cordillera, they

continued defeating the neighboring Indians and especially those of the llanos, and they took off with them many of these as slaves to serve them as auxiliaries in other forays. When Nuflo de Chaves came to the cordillera, the Chiriguano were coming to make war upon the Indians of Poxo or of Misque, but Nuflo de Chaves upset their arrival and made them break off their hostilities with those Indians and the others of the frontier. (10) In 1560 the violent actions of the Chiriguano

10. Moreno II, p. 77.

against the tribes in their vicinity forced the viceroy of Peru to send Captain Andrés Manso to that region in order to found a town there, thus establishing a defense against the incursions of these Indians (11). The report of the Corregidor of Tomina,

11. Moreno II, p. 261.

Don Juan Arce Alvendin, made in 1618, informs us that the Chiriguano at first lived in peace with Andrés Manso, but later counseled the Chané who had been pacified by Manso to rebel against the Spaniards, and they killed Captain Manso and the rest of the Spaniards of the new town. They took over the land, subjecting the Chané and making them serve as slaves. In the statement of Sebastian Perez Chamoso in 1571 (12), the

12. Moreno II, pp. 106-107.

act of violence of the Chiriguano against the Yanacona and Chicha Indians are mentioned, and it is said that they took Chicha Indians as slaves. In the Decree of the Royal Audiencia in which it was resolved that war was to be waged against the Chiriguano in the year 1583, there is mentioned among many other misdeeds of the Chiriguano the fact that they had also usurped and devastated the lands of the Llanos and the Chané Indians (13). By continually enslaving the Indians of the

[727]

/7 cont./ By continually enslaving the Indians of the subjugated tribes, the Chiriguano by the end of the 16th century already had numerous subjects and auxiliaries in their wars. Most of the Tamacocies (later called Chamacoco) and the Chané were among these, and if other documents of 1583 and 1584 relate that the Tamacocies, the Xores, the Mares, and the Yuracares were their allies, it is probable that this was a case of such Indians violently subjugated and used as auxiliaries in war (14). While the Tamacocies (Chamacoco)

Gi

14. Moreno II, pp. 72 and 73.

were subsequently emancipated from their Chiriguano conquerors and emigrated to the east, most of the Chané, who formerly were a very populous nation, remained in subjugation for a long time (15). Because of the poor treatment that the

15. Moreno II, p. 249.

Chiriguano normally accorded them, there was always a contrast between the two nations, and the Chané preferred to be dependent on the Spaniards rather than remain in slavery to the hated Chiriguano (16). According to Corregidor Tomina's report

Ee
Gi
175
648
162
567

16. Moreno II, p. 250.

in 1618, already mentioned in what has been written above, the relationship between the Chiriguano population and the Chané population was such that the number of pure Chiriguano was smaller than the number of their subjects. According to the estimate made in this connection, the population of the Chiriguano of the Cordillera consisted of 1,500 pure Chiriguano, among whom were distributed 10,000 Chané. Among the 400 Chiriguano of the province of Machareti were distributed 5,000 Chané slaves. Yet for several centuries the Chané must have remained in harsh slavery to the Chiriguano until, in the second half of the 19th century, the formidable resistance of the Chiriguano was broken, and, after a severe blow,

themselves from the oppression of their old masters, forming their own separate towns in the midst of their former masters (18).

18. Father Alejandro Corrado in the year 1883. In Moreno II, p. 254.

In addition, the final insurrection of the Chiriguano in the year 1890 was put down by the Bolivians; and for that reason the situation of the Chané was not modified, and so it is that the explorer Erland v. Nordenskiöld found them still under the same conditions (19).

648

Having described above the history of Chiriguano relations with the ancient Peruvians and the other Indian tribes, we have yet to deal also with their relations with the whites, that is, with the Spaniards or Bolivians, who little by little occupied their territory. We must stress in the first place the fact that the first whites who came to their territory and to the adjacent llanos were not any novelty to them, since even before their emigration the Chiriguano had met these people in their native land between the upper Paraná River and the Paraguay. Because of the initial attitude of the Guaraní on meeting the conquistadors, it is evident that both parties had the same aim, that of getting rich from the wealth of the rich lands of the west, of which they had heard. In order to attain

C
Gi
175
648

/8 cont./

this common end, the Guaraní had first favored the conquistadors, giving them important information about the rich land and the ways to get there, and placing themselves at their disposal as auxiliaries in war. According to Guzman, the Portuguese Alejo García took with him 2,000 of these Guaraní from the Paraguay on his expedition to Peru, and if Guzman says that that expedition of García's was the cause of the subsequent expedition of the Guaraní to the west and of the emigration of a great number of them to the western regions of the Paraguayan Chaco, we ought not to reject this opinion, limiting it only in that sense that García's expedition might have been one of the causes of that emigration. When Nuflo de Chaves on his expedition later met the Guaraní of the cacique Vanbaguazu, they received him in a friendly way, oriented him with reference to the rich land and the routes there, and gave him companions for his trip (20).

20. Moreno II, p. 55.

The first of the conquistadors whom the Guaraní met after their emigration to the Cordillera, henceforth called the Chiriguano of the Cordillera, was Captain Domingo de Irala. According to Father Alcaya's report, when Irala arrived in these regions, he sent a Guaraní of his council to make overtures to the Chiriguano Indians, and in what follows the report says literally: "... and many of them came to offer him peace." But in spite of this peace, the Chiriguano did not wish to show him the gold mines and also kept Captain Condori, whom they had captured in their expedition against the Peruvians and whom they now turned over to Captain Irala, as an expert, from finding out anything about the mines (21).

21. Moreno II, p. 92.

Gi
C
125
648

/8 cont./

In 1560 the two conquistadors, Nuflo de Chaves and Andrés Manso, arrived in the Chiriguano region in the Vitupue Province (22). In Gabriel Paniagua de Loayza's letter

22. Moreno II, p. 264.

to the Royal Audiencia in 1584, we learn that the Chiriguano of the Sierra, when Nuflo de Chaves arrived for the first time in their land, were about to make war on the Indians of Poxo or of Misque. As has already been mentioned above, Nuflo de Chaves upset their plans and made them cease hostilities (23).

23. Moreno II, p. 77.

Through the division of territories that took place later between Nuflo de Chaves and Andrés Manso, the former received the /9/ northern territories and the latter the southern ones. While Nuflo de Chaves had to deal principally with the Guaraní Itatines, later called Itatines-Guarayú, who had emigrated into those regions located more to the north and who in a little while killed the valiant conquistador, it was from the beginning Andrés Manso's mission to arrange relationships with the Chiriguano of the Sierra and to put an end to their violent acts. At first Manso managed to enter into peaceful relations with most of the Chiriguano and to put them in service as vassals; but it seems that they were involved from the very beginning in the differences that existed between Nuflo de Chaves and Andrés Manso. A document of 1501, the "Testimonio del Escribano Francisco Gallego /Testimony of the Clerk Francisco Gallego/" (24), gives interesting comments

24. Moreno II, pp. 273 and 274.

upon this matter. He says that in 1560 a Chiriguano Indian came as a delegate of the cacique Bitupue and other caciques to Nuflo de Chaves to complain about Andrés Manso's conduct and at the same time to ask him what they should do. While

C
Gi
175
L48

/9 cont./ while
Nuño de Chaves, as has been mentioned, had prohibited the Chiriguano from continuing their acts of violence upon the other Indians, a short time later Manso made them join up to go to war against the Indians of the llanos. The Chiriguano, having learned of Captain Manso's intentions, all returned to their old ways. Manso again called them to go to war against the llanos Indians, and he took with him several Chiriguano caciques. When it seemed to him that they were taking him along a wrong path, he killed a Chiriguano Indian and ordered another one's hand cut off. He also killed a messenger of the cacique Botipue. We learn from this letter that the hostility which shortly thereafter broke out in the peaceful relations between the Chiriguano and Andrés Manso, and which cost considerable effort, expense, and sacrifice to the Spaniards and later to the Bolivians, was motivated, at least in great part, by the violent acts of the first whites who had relations with these Indians. This guilt of the Spaniards in the continual hostilities with the Chiriguano was frankly admitted by the Maestro General of the Province, Don Salvador Pasit, in the year 1778 (25).

25. Moreno II, p. 241.

He sent an order to all the soldiers that they suspend their activities against the Chiriguano, stating that the attitude of the Chiriguano was provoked by the introduction of the Spaniards into their lands, in which they had established estancias and herds. The beginning of the hostilities between the Spaniards and the Chiriguano was due to the latter, who suddenly attacked the town of Condorillo, or Santo Domingo de la Nueva Rioja, founded by Andrés Manso, and killed the latter, together with all the other Spaniards, and burned the town (26).

26. Moreno II, p. 281.

C
G1
175
678

/9 cont./

The same fate befell the town of Barranca founded by Nuño de Chaves and Captain Miguel Martin, and their men in the town of Lagunilla. Moreover, nine of Nuño de Chaves' men, as well as Captain Pedro de Castro, who had been charged with rebuilding the destroyed town of Santo Domingo de Nueva Rioja, were killed (27). The attacks and robberies of the Chiriguano

27. Moreno II. p. 114.

against the Spanish settlers were so frequent and continual at the end of the 16th century that they were in constant danger, and communications between the several larger towns were quite difficult (28). The various Chiriguano factions had

28. Moreno II. pp. 102-104, 106, and 107.

divided among themselves the land where they were to make the attacks (29). The expedition of the Viceroy Don Francisco

29. Moreno II. p. 120.

de Toledo, with many people and much equipment and at great expense, had no success whatsoever (30). The Chiriguano

30. Moreno II. p. 114.

continued robbing and attacking. From time to time occasional expeditions were sent to punish them, which, in passing, burned a few rancherias and maize fields /10/ and killed some of them (31), but they never had a decisive success, and this

31. Moreno II. pp. 116-118.

situation still continued for two centuries in an almost unchanging form.(32). But despite these hostilities, there were

32. Moreno II. p. 273.

some relations between the Chiriguano and the Spaniards from the earliest times. According to the Relación de la Annua de la Compañía de Jesús /Annual Report of the Company of Jesus/ for the year 1596, there had been obtained from Potosí and the Charcas many ways and means for bringing them toward peace, considering the very little hope of pacifying them by arms (33) and, according to the same report,

> 33. Moreno II, p. 107 /the first figure of this page number is missing in the original text and has been supplied here on the basis of a previous citation./

already at that time some Spaniards were going in and out of there to deal with them, and also the Chiriguano were coming both to Potosí and to the Charcas for the same purpose. In addition, Techo, who wrote his Historia de la Provincia del Paraguay in the second half of the 17th century, relates that the Chiriguano sold their prisoners of war to the Spaniards. "They lost no opportunity to devote themselves to this business; they compared with the Spaniards themselves" (34).

> 34. Moreno II, p. 257.

According to a communication from Escribano Mosquera in 1579 (35), there were already some Spaniards living among the

Chiriguano at that time. This gentleman had heard of two Spaniards and a mestizo among them, who were probably prisoners of war.

C
Gi
175
648
797

/10 cont./

At the end of the 18th century relations between the Chiriguano and the Spaniards modified to the point that from this time on the mission managed to propagate the faith somewhat more among the Chiriguano. In 1779 the Intendente of Cochabama, Don Tomás Leso, after a bitter struggle, defeated the Saypuru faction, which was the one most feared. Later the reduction of Florida was formed on the western shore of the Guapay, with some hundreds of families who had not assisted the Saypurú faction and so, fearing their vengeance, followed the Spaniards (36). Several years later a few other

36. Moreno II, p. 244.

missions were founded by the Franciscans, together with the fort at Saypurú, as a defense for the missions. But by 1799 the Chiriguano had attacked six of these missions, devastating them completely (37). A strong campaign against the

37. Moreno II, p. 245.

Chiriguano, directed by Intendente Viedma in person, had not had any success at all, the army of 2,000 men having turned back when their officers were killed by the enemy. In spite of this the missionaries repaired the destroyed reductions (38).

38. Moreno II, p. 246.

According to the notes of Father Antonio Comajuncosa (39),

39. Moreno II, pp. 246 and 247. A historical manifesto of what the missionaries of Tarija have wrought.

there already existed in the year 1810, 18 missions among the Chiriguano in the southern zone of the Pilcomayo River. Through the influence of the missions and through both violent

G1
C
175
648

/10 cont./ through the influence of the missions and through both violent and peaceful means of the Spaniards and, later, by the Bolivians, conterminous with the Chiriguano, little by little most of the Chiriguano came over to their side, so that the power of the Chiriguano tribe, in another time so strong and invincible, was weakened (40). Thus it happened that in

C
Gi
[113]

40. José Cardúz: Las Misiones Franciscanas entre los infieles de Bolivia /The Franciscan Missions among the Infidels of Bolivia/. Barcelona, 1886. From Moreno II, pp. 248 and 249.

1875 the inhabitants of the neighboring provinces were able to give a final blow to the last segments of independent Chiriguano, subjugating them completely and obliging the defeated factions who refused to submit to disperse into other lands, some of them taking refuge in the Chaco among the Toba and Tapieté (40) /see footnote 40 above/. Nevertheless, this was not the final fight between the Chiriguano and the whites, as Cardúz supposed in 1885. A part of the Chiriguano in 1890 attempted one last rebellion against the Bolivians. About 5,000 Indians gathered on the Boynove plain near Curuyuqui, fought for a whole day against the Bolivians, who were assisted by some thousand Indians of the same tribe. At nightfall the heated battle had not yet been decided, but in the /11/ night the Indians lost their spirit in the face of the superiority of modern arms and left their trenches (41). Also,

41. Nord. 1, p. 168.

after this defeat one of the caciques, named Cayahari, preferred to take flight rather than surrender to the Bolivians. They say that he settled in the area of a large lake far from the whites (42).

42. Nord. 1, p. 161.

/11 cont./

C. Gi 175 178 167 The preceding historical sketch has shown that we can ascertain the history of the Chiriguano by means of numerous documents over a period of 400 years, up to that epoch so important for their future fate and culture, during which they emigrated from their native country and settled in a distant region. In this new country they found completely different conditions of life. All three factors by which all human life and all human culture are influenced and conditioned, nature, social state, and the spiritual culture of the ambient, were different in the new surroundings, and for that reason during the four centuries of their history they had to modify their primordial culture, which they had brought from their native country.

C 178 [126] The products of their present-day culture, dealt with in this publication by means of the ethnographic collection that I brought from Machareti and Toledo, must be regarded as the result of numerous and different interacting factors. Some of the products of the old culture were kept in a fairly primordial form up to today; others were modified, either being perfected or in some cases degenerating. Many were completely lost because of the modified circumstances, and some were added as a result of the assimilation of outside cultures.

C. Gh 177 174 C [113] As we have already said, the question of the influences on Chiriguano culture has been extensively dealt with by Erland Nordenskiöld (43). While the Chiriguano received relatively

43. Nord. 2, pp. 195-213. Cf. Alfred Métraux: "Etudes sur la civilisation des indiens Chiriguano /Studies on the Culture of the Chiriguano Indians/," Revista del Instituto de Etnología de la Universidad Nacional de Tucumán. C
Gi
177
174

/11 cont./

little from the Indians of the Chaco, we must derive the most important modifications in their culture from the influences of the ancient Peruvian culture. Because of the short duration of the Inca Empire after the time of the immigration of the Chiriguano, we must suppose that these influences were less direct influences than indirect ones through the confluent peoples of the mountainous land of Peru and Bolivia, who had been in contact with the ancient Peruvians for a long time and many of whom had been subjugated by the Chiriguano and made to enter into their community as slaves or vassals. We know that the culture of the Chané, who made up the greater part of the Chiriguano population, had contact with the ancient culture of the Peruvians. In contrast with the influence of the ancient Peruvian culture, the influence of the whites had rather more negative and destructive effects than constructive ones on the primordial culture of the Chiriguano and the Chané, leaving many native industries superfluous because it was more convenient to replace their products with imported merchandise.

Ce
[177]

C
Ce
128

In the respective chapters that deal with the various developments of the culture of the Chiriguano and Chané, we shall expound the details of these cultural influences.

C 144 648 Ce 648 From the preceding historical sketch it can be seen that the ethnic entity "Chiriguano-Chané," with regard to its physical characteristics, is made up of an ethnic mixture of absolutely heterogeneous elements. We have told how the Chiriguano for centuries captured many prisoners, incorporating them into their community, and how at the end of the 16th century the number of Chané incorporated among them was much larger than that of the pure Guaraní-Chiriguano. Although the Chané, belonging to the linguistic group of the Aruacos /Arawak/, were a peaceful nation and were not equal in strength to the pure Chiriguano, their culture, which for a long time was in contact with that of the ancient Peruvians, was doubtless superior to that of their oppressors, and the Chané women surely had considerable influence on their masters. Since the two population elements lived together for three and a half centuries, we must suppose that they would have mixed extensively.

C 142 175 Unfortunately, the ancient documents say very little about the physical qualities of the Chiriguano. The only brief note on this subject that I know of is found in the "Descripción y población de las Indias" by Bishop Lizarraga (44): "They are

44. Moreno II, p. 101.

C [302] Ce 144 175 comely, robust, with broad-shouldered, high chests, well built, dark. They pluck their eyebrows and eyelashes; the eyes are small and lively." According to Father Alejandro Corrado in the year 1883, that is, a short time after the Chiriguano lost their independence because of the whites and the Chané began to become emancipated from their oppressors, forming their own towns, somatic differences between the

In addition to anthropological measurements made on four Chiriguano by Ten Kate (46), Robert Lehmann-Nitsche

46. Ten Kate, Herm.: "Matériaux pour servir à l'antropologie des indiens de la République Argentine /Materials for use for the anthropology of the Indians of the Argentine Republic/." Revista del Museo de la Plata. Vol. 12. La Plata. 1904.

in 1906 had the opportunity at the San Pedro de Jujui sugar mill to take the anthropological measurements of 40 Chiriguano men and ten women, who had come from Bolivia to work at that mill. Entitled "Estudios antropológicos sobre los Chiriguanos, /Pl. III-IV appear here/ /13/ Chorotes, Matacos, y Tobas (Chaco Occidental)" (47), Lehmann-Nitsche has

C
[113]

47. Anales del Museo de La Plata, Vol. I, No. 2, (Second Series). Buenos Aires, 1908.

published the results of these measurements, together with measurements of other Indians, and added to that publication in the first 12 plates Chiriguano types photographed by Carlos Bruch. In addition to the somatic measurements, determination of skin color, eye color, and hair color and form have been published by Lehmann-Nitsche. Thirty-six of the 40 Chiriguano men stated where they had lived, and from this we know that these people had come from various regions of Chiriguano territory to the San Pedro sugar mill. There were some who had come from the northern regions, and one had come from the city of Santa Cruz de la Sierra. Others had come from the south of Chiriguano territory, for example, from the town of Carapati, located considerably to the south of the Pilcomayo River. There are named 13 Chiriguano

166 towns from which one man had come from each one. From Charagua, Parapití, and Carapati two had come from each one, four from Ingre, five from Santa Rosa, and eight from Machareti. Unfortunately, the native soil of the Chiriguano women was not stated, and it is only said that they came from Bolivia.

141 The average height of the Chiriguano men measured by Lehmann-Nitsche is 163.4 cm., and the height of the Chiriguano women measured is 151.7 cm. This average height of the women measured is not a little less. The average height of the eight men from Machareti was only 161.8 cm., and that of the two men from Parapití only 158.1 cm. But the average height of the four men from Ingre was 169.15 cm. The tallest of the Chiriguano men measured, who had a height of 178.6 cm., had come from Ingre, and the shortest, with a height of 153.5 cm., from Machareti. The smallest woman (between 35 and 40 years old) was only 143.0 cm., and the tallest, 158.0 cm. These numbers show us that the height of different Chiriguano individuals is quite variable. Among the Chiriguano measured by Lehmann-Nitsche, the number of those who came from the same region is too small to be able to make exact deductions about the differences in height of the Chiriguano of the various regions in order to be able to clearly demonstrate the somatic influence of mixture with other tribes.

14 The photographs of Chiriguano types published by Lehmann-Nitsche show great variations among the different features and bodies, which corresponds to the fact that the present-day Chiriguano are the product of a mixture of various ethnic elements.

113 Good photographs of the Chiriguano of the southern part
114 of their territory can be found in the publication of von Rosen,

The Territory of the Chiriguano

C
131 Concerning the location and extent of the territory of the Chiriguano at the time of their independence, that is, from the beginning of the 16th century to the second half of the 19th century, we have Moreno's detailed studies in two places in his work already cited many times above, the titles of which are: "Las tierras de los Chiriguanos /The lands of
C [101] the Chiriguano/" (50). According to Moreno (51), the

50. Moreno II, pp. 79-126 and pp. 235-254.

51. Moreno II, p. 236.

Chiriguano--Chiriguano /14/ of the Cordillera in contrast to the Itatines-Guarayus and the Piritaguaris also often called Chiriguano in the literature -- from the time of the Conquest until they lost their independence inhabited the same territory, that is, the western spurs of the Andes from south of the Pilcomayo up to the lands which extend on both sides of the
Ce Guapay. The Chané, who formerly had a large well-populated
3 territory, "although they formed several partial migrations,
[648] remained in great number subject to the conquering Guaraní within the region which these latter had converted into their impregnable abode" (52). In 1883 Father Alejandro Corrado

52. Moreno II, p. 249.

/14 cont./

Ce 131 still writes that the Chané were found scattered among the Chiriguano located among the last spurs of the Andes (53).

53. Moreno II, p. 254.

C 131 [114] Even after losing their independence, the Chiriguano inhabited more or less the same territory. Having known personally only Machareti out of the territory of the Chiriguano, I here refer to the data of Erland Nordenskiöld, who came to know them in the years 1908, 1909, and 1913 and personally traveled through most of this territory, spending up to four to five months altogether in the study of the Chiriguano and the Chané (54).

54. Nord. 2, p. XII.

According to Nordenskiöld (55), the territory of the

55. Nord. 2, pp. XIV and XV. Cf. Métraux I, pp. 332 and 333.

Chiriguano extends from the region near Santa Cruz de la Sierra in the north to near the Bermejo River in the south. Now the Rio Grande can almost be taken as the northern limit of C Ce 131 their territory. This is the land located between the boundary of the Andes and the great plain of the Chaco, in the valleys of which the Chiriguano, and in part the Chané live. It can be said that this territory is inhabited wherever there is the necessary water, although it may be no more than enough for and their domestic animals to drink. The Chiriguano inhabit that territory contiguously, while the Chané today live in territories separated from one another. Thus some of them are on the Itiyuro River in Argentina, some are in Caipipendi, some on the lower Parapití River, and others near Itaú, south C 131 of the Pilcomayo River. Outside of the territory of the Chiriguano [167] which has thus been circumscribed, a few Chiriguano now live in the Santa Rosa Valley north of Santa Cruz de la Sierra, and a few fled to the Chaco after the last broken revolt in 1890, without our having any information on their stopping place.

/14 cont./

131 without our having any information on their stopping place.
[563] Some Chorote live in the territory of the Chiriguano, near
[797] Yacuiba, and also, without counting the missions, the whole territory has been penetrated by whites and mestizos.

131 According to these data given by Nordenskiöld, the
174 territory of the Chiriguano, after their definitive subjection by the whites and up to the present time, has remained the same as that which they had at the time of their independence, except, it would seem, that they have come down more into the valleys and do not now live, as was stated in the 16th century documents, on top of the inaccessible mountains, which, as natural fortresses, offered them a secure refuge during their expeditions.

Towns and Houses

361 The arrangement of the towns and the form of the houses
177 of the Chiriguano are not at the present time the primordial ones, and they have probably passed through two different transformations, one after the other, first under the influence of the architecture of Inca culture and later the architecture of the whites. /15/ According to the Annua de la Compañia de Jesús Tucumán and Peru, of the year 1596, the Chiriguano towns were composed of only a few houses that were large enough to house as many as 100 persons. In his "Descripción breve de toda la
361 tierra del Perú, Tucuman, Rio de la Plata y Chile /A Brief
342 Description of all the Land of Peru, Tucumán, Río de la Plata,
62 and Chile/," Father Lizarraga (56) describes the Chiriguano
[113]

56. Madrid, 1909. Nueva Biblioteca de Autores Españoles, Vol. 15. Cited in Nordenskiöld.

towns in the following way: "The largest of the towns is one of five houses: the common number is three; but they are very long, more than 150 paces, with a two-sloped roof with posts in the middle, upon which the framework is constructed, and one kin group /parentela/ lives between one post and the next one."

/15 cont./

500 next one." Garcilaso de la Vega (57) describes the large houses

342

57. Vol. II, p. 281. According to Métraux I, p. 331.

of the Chiriguano in the same way: they build a very large dormitory, and inside as many alcoves as there are residents, and so small that there is no room for anything but persons. Through detailed descriptions and sketches, we are familiar with the construction of the towns of the ancient Guaraní of the Tupinambas on the eastern coast of Brazil (58). Four or

361 342 171 712

[113]

58. According to De Bry. Métraux, A.: La civilisation matérielle des tribus Tupí-Guarani /The Material Culture of the Tupi-Guarani Tribes/. Paris, 1928.

five long, rectangular houses were built a short distance from one another around a quadrangular or pentagonal plaza, and the whole town was fortified by a defensive wall. We also know that the ancient towns of the Chiriguano had such defensive constructions through information from the year 1618, when Ruiz Diaz de Guzman found such a fortification of a Chiriguano town near the Pilcomayo River, which consisted of "two concentric walls of stone and of wood" (59). According

361 712

361 342 171

59. Moreno II, p. 252.

to Serrano (60), the Guaraní towns of the ancient Province of

[113]

60. Antonio Serrano: Etnografía de la antigua provincia del Uruguay /Etnography of the Ancient Province of Uruguay/, Paraná, 1936, p. 125 /the second number of this figure is questionable, being barely discernible in the original text/.

Uruguay consisted of only four to eight large rectangular houses.

/15 cont./

342 171 "In 1627 the Jesuits found near Yapeyú a Guaraní aldea with four houses in which some 100 Indians lived. They found identical dwellings in San Ignacio and nearby regions. These houses were quadrangular and extremely long, often in excess of 50 meters."

361 177 178 Even during the time of their independence the Chiriguano had departed from the primordial construction of their towns, which had served in the first place for defense, since at the end of the 18th century Viedma describes their houses as "a few small ranchos made of cane" (61).

[113] 61. Viedma, Francisco de: Descripción de la provincia de Santa Cruz de la Sierra /Description of the Province of Santa Cruz de la Sierra/, Colección Angelis, Vol. 3, Buenos Aires, 1836, written 1793, p. 181. Cited by Nordenskiöld.

000 Photographs of Chiriguano Towns (tenta) and Houses (o)

I.C. 358. Chiriguano boys in front of their rancho in Machareti (Fig. 15).

361 [199] [363] [177] The Chiriguano town of Machareti was built in its present form by Franciscan missionaries, with wide, parallel, and right-angled streets, following the common form of old Spanish colonies, since their construction is not a product of the indigenous Chiriguano culture. But in parts, the houses and [343] primarily the maize storehouses built on posts, correspond to the houses of other Chiriguano towns, on which we have information from Erland Nordenskiöld and Eric v. Rosen (62).

62. Nord. 1, pp. 173, 176. Nord. 2, pp. 1-3. Eric v. Rosen, op. cit., pp. 191 and 192, Figs. 188-192.

/16/

36 62 162 The town Ibitibi in the southern part of Chiriguano territory, south of the Pilcomayo River, examined minutely by Eric v. Rosen, was inhabited, according to the Indians, by about 300 persons. The town was located on a plain surrounded by mountains and forests. The houses formed a large circumference, the cacique's house being in the middle. Some shade trees had been planted in the open plaza between the cacique's house and the other houses. In other Chiriguano towns visited by v. Rosen, houses were dispersed without any order. According to the observations of v. Nordenskiöld too, Chiriguano towns are sometimes quite large and inhabited by around 100 persons. Often several towns are near one another. The houses are generally around a plaza sometimes planted with trees and serving as a place to play and to hold meetings.

342 We know the form of the Chiriguano houses in detail through v. Rosen (63), and primarily through the good photo-

63. Eric v. Rosen, op. cit., p. 191; Figs. 188-192 and 217.

[335] graphs of such houses. The houses are rectangular and their roofs end in points. Walls and roofs are held up by posts. The walls consist either of only vertical poles made from branches or reeds, close together and tied by horizontal ligatures, or of interwoven poles whose interstices are plastered with mud. The roof (opitiá) is covered with straw. One type of house was illustrated in a photograph by v. Rosen (64), on which one

64. Eric v. Rosen, op. cit., Fig. 190.

side of the roof projects at the top over the other side of the [171] roof. The same house type also exists in the ancient culture of the Peruvians, as is shown by sketches found on the surface of ancient Peruvian vessels.

/16 cont./

342 A special feature of Chiriguano houses and where they differ from those of the common ranchos of white residents is that the two oblique sides of the roof descend almost to the ground, passing far beyond the wall. Machareti houses also show this special feature. (Cf. Fig. 14 /see p. 40/.) The result of this roof construction is that the entrance (ōkye) is on the gable side. To shut the entrance they use reed mats or cowhides (65). Widely influenced by the whites, the Chiriguano

[285] [237] [177]

65. Métraux I, p. 469.

and the Chané continually vary the style of their houses, and, according to Nordenskiöld (66), today many of them are al-

66. Nord. 1, p. 173.

ready building houses identical with those of the whites.

343 In addition to the houses used for dwellings, the Chiriguano and some of the Chané have houses built on posts for storehouses (avatió). Also in Machareti such houses were commonly found beside the dwellings. Figure 16 /see p. 41 / shows such a storehouse. A ladder, which consists of a post provided with notches, leads to the platform (on the right in the figure). These storehouses serve primarily as places to keep the maize crop and other produce. The space under the platform serves for storing various other things. Nordenskiöld saw such houses built on posts, whose upper part served in general for storage, while the lower part was utilized as a dwelling (67). Often those

[417]

67. Nord. 1, p. 175; Nord. 2, p. 3.

storehouses are near the plantings far from the dwellings (68).

68. Nord. 1, p. 173.

[335] As shown in Figure 16, the frame for these storehouses consists of ten vertical posts of different lengths, bifurcated at their upper ends to support the horizontal posts that form the base for

/16 cont./

343 the roof and the /Plates V-VII appear here/ /17/ platform.
335 The middle pair of the vertical posts is the longest pair and serves to hold up the ridgepole. Of the other eight vertical posts, always in two, one longer and one shorter, have been placed immediately next to each other all along the two sides of the middle pair of posts and at a certain distance from it. Of the horizontal posts, each one of which is held up by each one of the five pairs of vertical posts, those which are placed on the higher pair and on the two pairs of middle size of the vertical posts serve to hold up the roof, while the two horizontal posts which are placed on the two smaller pairs of vertical posts form the base for the platform of the house. Besides the five pairs of vertical posts that form the frame of the house, there is also added a vertical post of the height of the platform, which serves to support the ladder leading
343 to it. The roof of these storehouses is covered with straw like the roofs of dwellings. The walls are made of reed poles very close together. While the poles of the storehouse illustrated in Figure 16 are horizontal, those of other storehouses, with which we are familiar through Nordenskiöld's photographs and those of v. Rosen and Métraux, are vertical (69). The en-

69. Nord. 1, Figs. 83 and 84 and Pl. 18.
Métraux I, Fig. 9, p. 349.

trance, which must be reached by means of the ladder, is at
[417] the gable end, like that of the dwellings. The ladder consists of a post with notches for steps (70).

70. Cf. Fig. 16, at the right. Nord. 1, Fig. 84. v. Rosen, op. cit., Fig. 191.

[17] [17A] There must be some special reason to explain the surprising fact that the Chiriguano have houses built on posts, since it could not be that they brought the custom of constructing them from their native soil, because the Guaraní have
000 never had them. Nor could it be that they adopted this from

343 [177] /17 cont./ How could it be that they copied this from the whites, because in those regions they have never used houses built on posts. Neither do we have any indications that the ancient Peruvians had such houses. It is very unlikely that the Chiriguano settled in their new territory might have invented the construction of such houses, because the nature of their territory did not render such a form of construction necessary. In South America we find houses built on posts almost solely in regions exposed to floods. Thus we mainly find them in the coastal regions of the northern part of the South American continent, and they appear to the south of the Amazon River only in a relatively narrow zone in the center of the continent including Chiriguano territory. According to Marban in 1878 (71), the Mojo had houses built on posts and

[176]

343 [177]

[113]

71. Marban, Pedro "Relatión de la Provincia de la Virgen del Pilar de Mojos /Report on the Province of the Virgen del Pilar de Mojos/." Boletin de la Sociedad Geografica de La Paz, Bolivia, 1898, p. 132. According to Nordenskiöld.

doubtless such house constructions were quite useful in those marshy and often flooded regions. In addition Nordenskiöld during his travels (72) found one of these houses serving as a

72. Nord. 2, p. 3.

storehouse among the Chacobo, who live north of the Mojo not very far away. Some of the Quichua /Quechua/ houses located between the Chaparé River and the Cochabamba River had been built on posts, but Nordenskiöld himself does not consider this architecture to have been primordial among them. Of the Chaco tribes who have storehouses built on posts Nordenskiöld mentions the Matako /Mataco/. I found such storehouses in the Matako town near Linares, but many of them also in the Churupí installations in Esteros. Nordenskiöld in his publications on the Churupí, whom he calls the Ashluslay, does not

C /17 cont./
343 mention the existence of such storehouses among these Indians,
171 and thus we must suppose that the Churupí adopted this style of house construction only recently and probably from the Matako, with whom they have many contacts. /18/ To complete the data on the spread of houses built on posts, I shall also mention my observations on my expeditions of 1901 and 1910 to the Guató (73). Inside many houses, under the roof

C
Go
[113]

and using long horizontal poles, these Indians build a platform which serves for storing various things. In this special arrangement of the Guató in building their houses, we find the rudiment of the true houses built on posts, and this is motivated by the great floods to which they were exposed even when they had been built in places higher than the marshy lands.

Go
[182]

We should not consider houses built on posts as a product of the primordial culture of the Chaco tribes. It leaves as the only center of its propogation the zone in the interior of the South American continent which we have mentioned, the center of the ancient culture of the Aruaco /Arawak/ of these regions, the territory of the Mojo. The Chané, who were later subjugated by the Chiriguano and incorporated into their community, also belonged to this Aruaco culture. We must thus surmise that houses built on posts, like those we still find today among the Chiriguano and some of the Chané, first originated in the Chané culture and later passed to the Chiriguano when the cultures of these two tribes were fused into a single one.

C
343
174
Ce
343
174
171

No doubt the special construction of these storehouses has a different purpose today among the Chiriguano and the Chané than it had in the beginning. According to Nordenskiöld, the Chané of the lower Parapití River, which is a typically marshy region, do not have such houses, while they are common among the Chiriguano and also among the former who live on solid ground not exposed to floods. Their purpose

/18 cont./ Their Purpose
today among the Chiriguano and Chané, as well as among the Matako and Churupí, is primarily to protect certain provisions against the numerous dogs and other domestic animals who are around in great number in every part of the town (74).

74. Concerning the question of the purpose of houses built upon posts with respect to damage by animals, cf. v. Rosen, op. cit., pp. 192-198.

C
Ce
433
224
226

Food and Drink. Manner of Eating and Drinking.

Hunting and fishing are not very important in the economy of the Chiriguano and Chané. Their territory has relatively few edible animals, and they are not very brave hunters (75).

75. Nord. 2, p. XVI.

C
Ce
224
262

Of animals that can be hunted, they eat the puma and the jaguar, while they scorn vultures, foxes, and the meat of monkeys, so craved by other Indians (76). One contribution

C
Ce
226
184

76. Nord. 1, p. 190.

to their subsistence which is worth mentioning is that from fishing, but only for the Chiriguano and Chané who live near the upper Pilcomayo River, since that river has excellent fishing. These Indians cannot make much use of fishing in the Rio Grande, because today this river can be held to be almost the frontier of their territory. The Parapití River has many fish, but they are very small. While the Chané today live in territories where for several months some fish are available, many Chiriguano towns are so far from the larger streams that fish does not enter into the diet of their inhabitants (77). With

77. Nord. 2, pp. XV and XVI.

231 /18 cont./ with
262 respect to the eating of meat, the Chiriguano depend on their livestock, which, however, according to Nordenskiöld, since they omit the raising of pigs and chickens, is not so numerous as the livestock of the Chorote and the Churupí. They do not
262 241 eat the flesh of asses, horses, /19/ and dogs (78). Although

78. Nord. 1, p. 190.

we do not have exact data on the amount of meat that their livestock yields, we can suppose that it is not very great, and thus these Indians depend principally on vegetable foods, that is, on the products of their agriculture. We should say that, in comparison with maize, all other foodstuffs have almost no importance, except among the Indians of the Parapití, among whom the sweet potato is the most important food (79).

79. Nord. 1, p. 181.

261 In times of shortage they eat various wild plants, principally
273 the sweet pods of the algarroba (November-December), which, coarsely chopped up with water, they allow to ferment in order to produce a kind of chicha which has inebriating qualities (80).

80. Nord. 1, p. 236. Métraux I, pp. 361 and 362.

262 Since meals consist principally of maize, they are very
252 monotonous, although the maize is eaten by them in many different forms, either boiled or parched, or as a flour cooked in steam, as a fried maize-cake, in embers /rescoldo/, or as a soft maize-pudding (81). Meat is eaten roasted or boiled,

81. Nord. 1, pp. 188 and 189. Métraux I, pp. 356-358.

263 together with maize. Cooking salt is used at meals. While
317 previously salt (dyúki) was obtained from mines or extracted
439 from earth from salt licks /barreros/, today it is obtained

C /19 cont./
263 from the whites (82).

Ce
[273] or white maize is preferred. The chicha from potatoes by the Chané of the Parapití River is considered inferior.

C The Chiriguano and Chané ordinarily do not eat from a
Ce common pot, but separately and from dishes. Because of this
264 their houses contain many dishes, which are normally made
415 of baked clay (nyá'e), but may also be of wood (sua) (84).

84. Cf. Nord. 1, p. 190.

C
Ce I collected various baked clay dishes among the Chiriguano
415 and Chané (cf. Figs. 78-80 /see p.143/), as well as two wooden
[126] dishes, two examples of which the Museum already had, donated by Doña María F. de Casati. I shall deal with the baked clay dishes, along with the other baked clay vessels, in the chapter on pottery, and therefore enumerate here only the wooden plates in the collection.

C Wooden Dishes (sua) of the Chiriguano
415

I. A. 351. (Gift of Doña María F. de Casati.) Diam. 21 cm. Ht. 6 cm.
I. A. 352. (") " 15.5 cm. " 3.5 cm.
I. A. 496. (Max Schmidt trip.) Diam. 23 cm. Ht. 6 cm. (Fig. 18).
I. A. 497. (" " ") " 30 cm. " 6.5 cm. (Fig. 18a).

/19 cont./

C 415 As Figure 18, a and b, shows, these wooden dishes have two handles on the rim.

C Ce 412 [177] [439] As an eating utensil the Chiriguano and Chané today use metal spoons which are acquired from the whites. But they also use wooden spoons (85).

C Ce [113]

85. Nord. 2, p. 56. Nordenskiöld, Erland: Vergleichende ethnographische Forschungen I. Eine Geographische und ethnographische Analyse der materiellen Kultur zweier Indianerstämme in el Gran Chaco /Comparative Ethnographic Investigation I. A Geographic and Ethnographic Analysis of the Material Culture of Two Indian Tribes in the Gran Chaco/, Göteborg, 1918, p. 93. (Cited in what follows: Nord. 3.) Métraux I, pp. 364, [illegible]-376, and Figs. 42 and 43.

C 412 /20/ Wooden Spoons (kuruha) of the Chiriguano

I. A. 353. (Gift of Doña María F. de Casati.) Length 36 cm.
I. A. 498. (Max Schmidt trip.) Length 42.5 cm. (Fig. 20).
I. A. 499. (" " ") Length 16 cm. (Fig. 22).

C [177] As Figures 20 and 22 show, there are variations in the shape of these wooden spoons. The shape of spoon I. A. 499 is almost exactly like the Chané spoon shown in a drawing by Nordenskiöld (86), while the shape of spoon I. A. 498 is very

86. Nord. 3, p. 93. Fig. 24 F.

similar to the spoons found in the ancient burials of the Peruvian highland, their front part and handle forming a rather straight line.

/20 cont./

C
Ce
412
17

Although it may be that the shape of the wooden spoons of the Chiriguano and of the Chané may have been influenced in many cases by the shape of the metal spoons acquired from the whites, we must nonetheless regard it as a product of the indigenous culture of South America that in pre-Columbian times had been rather widespread generally among the Andean cultures. Its appearance is quite limited among the native tribes of South America, setting aside the cases where it has been imported by the whites. But it is quite common among the Indians of the regions near Chiriguano territory in particular, for example, among the Tapieté and many other Chaco tribes, such as the Toba, Matako, Churupí, and especially also among the Mojo and, farther to the east, among the Guató. It must be supposed that the Chiriguano received this cultural possession directly or indirectly from the culture of the Andean montaña.

Shells (ínta) as Eating Utensils

Ce
237
415

I. A. 734 and 735. (Izozó.) Length 12 cm. and 10 cm.

Outside of the spoons mentioned, the Chané-Izozó also use shells as eating utensils.

Ce
415
[824]

As vessels for drinking water and chicha, they above all use cuyas /vessels made from gourds/ (cf. Figures 24-26 and 149; 150; 153) and calabashes (cf. Figures 42 and 151). For the chicha festivities this beverage is ordinarily taken out of the painted baked clay pots in cuyas with designs on them, which are passed around among those present. Of the cuyas that I acquired from the Chiriguano in Machareti many have either incised or pyrographed designs, with which I shall deal in the chapter on art. The cuyas received from the Izozó do not have designs on them, which is easily explained by the peculiar circumstance that the Izozó were at that time living near Toledo. Three of the calabashes received from the Izozó (cf. Figure 42 c) were made from the fruit of the

C

Stimulants

The Izozó whom I found in Toledo were not smokers. They attached no importance to the tobacco and pipes that I offered them. I acquired from the Chiriguano a simple wooden pipe, straight in shape, of the kind commonly used among the tribes of the Chaco, but I have seen no other pipes among them; neither have I seen them smoking.

Body Care and Rest

C
Ce
515

The Izozó in Toledo and the Chiriguano in Machareti offer a contrast with the Indians of the Chaco whom I visited in that they are relatively clean. We must recognize that this cleanliness, which has also been praised by other authors, occurs despite the fact that a great many of them live in regions with very little water and where often the quantity cannot satisfy the necessities of cleanliness except with great difficulties. According to Nordenskiöld, they bathe several times a day and often directly after eating. After meals they wash their mouths and their hands (89).

[352]

C The hammocks that I acquired among the Chiriguano in
352 Machareti were all made of wool, as were the hammocks that
286 Métraux saw among the Chiriguano (92). According to

92. Métraux I, p. 470.

Nordenskiöld (93), Chiriguano hammocks are commonly made

93. Nord. 2, p. 12.

C of cotton and only incidentally of wool. Of the three large
286 hammocks in the collection, two (I. A. 448 and 449) were
352 plaited with the technique very common among the Indians of
126 South America, which in my publication on the Guarayú, which appeared in this same journal, I called "double thread plaiting" (Doppelfadengeflecht) (94), while one (I. A. 450) shows the

94. Cf. Fig. 102b /see p.174/.

Ce structure of a piece of weaving. (Cf. Fig. 102a) From the
286 Chané the Museum's collection has hammock I. A. 360, which
352 Mr. Teodoro Rojas acquired among the Indians of the Parapití
[126] River and presented to the Museum. (Fig. 102c.) This hammock was made of caraguata fibers and with a netting technique. According to Nordenskiöld, in addition to such hammocks of caraguata fiber the Chané have others made of cotton, on the technique of which we have no information.
C With regard to the details of these Chiriguano and Chané
Ce hammocks, I refer to the chapters dedicated to the description
286 of the technique of plaiting and the technique of preparing netting.
352

/22 cont./

352 The Chiriguano generally sleeps on a kind of cot (catre),
513 that is, a bed frame made of cane. Such beds, which in
[251] addition to their own purpose also serve for drying maize, have been represented in drawings by Eric v. Rosen (95), Erland

95. Eric v. Rosen, op. cit., p. 190.

[174] v. Nordenskiöld (96), and Métraux (97). No doubt /23/ the
[178]

96. Nord. 2, Fig. 2.

97. Métraux 1, Fig. 125, p. 470.

cold climate of the region to which the Chiriguano had emigrated made them abandon the use of the hammock for sleeping, not very practical for such a climate, and replace it with the cot, which was already common among the tribes of those
[232] regions. Lacking a cot, the Chiriguano sleep on the ground.
[824] In that case they use for a bed large mats made of cane or palm
[126] leaves, or also hides (98). I acquired from the Chiriguano one
[824]

98. Nord. 1, p. 177. V. Rosen, op. cit., p. 200. Métraux 1, p. 470.

such mat plaited out of palm leaves (Fig. 95).

Chiriguano Mat (túpa) in the Collection

I. A. 540. Length 1.75 m. Width 1.50 m. (Fig. 95).

352 In some Chiriguano houses I also saw wooden benches
17 (apika), but unfortunately I could not acquire a specimen.
[126] Those benches in the form of a sled are very similar to the kind of benches that are very common among the Indians of Brazil (99) and those that we also know from the ancient

Painting and Deformations of the Body

As the use of clothing has increased among the Chiriguano and Chané, the custom of painting or tattooing the body has naturally lost importance and the remnants of such customs are too few to be able to say what they were in the past. Nor do we have data on this. I often saw Chiriguano and Izozó women and girls paint themselves with urucú, making colored spots on their faces. According to Nordenskiöld, men and women sometimes paint their faces, as well as their bodies, with red paint (102). Nordenskiöld also found tattooing on

C
Ce
302

C
302

301
304
174
Gi
301
172

With respect to body deformations we can suppose that it was once a common custom among the Chané and Chiriguano to wear a "tembetá" in the pierced lower lip. Of the Guaraní of ancient times it has been stated that the men had this tembetá, and the custom is confirmed by prehistoric finds (106).

106. Cf. Antonio Serrano, op. cit., p. 122.

Ee
301
174

The form, material, and dimensions of these tembetá were varied and varied regionally. What was the shape of the tembetá that the Guaraní had when at the beginning of the 16th century they emigrated to the spurs of the Cordillera? We do not know. Neither do we know whether or not the Chané had the tembetá when they were enslaved by the Chiriguano. We can assume that the metal tembetás of the Chiriguano and the Chané in their present form have their origin in the period after their contacts with the ancient Peruvians. /24/ since they did not know the technique of working metal and even today most of their tembetás are made by nearby mestizos or whites, who make them to their taste. According to Chomé's (107)

C /24 cont./
301 account, Chiriguano men wore small cylinders of tin, silver, or resin in the pierced lower lip. It can perhaps be surmised that the aforementioned silver tembetás of the Chiriguano
C were formerly more common among them. According to
Ce Nordenskiöld, at the time of his trip, that is, in 1908 and
301 1909, all the Chiriguano and Chané men of the older generation, and in a few Chiriguano villages the young men and boys, wore the tembetá. Among the Izozó whom I saw in Toledo and in "15 de Agosto" only the old men had the tembetá (cf. Fig. 27 and 28 /see p. 61 /), and among the Chiriguano in Machareti I did not see any men with them.

Ce
301 Tembetás in the Collection
126

I. A. 729.	Izozó.	Length of the base 2.6 cm. Height of the cylinder 0.9 cm. Diameter of the cylinder 1.5 cm. (Fig. 28b.)
I. A. 730.	"	Length of the base 2.8 cm. Height of the cylinder 1.3 cm. Diameter of the cylinder 1 cm. (Fig. 28d.)
I. A. 731.	"	Length of the base 2.5 cm. Height of the cylinder 1.3 cm. Diameter of the cylinder 0.8 cm. (Fig. 28a.)
I. A. 732.	"	Length of the base 3.2 cm. Height of the cylinder 1.4 cm. Diameter of the cylinder 1.8 cm. (Fig. 28c.)
I. A. 733.	"	Height 2 cm. Diameter 1.8 cm. (Fig. 28e.)

The form of the first four tembetás mentioned is that of a cylinder placed on a base of the same metal. On the front surface of the cylinder is placed a disk of semiprecious stone, blue or green, which in three cases exhibits a round perforation in the center, which in two cases is filled with metal. The stone disk
Ce of the tembetá I. A. 729 is broken. The tembetá I. A. 733 is of
301 wax and has the form of an obtuse cone. The tembetás described by v. Rosen and v. Nordenskiöld are different from

Ce
301

/24 cont./

those mentioned in that on the front surface in place of the semiprecious stone there were placed small blue or green stones, or also glass beads of the same color, placed inside a covering of wax with which the cylinder was filled. A good representation in a drawing of such a Chiriguano tembetá with glass beads has been published by v. Rosen (108).

108. v. Rosen, op. cit., p. 202.

C
Ce
301

According to Nordenskiöld (109), the Chané tembetás

109. Nord. 1, p. 211. Nord. 2, pp. 71-77.

are generally smaller than those of the Chiriguano. Comparing the measurements of the tembetás I acquired among the Izozó with the measurements given by v. Rosen, this statement is justified with respect to the length of the base of the tembetás and with respect to the diameter of the cylinder. Certainly also these differences between the larger tembetá of the Izozó and the tembetá described by v. Rosen are very slight, this difference being only 3 mm. with respect to the length of the base and only 2 mm. with respect to the diameter of the cylinder. In contrast to this, the cylindrical part of three of these Izozó tembetás is rather higher than the corresponding part of the tembetá described by v. Rosen. While the height of the latter measures only 1 cm., the cylinders of the three Izozó tembetás have a height of 1.3-1.4 cm. The height of the fourth Izozó tembetá is almost like that of the aforementioned Chiriguano tembetá, being 1 mm. less than the latter. /Plates X-XI appear here./

/25/

Ce 301 The way these tembetás are used has often been described. Figure 27 shows an Izozó man from whose pierced lower lip projects a round stone disk. When these Indians use the tembetá, they pass it from the inside through the perforation in the lip so that its base is between the row of lower teeth and the lower lip, with the cylinder sticking out from the lip.

C Ce 301 The lower base of three of the Izozó tembetás is quite flat, and only the lower base of tembetá I. A. 129 has a clearly concave form. This is of interest because v. Nordenskiöld and v. Rosen, when they describe the Chiriguano and Chané tembetás mention only those which have a concave base (110).

110. Nord. 2, p. 72.

According to Nordenskiöld, the Chiriguano and Chané sometimes use wooden tembetá's in the form of flat cylinders (111).

111. Nord. 2, p. 72.

Ce 301 237 [123] As already mentioned, I obtained simple wax tembetá from the Izozó. The old man who took it out of his lower lip to give it to me doubtless was using it provisionally for lack of another tembetá, in order to close the perforation in his lower lip and prevent the saliva from coming out.

C Ce 304 301 [622] The Chiriguano and Chané ordinarily do not have the custom of piercing their ear lobes. According to Nordenskiöld (112),

112. Nord. 2, p. 77.

C Ce [177] Ce 301 the caciques formerly used pendant earrings set with green stones. If the younger women and girls have recently begun to use earrings, they are imitating this custom of the whites. The cacique of the Izozó in Toledo told me that the women had gold and silver earrings, which at that time they had hidden.

event of the death of the husband or one of their close relatives; sometimes they cut it twice when the husband dies (115).

115. Nord. 1, p. 220.

C
Ce
301
126

At the nape of the neck, and sometimes also at the top of the head, the hair is tied together with cotton bands. The collection which I brought to the Sociedad Cientifica del Paraguay contains 29 of these bands used by Izozó women, all of which have the same typical form.

Ce
301

Bands for Women's Hair, from the Collection

(I. A. 624-652.) (Izozó.) (I. A. 646 and 641 shown in Fig. 32a and b.)

The length of these bands for the hair, on the average, is 1.04 cm. /sic/. The longest band measures 1.45 meters, and the shortest, 0.65 meters. The average length of the tassels is 14.3 cm. The longest tassel measures 17.5 cm.; the shortest, 9 cm.

Ce /26/
301 The form of these bands, all of which have been made of cotton, is in general the same. As Fig. 32 shows, they consist of a long middle part which has at its two ends a sort of tassel made up of some strings provided with knots. The middle part generally consists of a cord plaited with three skeins of thread like a braid. But it can also be in the form of a band if more than three skeins of thread have been plaited as shown in Figure 32a. The tassels of these bands are made in the following way: The ends of the threads of the middle part are wrapped by another thread in such a way that knots are made with the same thread, one directly after the other or at a certain distance apart. The number of these pendants with knots varies between three and eight with regard to the bands in the collection, but in only four cases is the number over five.

From the figures given with regard to the length of these hair bands, it can be seen that their length can differ greatly. The longest band measures more than twice the length of the shortest in the collection. The bands have been made of threads of very different colors. Thus there are among them white ones, blue ones, or some of a violet or gray-brown color, with different shadings up to almost black. Generally, the middle part and the thread that forms the knots of the tassels are of the same color. Only in the case of band I. A. 629 is the color of the middle part different from that of the tassels.

C
301 According to Lehmann-Nitsche, some of the Chiriguano women who were the subjects of his anthropological investigations also wore such bands in their hair, and therefore we can consider these to be a cultural possession common to the Izozó and the Chiriguano. But, according to this author, those that he saw among the Chiriguano women, which he describes as "cords decorated with a series of knots," were made of wool threads. The Chiriguano women used them in such a way that their hair was interlaced with them (116).

116. Lehmann-Nitsche, op. cit., p. 56.

C /26 cont./
301 One head ornament used by the Chiriguano women at festivities and as a special mark of distinction is still to be mentioned. This ornament, described by Nordenskiöld, is made up of a forehead band with a long pendant tied to the back part as decoration (117).

117. Nord. 2, pp. 92 and 93 and Fig. 28.

C
Ce
302 The Chiriguano and Chané men today in most cases wear their hair in the modern fashion, cut short. The two Chiriguano boys shown in Figure 7 are even wearing a side part with rodete /hair arranged on the top of the head/, perhaps
Ce especially prepared for the photograph. The hair of the Izozó
302 boy shown in Figure 11 is rather long on the front part of the head, but the hair has been cut in the back and on the sides as
C well. Only the older men, and, according to Nordenskiöld,
302 in the Chiriguano towns of the upper Pilcomayo River the young men as well (118), wear the hair long and wrapped in a special

118. Nord. 1, p. 202.

manner around the head. Lehmann-Nitsche (119) reports to

119. Lehmann-Nitsche, op. cit., p. 56.

us specifically on this hair style of the old men as follows: "Their hair had apparently never been cut and was combed in a special manner; after it had been thrown to the back, they would part it into two halves with their hands, to the right and to the left, respectively, then the right half is brought forward and wrapped toward the left around the head
C in the form of a Muslim turban, while the left half is wrapped
[301] around the other way." The rodetes of the Chiriguano men described by Lehmann-Nitsche were tied up with ordinary
Ce handkerchiefs. Among the Izozó I found some narrow bands
301 /27/ which were used especially for this purpose, and
302

Ce 301 302 /27 cont./
Nordenskiöld shows in a photograph a Chané man with such a band (120). According to information in the Annuae

C 302 171

120. Nord. 1, Plate 20.

litterae Societatis Jesu of the year 1605, the Chiriguano men previously wore a tonsure like that of the Guaraní in Paraguay and the Tupinambá on the Brazilian coast: "Coronis in modum nostrorum sacerdotum utuntur" /coronal in the style of our priest/ (121).

121. Métraux I, p. 467.

Ce 301

Men's Hair Bands

I. A. 653-660. (Izozó), woven of cotton. (Fig. 30: I. A. 660, 653, 655, 656.)

The average length of these men's hair bands measures about one meter. The longest is 1.18 meters and the smallest 0.91 meters. Although the length of all of these bands is almost the same, there are quite big differences in their width, the width varying between 1 cm. and 3.3 cm. The narrowest of these bands were woven plain, without decorations, and are in part white, in part later dyed with blue, red, or blue-gray dye. The two widest bands, 3.0 and 3.3 cm. wide, respectively, show simple ornamentation produced by the weaving. I shall deal with the details of the technique of this weaving and its ornamentation in the chapters on weaving and art.

Beside these bands woven out of cotton, the Izozó have men's hair bands which are longer and wider and woven out of human hair, ending in fringes at the two ends.

/27 cont./

Men's Hair Bands Woven out of Human Hair

Ce 301 439

These bands woven out of human hair correspond, with regard to their manufacture, to the bands that the Chiriguano and Chané make today in great numbers to sell to the whites. These "fajas," as they are commonly called today, represent an article eagerly sought by the whites who are in contact with these Indians, and especially by the soldiers, who wear them as a belt. One of the two Chiriguano men shown in Figure 6 wears such a faja as a belt, and, because we can surmise that today this is their principal use among the Chiriguano as well, we shall deal with them in the following chapter devoted to the description of clothing.

C 301 291 178

C 291 177

Straw Hat (kandáo of the Chiriguano

I. A. 554. Diameter 30 cm. Height 12 cm. (Fig. 99.)

The technique of this hat plaited out of palm-leaf fibers is not native since it is of modern manufacture. As Figure 9 shows, the Izozó men also wear such hats.

Ce [291] [177]

Caps Made with Crochet Hooks

I. A. 442 and 443. (Chiriguano.) Made of Wool. Height 15.5 cm. and 14 cm., resp.

These two crocheted wool caps, which I obtained from the Chiriguano in Machareti, must also be considered as of modern manufacture.

Combs (kívua) in the Collection

C
Ce
412
322
[126]

I. A. 740. (Found on the road between Capirenda and Garrapatal. Length 9.5 cm. Width 9 cm. (Fig. 29a.)
I. A. 1327. Izozó. Length 7.5 cm. Width 3.5 cm. (Fig. 29b.)

The two combs in the collection, coming from the Izozó, represent two completely different types of comb. To the first type belongs the comb I. A. 740, which is made up of some little wooden sticks held together between two transverse pieces of cane interwoven with threads. (Cf. Fig. 29a.) The comb of the second type, I. A. 1327, has simply been carved from a single piece of flat wood. (Cf. Fig. 29b.) A comb similar to I. A. 740, coming from the Chané, is shown by Nordenskiöld in a drawing (122). The three Chiriguano

C
412
322

122. Nord. 1, Fig. 109.

combs shown in a drawing by Nordenskiöld (122) /see footnote 122 above/ belong to the second type and have been carved from wood, like the Izozó comb I. A. 1327. But in contrast to this one, the upper parts of their backs have been carved. Likewise the Chiriguano combs shown in drawings by v. Rosen and Métraux (123) are decorated with such carving.

123. V. Rosen, op. cit., Fig. 196.
Métraux I, Plate 87.

C
Ce
412
322
171

Up to now there has been some doubt as to how these two different types of combs might be distributed among the Chané and the Chiriguano. According to Nordenskiöld (124),

124. Nord. 2, p. 81.

the Chiriguano only have combs carved from a single piece of wood, and the Chané commonly have the type of comb with small sticks and rarely the simple comb carved from wood.

/28 cont./

C
Ce
412
322
171

V. Rosen and Métraux found among the Chiriguano combs made of little sticks (125), and, as already mentioned, I obtained these

125. V. Rosen, op. cit., p. 202. Métraux I, pp. 467 and 468 and Fig. 123.

two types of comb from the Izozó. According to this, I believe that we must decide the question of the manner by which the two types of comb appear simultaneously among the Chiriguano and among the Chané, but noting first that among the latter the comb made of little sticks is more common and among the former the wooden comb is more common.

Because the diffusion of simple combs carved from wood, like those that the Chiriguano and the Izozó-Chané have, is relatively restricted among the other tribes of South American natives, while this type of comb was known to the ancient Peruvian culture, we must also include this cultural possession among the ancient Peruvian influences (126). The combs fitted

126. Nord. 2, p. 81.

with little sticks, which we know from the Chané and the Chané-Izozó, are different from such combs used by most of the Chaco tribes, for example, by the Churupí /Chulupi/ and the Maká /Maca/, not only with respect to its material but also with respect to its method of manufacture. But I do not accept Nordenskiöld's opinion, according to which those Chané combs are different, in that they are only usable on one side, from those of the Chaco tribes, which were usable from both sides (127). The Chaco Indian combs furnished with little

Ce
[114]

127. Nord. 1, p. 204. Métraux I, p. 467.

sticks that I am familiar with are also used only on one side for combing, inasmuch as the other side is the handle. We can be quite sure of that because the little sticks of cane that form the teeth of the comb are pointed at only one end. The

000

Ce 322 412 171

/28 cont./ The main difference between the Chané combs and the combs of the Chaco tribes is that the teeth of the latter are made of little sticks of cane, and the teeth of the former, of little sticks of any other kind of wood. The /29/ wooden teeth of the Izozó comb in our collection are between two flat little sticks of cane vertical to them, and on the handle end, between the little sticks whose lower parts form the teeth, shorter little sticks have been inserted, so that at the lower part of the comb there is a certain distance between the teeth. The lacing, consisting of cotton threads, covers the upper part of the comb as far as the edge, but also slightly covers the lower part which forms the teeth. The lacing is not secured with wax.

Ce 322 412

Ce [284]

With respect to hair care, we still must mention the data of Nordenskiöld and of Métraux (127) /see footnote 127 above/ to the effect that the Chiriguano and some of the Chané rub their hair with "Nyantéra" seed ("ñitira," according to Métraux), and the Chané of the Parapití with the rind of the mistol /Zizyphus mistol/. "yuag."

Ce Ce 302 824

From Father Lizárraga's description (128), we know that

Ce Ce 302 178 [171]

128. Moreno II, p. 101.

the Chiriguano and Chané in the past plucked out the hairs of the body, except from the head, as do most of the Indians of South America. Father Lazarraga /sic/ says that the Chiriguano plucked out their eyebrows and eyelashes. This custom does not exist today, and the photographs of nude Chiriguano men shown by Lehmann-Nitsche (129) show that today as a general

129. Lehmann-Nitsche, op. cit., Fig.

rule they do not remove hair from the pubic regions. Also one meets today some middle-aged men who have mustaches, such as the cacique of the Izozó shown in Figure 10 and some of the Chiriguano men shown in drawings by Lehmann-Nitsche (130).

130. Lehmann-Nitsche, op. cit., Plates VIII-X.

C
Ce
412
301
302
178

/29 cont./

Because of this change the implement for plucking hair, consisting of small tweezers, formerly very common, has naturally lost a great part of its importance today, and similarly, in its transformed state as a chest ornament, it is rarer. I found such tweezers among the Mataco and the Churupí. Unfortunately I did not succeed in acquiring such tweezers or the corresponding chest ornament, called "boivera" also by the Chiriguano. Nordenskiöld describes these tweezers in detail (131),

131. Nord. 2, pp. 81 and 82.

and he adds that the Chiriguano also use small sticks of cane to pluck out hair.

C
412
301
171

The form of these tweezers made of metal corresponds to that of the tweezers known through finds made in the burials of the ancient Peruvians. Today these tweezers are normally made of any piece of tin plate or sheet iron, which, when provided with a cord, they use for chest ornaments, besides their original purpose. This custom of using tweezers as a chest ornament was very common among the ancient Peruvians. Among the latter's necklaces there are many that, apart from other things, consist of silver tweezers. It was customary among the ancient Peruvians that these enlarged tweezers, unsuitable for their original purpose, be transformed into a pure and distinctive ornament. The Museum of Ethnography in Berlin has such ornaments in the form of depilatory tweezers, made of copper, silver, or gold, in great number, one example of which is 52 centimeters in length (132). Therefore I suppose

C
301
[174]
C
[113]

132. Cf. Max Schmidt: Kunst und Kultur von Peru, Berlin, 1929, pp. 83, 369, 397, and 399.

we must deduce that the Chiriguano custom of using as a chest ornament a silver ornament in the form of one of those tweezers is due to ancient Peruvian influence. There are several specimens of the "boiveras," now rare and doubtless most of the time carefully kept from the view of the whites, in

/29 cont./

301 [439] European museums. These are not made by the Chiriguano themselves, but by their mestizo neighbors and sold to the Indians. The external form is still that of tweezers, much enlarged. But the boivera of today, discounting its size, also cannot be used for plucking hair because the two parts /30/ of its lower edge have been soldered. The fact that the decoration of the surface is not still primordial is explained by the fact that the Chiriguano are not the makers of these ornaments.

291

Clothing and Adornment

From the 16th century we have the brief description of the Chiriguano by Bishop Lizarraga (133) where, among other

[113]

133. Lizarraga: "Descripción et población de las Indias /Description and population of the Indies/." In Moreno II, p. 101.

things, it is said: "They go about naked or at the most sometimes have a short shirt /camisatilla/ down to the navel." We can assume that this statement by the Bishop as of that time refers only to the Chiriguano men, because it is likely that by the time of their immigration the Chiriguano women were wearing a garment which covered their genital organs, as we know the Guaraní women of the ancient Province of Uruguay did (134). It is likely that this garment had the same form as

174 291 [191]

134. Serrano, op. cit., pp. 123 and 124.

the "tipoy," which is a garment in the form of a poncho without sewing and which even today is very common among Chiriguano and Chané women, as well as among various other Indian tribes of South America.

/30 cont./

Ce 291 177 C [291] [177]

The Chiriguano and Chané men whom I saw were dressed in the European manner, as, according to Nordenskiöld, is the common custom among them today (135). Yet many

135. Nord. 2, p. 59.

Izozó men whom I met in Toledo did not have such complete European clothing. Several of them had no shirt, and various others, especially young men and boys, went about without trousers. But no doubt such a state was only temporary, a result of the exceptional condition of the Izozó transplanted from their usual districts to Toledo. When I passed out clothing to these Indians in Toledo, all of those who were lacking garments presented themselves. On the following day this scarcity was more evident among those attracted by the donations made on the day previous. Most of the boys appeared trouserless then, because they had seen that those who had not had such an article of clothing had been favored on the day before.

Ce [123]

C Ce 291

Of the native garments the men still use the one called "chiripá," the poncho, and the simple manta. According to Nordenskiöld (136), they sometimes still wear a "tirucumbai"

136. Nord. 2, p. 59.

shirt, which consists of a poncho whose two sides have been sewed together up to the arms.

The chiripá consists of a quadrangular piece of material which passes between the legs and whose two ends are stuffed, before and behind, into a belt. Worn in this way, the chiripá covers the genital organs. Figure 11 shows an Izozó boy dressed in such a chiripá. Nordenskiöld also shows a drawing of a Chané boy dressed in a chiripá (137). According to

137. Nord. 1, Fig. 110.

this author, the chiripá is also often used by the Chiriguano and Chané men when they are working.

/30 cont./

C
Ce
291
[439]
[126]

The poncho is a garment in common use even today among Chiriguano and Chané men and boys during the cold season. Figure 17 shows a Chiriguano boy wearing a poncho. Because ponchos today, like the fajas, are an article eagerly sought by the whites and are often made to be sold commercially, I tried to collect only ponchos worn by the Indians themselves.

C
Ce
291

In order to explain the above-mentioned measurements we must say that the measurements of length refer to the entire length of the poncho when stretched out. As Figure 17 shows, the poncho is used in such a way that the slit, being in its center,

/31 cont./

C
Ce
291

is brought over the head so that the slit is in the direction of the middle axis of the human body and the middle of the poncho across the shoulders, one part hanging in front and the other behind. Thus the distance between the lower edge of the poncho and the shoulders of the man who is wearing the poncho corresponds to half the length of the poncho when stretched out. Only in the case of two of the Izozó woolen ponchos is half the length equal to the width. I shall deal with the manufacture and decoration of these ponchos in the chapters on the technique of weaving and art.

Ce
29
286
513
126

The Chané of the Parapití River still often wear mantas woven of wool, which they also use to sleep on or to cover themselves with when they are sleeping (138). I have acquired

138. See Nord. 1, p. 202.

nine of these mantas from the Izozó, four of which had been made from ponchos, the slit in the center of them having been closed by sewing. Among the other four mantas which had been made as mantas from the first, the relationship between the length and the width can vary greatly. There are some nearly square and others three times as long as they are wide.

C
291
286
296

From the Chiriguano in Machareti I obtained only one piece of woven material which corresponds to these mantas, and it was already much mended.

/32 cont./

C 291 I have already mentioned fajas, used today as belts by the Chiriguano men, in the chapter on cutting and combing the hair and head ornaments. I shall deal with their manufacture and decoration in the chapters on the technique of weaving and art.

Fajas (Izozó: kuakuá in the Collection

C Ee 291 [126] I. A. 428-441. (Chiriguano.)
I. A. 738, 803-807. (Izozó.)

Only the Izozó faja I. A. 738, shown in Figure 414, which measures 1.30 m. long and 3.7 cm. wide, differs with respect to the technique of its manufacture and its decoration, which we must attribute to outside influences, from the other fajas collected among the Chiriguano and Izozó. These correspond to one another quite minutely with respect to their dimensions, the weaving technique, and the ornamentation. Moreover, these Izozó fajas have been woven exclusively of cotton and the Chiriguano fajas have been woven exclusively of wool, with the exception of one (I. A. 434), whose warp contains not only cotton threads, but also wool threads. All these fajas are more than 2 m. long. The longest of the Chiriguano fajas measures 2.86 m.; the longest of the Izozó, 2.70 m. The width of the Chiriguano fajas varies between 8.5 and 16 cm., and that of the Izozó ones, between 10 cm. and 19.5 cm.

C Ee [178] The women and girls, much more than the men, have preserved their original garb, which consists of a "tipoy." As the photographs in Figures 3, 4, 8, 12, and 14 show, the modern shirt or jacket made of modern material has often been added to the tipoy, but has not replaced it; the wife and three daughters of the Izozó cacique shown in Figure 12 are wearing the tipoy, as are almost all the Chiriguano women shown in Figure 4. Certainly most of the time the tipoy is used as a skirt, the upper part being rolled over the hips like a long belt.

/32 cont./

Ee 291 The cacique's wife and the eldest daughter shown in Figure 12 wear the upper part of the tipoy over one shoulder. The oldest woman shown in Figure 14 wears the tipoy in the old fashion, securing it with pins or cactus thorns above the two shoulders (139),

139. Cf. v. Rosen, op. cit., p. 201.

so that two openings remain, through which the two arms can pass. Photographs shown by Nordenskiöld (140) and v. Rosen

140. Nord. 1, Fig. 106.

show that there are still other variations in the way of wearing the tipoy.

Ee 291 126 I obtained from the Izozó three of their tipoys, two of which were woven of cotton and one of wool.

Tipoys in the Collection

301
177

Of Chiriguano and Chané ornaments there have already been mentioned in the preceding chapters the hair ornaments, the tembetá, men's ornament in the form of hair-plucking tweezers, and the earrings now used by women. Among other ornaments the only important ones are the women's necklaces. Most of the women I photographed were provided with necklaces (mbo'ĩ) which consist exclusively of imported objects, such as glass beads, metal pendants, and similar things, and for this reason they have no ethnological importance. Nordenskiöld saw among these Indians necklaces made of beads of turquoise and "chrysocol" /chrysocolla/ and of black seeds (142). V. Rosen shows in a drawing such a

142. Nord. 1, p. 201. Nord. 2, p. 92.

Chiriguano necklace made of turquoise and glass beads (143).

143. V. Rosen, op. cit., Fig. 198.

According to that author, these necklaces were sometimes also used by men (144). Silver pins for fastening the tipoys,

144. V. Rosen, op. cit., p. 203.

in the form of those of the ancient Peruvians, can still be found also. But these too are not the product of an original industry, but are received from outside silversmiths (145).

145. Nord. 2, pp. 93 and 94.

Ring (moĩkaregua) in the Collection

I.A. 1321. (Chiriguano.) Gift of Father Ayala Solis. Diam. 2cm.

Finally I shall mention here a ring obtained by Father Ayala Solis from the Chiriguano and donated by him to the Museo de Historia y Etnografía del Paraguay. The ring was made of metal from a cartridge shell.

Ce 291

The cacique of the Izoṍ shown in Figure 12 wears sandals (Chir.: mbipásu. Izoṍ: pĩapá). Generally the men and women go around barefoot. But both sexes use sandals if they are to walk on stony or thorny ground (146).

146. Nord. 1, p. 203. Nord. 2, p. 69, Fig. 23. V. Rosen, op. cit., p. 207.

C 291 19

The region of distribution of the sandal in South America leads us to assume that the Chiriguano did not first receive this item from the whites, but earlier, and that it came from the culture of the ancient Peruvians (147).

147. Cf. Nord. 2, p. 69.

Treatment of Illnesses and Burial

Ce 743 Ce [114] C [114] Ce 756 191

In the Indian settlement in Toledo there was arranged a small hospital in which the sick Izoṍ were receiving medical treatment. For that reason I did not have the chance to make investigations among them about the native treatment of the illnesses of these Indians. Nor did I have the chance to make such investigations in Machareti. Therefore, I refer to the investigations /34/ Nordenskiöld and Métraux made on this subject (148), and I wish only to

148. Nord. 1, pp. 216 and 217. Métraux 1, pp. 480-488.

mention here that among the Chiriguano and Chané, as among

C
Ce
754
171

/34 cont./

most other Indians of South America, there is a professional physician who is charged with the treatment of the sick, this treatment in most cases consisting of sorcery among these Indians too. The physician attempts to dispel the evil by sucking out foreign objects which have penetrated the body of the bewitched sick person. In addition to such treatment, remedies are used among the Chiriguano and Chané, which, in addition to those made of plant substances, include the fat of various animals applied externally for different illnesses. The Chané treat wounds with boiling water.

782

Burial among the Chiriguano and Chané who live outside the missions is generally still done in urns, according to primordial custom. According to Nordenskiöld (149), the

Ce
764
415

149. Nord. 1, p. 208.

large pots in which chicha is prepared are also used as funeral urns, and another pot is used to close the urn. Often the dying person, even before being completely dead, or soon after death, is crammed into the urn in a squatting position. A calabash of water is placed with the dead person in the urn, which is buried within the house. Commonly the house, after the burial, is abandoned for some time, but is occupied again later. Such a funeral urn of the Chiriguano of the Caipipendi Valley is shown in a drawing by Erland Nordenskiöld (150).

Ce
768
C
764
415

150. Nord. 1, Fig. 113.

Up to half of the urn, which is provided with a cover, is dug-entered. Nordenskiöld's statement that the Chiriguano use the same pots which serve for the preparation of meals as funeral urns is significant. From that we can deduce that a funeral urn found in other regions might also have served, during the lifetime of the dead person buried in it, some other purpose related to the economy of those Indians.

Play

Ee 924 (857)

Of the different kinds of games, those found among the Chiriguano and the Chané are those of movement, those of skill, and those of chance. But the games of movement are only performed by children.

Ee 526

Among the games of movement we must mention here principally the game of ball, struck with the head. Nordenskiöld saw Chané boys play this. A solid rubber ball is first thrown into the air, and two teams parry it with their heads, without touching it with the hand. This game, called "uki" by the Chané, no doubt was much more common in former times and was also practiced by adults. This was stated to me by the cacique of the Isoso in Toledo and was stated long ago by the author of Lizarze Annuae for 1605 with regard to the Chané (151).

151. Lizarze Annuae, 1605, p. 409.
According to Nordenskiöld 2, p. 101.

Ee 923 526

It also follows from a Chané legend noted by Nordenskiöld (152).

152. Nord. 1, p. 281.

According to this legend, the fox "Aguarotumpa" sets the white condor free only on the condition that he obtain a white rubber ball. In what follows, the legend describes in detail how first the ostrich "Yando" plays with the bat "Andira" with this ball, hitting it with his head. When the White Condor came flying out with the white ball, the Demon Aguarotumpa orders a bird to get a black rubber ball, and with this he plays the entire town, and the ostrich "Yando" this time with the fox Aguarotumpa. /26/ The latter exchanged his ball for a stone and threw it at the ostrich. The latter, stopping the stone with his head, died.

/35 cont./

This legend, from which I am mentioning here only the parts referring to the game of ball struck with the head, clarifies for us several interesting points about this Chané game. In the first place it shows us that it was difficult for the Chané to obtain within their territory the material necessary for the balls, because there is no rubber there. Just as the Chané today buy their rubber balls in Santa Cruz de la Sierra, so formerly they must have had to obtain them from afar. In addition, the distinction between the two different kinds of balls in the legend, the white one and the black one, is interesting. The black ball no doubt corresponds to the solid rubber ball with which the Chané children still play this game today, while the white ball doubtless corresponds to the type of ball with which I saw the Cozarini-Paressi, or Paresi-Kabíchís /Cabishi/, play in 1910. This rubber ball of the Paresi-Kabichís, light in color, more or less white, was hollow and therefore, in spite of its relatively large size, very light and bouncy, and therefore much more satisfactory for hitting with the head than a solid, hard rubber ball. Unfortunately, Nordenskiöld gives no information on the size of the solid rubber balls of the Chané, but we must assume that they are small, because contact with a solid rubber ball of the Paresís-Kabichís would be too hard for a head, especially for a child's head. In several legends of the Paressís in Utiariti (Mato Grosso), which I recorded in 1928 but have not yet published, there figures a game with the ball hit with the head. Also in these legends there are deities who play this game and it has an absolutely religious character. It is related that the deity of the moon, the day before his nuptials with his sister, plays this game with his brothers, and in another legend they play it as they do in the Chané legend, between animal demons. The turtle plays ball with the young son of the jaguar, and, his ball being of stone, kills him with a shot aimed at the head. Thus there is also a parallel here with the Chané legend in which the fox kills the ostrich with his ball changed into stone.

/35 cont./

526 Nordenskiöld did not see the Chiriguano of the Sierra play the game in which the ball is hit with the head, but he did hear it said that formerly they had played this game, called "bondi" by them, and that, like the Chané, they had used solid rubber balls (153). In my work published in this

526
171

153. Nord. 2, p. 104.

journal (154), I have already mentioned that, according to the

[113] 154. Revista de la Sociedad Cientifica del Paraguay, Vol. III, No. 6, pp. 116 and 117.

Litterae Annuae of 1589 (155), the game with a ball hit with

155. Page 434. According to Nordenskiöld.

the head was also played by the Itatines-Guarayús and undoubtedly with a hollow rubber ball, because it is described there as being very light. In 1791 Eder (156) mentions this game

[113] 156. Eder, Franc. Xav.: Descriptio provinciae Moxitarum /Description of the province of the Mojo/, 1791, p. 41. Cited in Nordenskiöld.

with a ball hit with the head for the Moxos /Mojo/, who not only used white, hollow rubber balls, but also used dark, solid ones. Several authors, older ones, and more recent ones, for example, Fernandez and de Orbigny, mention this game among the Chiquito (157). Nordenskiöld on his travels saw it

157. Nord. 2, p. 104.

played in addition to the Chané, by the Huari (158).

158. Nord. 2, p. 104.

C
Ce /35 cont./
526
174
177

According to these data concerning the region of spread of the game with a ball hit with the head, we must assume that the Chané, even before their subjugation by the Chiriguano, must have known this game, and that the Chiriguano of /36/ the Cordillera, like the Itatines-Guarayús, received it earlier from the Chané. The Chiriguano also play the game with a ball made of maize leaves struck with the hand, which we know from many other South American Indians (159). Ac-

C
526
[171]

159. Nord. 1, p. 168. Métraux 1, p. 44 and Fig. 11.

cording to Métraux, this game is not played except at the time when the maize is ripening, and it is related to the cultivation of maize.

With respect to other games of movement, the Chiriguano children play a game which corresponds to the game of polo and is very common among the Chaco tribes. The Chiriguano call it "taca." The ball is struck either, as among the Chorote and the Churupí, with curved sticks or with a primitive racket (160). No doubt the Chiriguano received this game

C
[171]
C
[177]

160. See Nord. 1, p. 193.

from neighboring Chaco tribes.

Of the games of skill, only one is played by adults and this only by women. It is a kind of bowling game that the Chiriguano in Tihuipa call "itarapóa" and the Chané of the Parapití "tecoróre" (161). The bowling pins in this game

Ce
[526]

161. According to Nord. 1, p. 192.

consist of two rows of maize kernels, two by two, one on top of the other, or on a cob. They throw with stone balls or with a hollow ball of baked clay with little pellets of the same material inside (162).

162. Nord. 1, p. 192 and Fig. 99.

/36 cont./

Ce 857 524

Three other games of skill described by Nordenskiöld are played only by children (163). For one of these, called

163. Nord. 1, pp. 196 and 197.

"sóuki," they use two arrows fitted with maize cobs (164).

164. Nord. 1, Fig. 102.

These two games are played by the children of the Chané of the Parapití.

C 857 524

Nordenskiöld saw the third game, called "parama," played by the children of the Chiriguano in the Caipipendi valley (165).

165. Nord. 1, Fig. 103.

With small round stones, propelled with pieces of baked clay, they try to knock down a button, or some such thing, from a rock.

C 524 126

I obtained from the Chiriguano in Machareti some children's toys which belong to these games of skill.

Toys in the Collection

/37 cont./

These Indians received two games of chance from the whites, the game of dice, which they call by the Spanish name "daro," and the game with a cow's leg bone, which they call "taba."

Agriculture

C
Ce
241

I have already explained in the chapter on food and drink that the cultivation of maize as an agricultural product is common, and among the Chané of the Parapití the cultivation of the sweet potato. Mandioca is only cultivated rarely and has no importance in the economy of these Indians. Various species of beans are planted, also one species of cactus, some gourds which have edible fruits, and also a little tobacco. In addition to these edible or stimulating native plants that are cultivated, there are some others received from the whites, but these have little importance in the economy of these Indians. According to Nordenskiöld (171), they are the following: sugar

C
Ce
241
177

171. Nord. 2, pp. 23 and 24.

cane, peanuts, watermelon, muskmelon, figs, oranges and millet, and Métraux also mentions the pepper among them (172).

172. Métraux 1, pp. 338 and 339.

C
Ce
241
[415]
[283]
[386]

In addition to these edible or stimulating plants, there are cultivated various species of gourds whose fruits are not edible but are used to make containers, cotton for making thread, urucú for obtaining red dye, and, among the Indians of the Parapití, also a species of cane, Harundo Donax /Arundo donax/, which grows wild in great quantity on the banks of the Pilcomayo, but not on those of the Parapití River.

/37 cont./

C
Ce
241

The sort of agriculture which these Indians commonly practice is that which we can define with the term "el rozado" /the clearing/, which best corresponds to the technical German word "Waldrodung," which is used for this concept. A piece of woodland is cleared, and the land cultivated in this manner is planted as many times as possible until it is exhausted. According to Métraux (173), the place intended

C
Ce
[412]

173. Métraux 1, p. 334.

for planting is first cleared of underbrush, which is cut with a large stick edged on both sides, and this is burned on the site. Métraux /38/ has also compiled from the literature the respective statements on the method of planting maize (174).

174. Métraux 1, p. 337.

C
Ce
[412]
[177]

Almost all the implements used for this cultivation, such as spades and iron hoes, have been obtained from the whites. The wooden spade, which the Chiriguano doubtless received from the culture of the ancient Peruvians and which was formerly universally used by them, is very rare today (175).

C
412
[177]

175. Nord. 1, p. 188. Métraux 1, pp. 335 and 336.

According to Nordenskiöld, these spades were made of a hard wood and had an artificially formed handle. Two such spade handles with a special handhold at the upper end are shown in drawings by Nordenskiöld and two similar ones by Métraux (176).

176. Nord. 1, Fig. 89. Métraux 1, p. 336, Figs. 3 and 4.

Ce
412
773

In the Chané legends written down by Nordenskiöld, there is also mentioned, in addition to the spade, the wooden punch, which is a very common agricultural implement among most

/38 cont./

Ce 412 773

of the Indians of South America who have agriculture. In one of these legends it is said that (177) Tunpa, after having

177. Nord. 1, p. 260.

created the grandparents of the Avás (Chiriguano) and Chané, gave them a wooden spade and a long carved stick, called "carumpa," and bows and arrows so that they might feed themselves with these implements. In the other legend it is told that the jaguar goes to get the punches when the fox wants to help him plant his field (178). From the indications

C 412

178. Nord. 1, p. 289.

by Métraux mentioned in the foregoing, it follows that the Chiriguano still use such an implement in their agriculture.

C Ce 241 73

The Chiriguano in Machareti had some plantings near their town, but, because of the extraordinary drought at that time, these had produced nothing. The Izozó near Toledo had cleared large areas, but were unable to plant for the same reason. According to Nordenskiöld (179), the large

C Ce 241

179. Nord. 1, p. 183.

plantings of the Chiriguano and the Chané are often far from their towns and are enclosed by thickets.

The Raising of Livestock

C Ce 231

Of the domestic animals native to South America, the Chiriguano and the Chané have the South American dog, which today is mixed with the blood of European dogs (180).

180. Nord. 1, p. 187. Nord. 2, p. 49.

/38 cont./

Because the ancient Peruvians raised various breeds of dogs, we can assume that the Chiriguano received the dog as a domestic animal from the ancient Peruvians. We can assume the same with regard to the duck, which was also raised by the ancient Peruvians. Therefore I do not include the duck among the domestic animals that these Indians received from the whites, as Nordenskiöld does. We do not know whether the Chiriguano in times past might have raised the llama. From the fact that guanacos exist in the territory located between the Parapití and the Rio Grande, we can deduce that the raising of that other species of Euchenia might have been possible in that country.

The Chiriguano very early received such European domestic animals as the horse, the ass, the cow, sheep, goats, hogs, and chickens, which they captured in great quantities in their continual raids on the Spanish settlers. In 16th century documents there are repeated complaints about the extensive stealing of livestock by these Indians. Today the Chiriguano and Chané do not have many horses, and they have never had the /39/ pronounced character of a nation of horsemen. The true weapons of war were formerly a long bow and arrows which were also long, which cannot be used by a mounted horseman, in addition to which their homes were formerly in the hills in regions which the Spaniards could not enter on horseback. In certain parts of their territory the raising of cattle has some importance (181). More general is the raising of sheep, pigs,

181. See Métraux I, p. 340.

and chickens. Today one sometimes also finds among them guinea hens and turkeys (182).

182. Nord. 1, p. 137.

/39 cont./

C Ce 231 Tamed wild animals are rarely found inside their houses, except that they do have some parrots (182) /see footnote 182 above/.

Hunting

C Ce 224 [433] [411] [439] We have explained before that, because of the lack of animals that can be eaten in the territory of the Chiriguano and Chané, hunting is secondary among their means of subsistence, and in accordance with this we know through old documents that the feathers for their arrows were introduced to the Chiriguano by other Indian tribes who were their tributaries (183). The raising of domestic livestock gives them a

C Ce [231]

183. Moreno II, 121.

C 224 greater opportunity to obtain animal foodstuffs. In accordance with the fact that the Chiriguano, at least today, are not first-class hunters, the most common method of hunting among them is the use of traps (184). Nordenskiöld describes three

C 223

184. V. Rosen, op. cit., p. 205.

different kinds of traps, all three of which are used for catching birds (185). The first kind consists of a simple noose and is used

185. Nord. 2, pp. 32, 33, and 85, Fig. 10, 12, and 13.

C [171] with the help of calls. The second kind, which is common among various other tribes of Indians, is used, for example, also by the Kaingua /Caingua/. The third kind consists of a net made in two parts and fixed to the ground by means of stakes. In one of the Chané legends recorded by Nordenskiöld, a trap for catching doves is mentioned (186).

Ce [173] [223]

/39 cont./

Bows and arrows are only incidentally used for hunting, and it is therefore difficult to collect them today among these Indians. From the Izozó I was able to acquire various bows and arrows, and from the Chiriguano a small bow for children and various arrows. Among these there are also two specimens for killing birds, provided with a club /maza/ at the tip. Because in particular cases we were often unable to decide if a type of arrow were used exclusively for hunting or for fishing or both, I shall list all the types of arrows together in the following list.

C Ce 411 174 175

Of the seven Izozó bows, the first four on the list are good specimens made of hard wood and correspond in all details to the Chiriguano bows described by v. Rosen (187), except for

187. v. Rosen, op. cit., pp. 206, 208.

their length, which is a few centimeters less than these. This difference in length is easily explained by the fact these Chiriguano bows were collected by v. Rosen in 1901 and 1902. It would be difficult today to find still among the Chiriguano bows as long as those which v. Rosen acquired 35 years ago. From Lizarraga's statement that the Chiriguano bows were of the same height as the bowman, it is evident that the bows of these Indians were formerly even longer than those described by v. Rosen. If, following Lehmann-Nitsche's somatic measurements mentioned above, we set the average height of Chiriguano men at 1.63 m., there is still a difference of 18 cm. between this figure and that of 1.45 m., which is the length of the longest bow among those collected by v. Rosen. We must consider this shortening of the Chiriguano and Chané bow,

C [141]

Chane SF8
Izozo

C
Ce
411
174
175
Ce
411

/40 cont./

steadily progressing, a consequence of its degeneration resulting from its gradually falling into disuse.

The form of all the bows collected among the Izozó is the same, discounting the insignificant differences with regard to their length. The wood of the bow, which is approximately 3 cm. wide, is flat on the side towards the string and convex on the opposite side. To better fasten the bowstring, each of them is provided at its ends with a quite marked narrowing and always considerably shorter at the upper end than at the lower end. /41/ Three of these Izozó bows show, when not flexed, the reflex form already mentioned by v. Rosen with respect to the Chiriguano bows. The bowstring, made of twisted strips of animal hide, is fastened in the common manner used by South American Indians. By means of a noose with a knot, it goes around the narrowing of the upper end of the bow, while the loop at the lower end is made so that it can either shorten or lengthen the bowstring as necessary. Cf. Fig. 37, a and b /see p. 90/. In all these bows a large part of the string is rolled up as a reserve around the wood of the bow. Bow I. A. 757, whose wood shows cracks on the side toward the string, has wood reinforcements in two places, one of them consisting of a wrapping with thread and the other a piece of the skin of a cow's tail, which has been slipped like a sleeve over the wood of the bow. Cf. Figure 37 /see p. 90/.

Ce
411
283
[237]
[284]
Ce
[237]

The three bows I. A. 758-760, made of light-colored wood, correspond in form to the others, but they are poorly made and appear to be cheap merchandise for trading. Bow I. A. 760 even has a cable wire in place of a string.

Ce
411

The small Chiriguano bow I. A. 518 is a bow made for children for shooting light arrows with a wire point, which have been enumerated in great number in the above list.

C
411
524

The length of the arrows I collected among the Chiriguano and Izozó is somewhat behind with respect to the length of the corresponding bows. The longest among them is a Chiriguano arrow for shooting birds, fitted with a club rather than a point, with a length of 1.11 m. Among the arrows fitted with iron

C
Ce
411
[223]

/41 cont./

C Ce 411 points, one Izozó specimen reaches a length of 1.07 m., and a Chiriguano specimen, a length of 1 m. This is the opposite of the observations that v. Rosen made about Chiriguano arrows, that they were as large or even larger than the bows.

C Ce [524] Without counting the Chiriguano arrows fitted with wire points, which no doubt are used only by children for shooting at fish or birds and which are often made with wooden shafts, Ce [249] [824] arrow shafts are universally made of cane, taken from the plant Arundo donax, which, as I have already mentioned above, is cultivated by the Chané of the Parapití River. Ce 411 [824] According to Nordenskiöld, the Chané formerly also used the Ubá (Cymnerium sp.), which they call "chochio" (188). The

188. Nord. 2, p. 26.

arrows collected among the Izozó are provided with iron points. Nordenskiöld also shows in drawings Chané arrows fitted with wooden points in the form of a lancet or dentate (189).

189. Nord. 2, Fig. 6. A and C.

C Ce 411 Among the Chiriguano arrows in the collection, there are two fitted with iron points, one fitted with a dentate wooden point, one such wooden point without a shaft, and two arrows for bird hunting that are fitted with a club instead of a point. The Chiriguano arrows fitted with iron points correspond throughout to the Izozó ones with respect to form and material. Ce [284] The iron point is joined to the shaft by means of a piece of split wood and a wrapping of cord made from special tree bark and fastened with wax. The lower end of the cane shaft has a groove over which the end of the arrow is also fastened by a wrapping of the same cord secured with wax.

Ce 411 237 /42/ Some Chiriguano and Izozó arrows have feathering, others do not. While the feathering was lost on some of the arrows that do not have it now, as can be discerned from the remnants of wax which had served for attaching it, other arrows show clearly that they never had feathering. Ce [284] [191] If there is feathering, the feather parts attached by means of wrapping with cord are very small, as are those of most of the Chaco tribes.

/42 cont./

000 C Ce 411 237 C 411 [284]

and wax are small, as are those of most of the Chaco tribes. In the diagram made by Hermann Meyer for the various types of South American arrows, the feathering of the Chiriguano and Chané arrows corresponds to those that this writer calls "Peruanische Pechfiederung" /Peruvian pitch-feathering/. The Chiriguano arrow provided with a dentate wooden point differs from the other arrows in that its point is attached directly to the shaft without interposing a special piece of wood. Otherwise, the form of its shaft, provided in this case with feathering, corresponds to the form of the arrow shafts fitted with iron points. V. Rosen (190), v. Nordenskiöld (191), and

190. V. Rosen, op. cit., Figs. 206-214.

191. Nord. 2, Fig. 6 B.

Métraux (192) show in drawings different types of Chiriguano

192. Métraux I, Plates 8 and 9.

arrows fitted with wooden points.

Métraux often found among the Chiriguano in the Caipipendi valley arrows fitted with two dentate wooden points, which the young men used especially for shooting jacus (193).

193. Métraux I, p. 347 and Plate IX, N. 1.

Of the two Chiriguano bird-hunting arrows fitted with a club at the upper end instead of a point (sõngo), only one specimen, I. A. 534, can be considered typical. As I have already mentioned, it is the longest arrow in the collection. The other arrow for hunting birds, much shorter and badly made, doubtless was used only by boys. The form of the clubs of these two arrows (cf. Fig. 37e) is the same and also corresponds to the form of the arrows of this kind shown in

C 411 /42 cont./
drawings by v. Rosen and v. Nordenskiöld (194). This club is

C 411 284 194. V. Rosen, op. cit., Fig. 212. Nord. 7. Fig. 6. D and E.

fastened directly on the inside of the upper part of the shaft. The shaft of the larger arrow is made of the same cane as that of the other arrows, and that of the smaller arrow is light wood. The binding on the upper part and also on the lower part of
C [239] the shaft of the longer arrow consists of cotton thread secured with wax. The two arrows have feathering and have the same groove at the bottom end of the shaft. Several specimens of Chiriguano bird-hunting arrows whose clubs show different forms are shown in drawings by Métraux (195).

195. Métraux I. Plates X-XI.

C 411 174 [283] The special form of the club of the arrows for shooting birds (cf. Fig. 37e) and the special method of binding the shaft with a cord of tree bark and the length which these arrows formerly had lead us to the conclusion that this type of arrow, equally common today among the Chiriguano and Chané, is the ancient form of arrow that the Chiriguano brought from their native soil to the west. I have already mentioned that the Chiriguano and Chané bows and arrows were formerly much longer. But we can also assume that these implements of the hunt and weapons of war, in accordance with their greater importance, were formerly better made than they are today.

C 411 524 According to Nordenskiöld, only rarely does the podoque, the bow for shooting balls, appear among the Chiriguano and Chané, and it is only used by youths and boys (196).

196. Nord. 7, p. 26.

/-2/

Macana in the Collection

411 [126] I. A. 517. (Chiriguano.) Length 64 cm. (Fig. 38).

[191] The wooden macana, acquired from the Chiriguano, is provided at its upper end with a broadening distinctly delimited from the handle (cf. Fig. 38) and in that respect corresponds to the macanas that we know from various Chaco tribes, for example, the Toba, but it does not correspond to the Chiriguano macana shown in a drawing by Nordenskiöld (197).

197. Nord. 7. Fig. 9.

The latter is about the same length, but it does not show the clear broadening at the handle, its upper end being only slightly broader. According to Nordenskiöld, the Chiriguano [224] do not use these macanas except for hunting pigs (198).

198. Nord. 1, p. 163.

Slings (tamombeka) in the Collection

[126]

I. A. 508 Chiriguano. Length of the middle part of net 15 cm.
I. A. 509. " " " " " " 14 cm. (Fig. 50.)

The two slings acquired from the Chiriguano seem to be exactly alike. They consist of a middle part made with the [286] net technique with caraguata-fiber string which terminates at each end with a cord. One of these two cords ends in a simple [284] knot and the other in a small loop. These slings are like the Chané ones shown in drawings by Nordenskiöld, while the manufacture of the middle part of the Chiriguano sling shown by Nordenskiöld is different (199). The Chiriguano in contact

199. Nord. 9, Fig. 7, A.

C 411 (77) /43 cont./ The Chiriguano in contact with the Quichua /Quechua/ also use another type of sling made of wool (700).

700. Métraux 1. p. 347 and Plate VII.

C 224 (311) According to Nordenskiöld,[1] the Chiriguano also formerly used the bola, called "*chuzing*," by them, for hunting the ostrich (701).

701. Nord. 1. p. 183.

C (231) We must still mention that the Chiriguano train their dogs for hunting, especially for hunting pigs (702).

702. Nord. 2. p. 31. Métraux 1. p. 346.

Fishing

C 433 282 226 Because, as I have already mentioned, there is no opportunity for fishing in any part of the Chiriguano territory and also the large rivers which are in their territory, except for the upper Pilcomayo River, do not offer any fish other than very small ones, fishing has only secondary importance in the economy of most of the Chiriguano, although they utilize every chance they have to fish.

C 227 Among the Chiriguano in Macharetí I did not see any fishing equipment outside of the small arrows with wire points, which are occasionally used for fishing. But among the Izoceño I acquired such a piece of equipment, which consists of a net bag that is closed at the top with two sticks of cane attached to the upper edge. (Cf. Figure 39.)

CS 136 227

Ce 227 126 /4/

Fishing Implements in the Collection

I. A. 764. Fishing implement (Izozó). Length of the sticks 73.5 cm. Width of the net 24 cm. (Fig. 39).

I. A. 765-801. Net bags for implements like I. A. 764 (Izozó).

Ce 227 Because of the flexibility of the two cane sticks attached to the upper edge of the net bag, the bag can be made to open by tension on the two sticks of cane. The opening thus made closes quickly when the tension ends. Such an implement of the Chiriguano of the Parapití is shown in a drawing by Nordenskiöld (203).

203. Nord. 1, Fig. 91.

Ce 226 Among the other methods of fishing I shall mention, following v. Rosen and v. Nordenskiöld, the following: First, fishing by means of a gourd placed on the bottom of the river in the shade of a branch which is attached to the bottom near it. When the fish attracted by acidified maize have gathered inside the gourd, its opening is quickly closed with the hand (204). In addition the Indians of the Itiyuru River make

204. Nord. 1, p. 194 and Fig. 90.

oblong pools by building dikes (205), and those of the upper

205. Nord. 1, p. 185.

Pilcomayo River build large stone dikes for fishing (206). It

206. Nord. 2, pp. 43 and 44.

is said that on this river they use the bark of a particular tree to poison the water (207). They also fish with hooks, which

207. Nord. 2, p. 40.

C
Ce
226
[439]
[171]

/44 cont./The also fish with hooks, which today they obtain from the whites. But it may be that the hook is an implement of their ancient culture (208). In

208. Nord. 2, p. 44.

addition, they fish by means of deep nets like those of the neighboring Chaco tribes, such as the Chorote, the Churupí, the Matako, and the Toba (209). They also fish with arrows

209. Nord. 2, p. 43. Métraux I, p. 350, Fig. 80.

and formerly with spears with two points. On his trip in 1901-1902, v. Rosen acquired one specimen of these spears from the Chiriguano, which he has described and shown in a sketch (210).

210. V. Rosen, op. cit., p. 214 and Fig. 216.

C
Ce
227
411

Among the Chiriguano and Chané arrows specifically for fishing, we must distinguish two different kinds, one for larger fish, with two dentate wooden points (211), and the other for

211. Nord. 2, Fig. 15b. V. Rosen, op. cit., Figs. 213 and 214.

small fish, provided at the upper end of the shaft with a large number of cactus spines (212).

212. Nord. 2, Fig. 15a.

/44 cont./

175 316 648 [169] Acquisition of Raw Material of Inorganic Origin

Because it was the rich treasures of the Incas and of the bordering lands, especially their wealth in gold and silver, which stimulated the Chiriguano to immigrate into the regions bordering this empire, the question is posed as to whether the Chiriguano took part in the exploitation of the land for that purpose. We know of their battles with Guacane and his brother Condori because of the rich mines of Maypurún, and we know that the Chiriguano possessed these mines for some time and that on this occasion they took great quantities of gold and silver. But in those battles they captured Condori in person, and he was the owner of the mines, and they kept him no doubt to work the mines for them. Furthermore, their power over the region of the mines lasted a short time, because they were thrown back by the cacique Grigota /45/ as far as the eastern spurs of the Andes. We have no information that in their new land they had any opportunity to extract gold and silver from the earth, or that they themselves ever worked these metals in any major way. Today they have their silver ornaments made by the mestizos or the whites of their region, except for the single fact that the Chiriguano sometimes made their tembetás of tin.

301 177 439

316 Through the description of their tembetás and necklaces, we know that the Chiriguano have some semiprecious stones. As Nordenskiöld relates (213), they, according to their own

213. Nord. 1, p. 209.

statements, find the turquoise and chrysocolla beads on the ground where there had been houses or where ancient tombs are located.

263 317 [439] While salt today is obtained from the whites, it was formerly extracted from the land, either in the form of rock salt, which they got from mines near San Luis, or in the form of salt water which they obtained by treating with water

C
317
263

/45 cont./
the earth of the salt licks called "yukiu" (214).

214. Nord. 1, p. 189. See Métraux 1, pp. 359 and 360.

Making Fire

C
Ce
372

Native implements to make fire are little used today by the Chiriguano and Chané. At home fire can generally be obtained from some other piece of burning wood, and for other occasions they commonly provide themselves with modern matches. Moreover, as I have said, the Chiriguano and Chané are not great smokers. One fire-making tool which is still found among them is the strike-a-light. The specimen I acquired from the Chiriguano is different from the strike-a-light of the Chaco tribes in that the tinder consists of a quite thick cotton wick. According to Métraux (215),

C
Ce
[178]
[276]

C
Ce
[415]
[237]

215. Métraux 1, p. 253.

there is also found among them the common form of strike-a-light in which the tinder consists of the fuzz of the fruit of the palo borracho (Chorisia insignis) kept in a container made of a a cow horn or armadillo tail.

Ce
372
773

In a Chané legend recorded by Nordenskiöld (216), it

216. Nord. 1, p. 252.

turns out that the Chané formerly produced fire by rubbing one little stick upon another. According to this legend, two boys and a girl received fire from an old man, who is the sun. The bird Huapi advised them to take good care of the fire. Should it once go out, they would have to make new fire with the "tata," which is the /46/ implement for making fire by rubbing two sticks together. The cacique of the Izozó, when I asked him about this implement, also knew it well and called it by its name in Guaraní. Nordenskiöld once saw a Chiriguano who had no matches with him make a fire with such an implement (217).

Ceramics

C
Ce
445
114

The great development of ceramics among the Chiriguano and Chané, the very great variety of forms of their diverse vessels and their ornamentation have long excited the interest of ethnologists. Nordenskiöld, who gives the number of variations in the forms of the vessels of these Indians as more than 50, has published a great many of them in outline and also presents the ornamentation of many of them in sketches (218). Eric v. Rosen has also shown numerous

218. Nord. 1, Figs. 77; 78; 82; 92; 113; 117; 121, and Plate 19. Nord. 2, Figs. 38-48.

C
415
114

/46 cont./ Eric V. Rosen has also shown numerous Chiriguano vessels in drawings in his work already cited (219).

219. V. Rosen. Figs. 218-225.

Métraux describes and shows by drawings a great number of Chiriguano baked clay vessels (220).

220. Métraux 1, pp. 370-374; pp. 382-428; Plates 16-19 and 24-60.

A publication by Felix F. Outes deals particularly with Chiriguano ceramics (221).

C
[113]

221. Felix F. Outes: La ceramica Chiriguana /Chiriguano Ceramics/." From the Revista del Museo de la Plata, Vol. XVI (second series, Vol. III), Buenos Aires, 1909, pp. 121-136.

C
Ce
126
415

Because formerly in the museum of the Sociedad Cientifica del Paraguay we had only four baked clay vessels and a piece of a handle from the Chiriguano, which Doña Maria F. de Casati collected among them and presented to the museum, I had a special interest in filling this gap. With some effort I managed to acquire from the Izozó in Toledo 41 Chiriguano vessels, and from the Chiriguano in Machareti, 55 of them, and with rather more effort I managed to bring them back whole and with their designs in good condition through the long trip to Asunción.

These baked clay vessels collected by me also show great variation in their form and ornamentation. But these diverse variations can be reduced to several groups, according to the purpose for which they were intended.

C
Ce
415

The Chiriguano and Chané baked clay vessels may serve very different ends:

1. To cook foods and liquids.
2. To fry /fritar, literally "to frit"/ foods.
3. To steam maize meal.
4. To carry and keep water.

C
Ce
415

/46 cont./

5. As a container for chicha.
6. To serve chicha.
7. As a drinking container, especially for drinking chicha.
8. To store food.
9. To store anything at all.
10. As plates for eating meals.
11. As a base for the spindle in spinning.
12. As funerary urns.

C
415

The form of these ten Chiriguano vessels intended for cooking foods or liquids is essentially the same. Only the vessel I. A. 412, with a height of 12 cm., is substantially smaller than the other vessels, whose height varies between 20 and 30 cm. Only in the case of the former small vessel is the diameter of the aperture at the top equal to the height of the vessel, while for all the other vessels the diameter of the aperture at the top is less than the height, and in some cases this is a difference of up to 10 centimeters.

/47 cont./

000 C 415 531 difference of up to 10 centimeters. The neck is clearly distinguished from the globular belly of these vessels by a border on all of these vessels provided with sunken ornamentation. Also the flat part of the bottom is clearly distinguished from the wall by a border. The surface of the belly of the vessels has incised lines produced by rubbing the surface, when still moist, with a maize cob. Only the little vessel I. A. 412 has its entire surface covered with sunken ornamentation.

C 415 All of these vessels intended for cooking are fitted with two handles in a vertical position, attached to the upper rim of the pot and coming down to the lower part of the neck. The form of these handles shows some variation which I shall deal with in the chapter on art.

Vessel Intended for Cooking Maize Meal for the Preparation of Chicha, from the Collection

C [126] I. A. 399 (Chirig.) Ht. 52cm. Max. dia. 42cm. Aperture 24 cm. (Fig. 50).

Large baked clay vessels, which in many cases are still much larger than the specimen brought back by me from the Chiriguano, are used for cooking the maize meal used in the preparation of chicha. As shown in Fig. 50, this kind of vessel is different from the ordinary vessels intended for cooking only by not having handles. The wall of the belly is clearly C [531] distinguished from the neck and from the flat bottom. The neck of these vessels also has sunken ornamentation. The vessel shown in Figure 50 is relatively high in comparison with its maximum diameter and with the diameter of the Ce [415] aperture at the top. The vessels for cooking chicha native to the Chané on the Itiyuru and shown in drawings by Nordenskiöld have, in comparison with their maximum diameter and the diameter of their aperture, a much smaller aperture /sic/, (222).

2. Vessels Intended for Frying Maize, from the Collection

I. A. 400 (Chirig.). Ht. 14 cm. Max. dia. 33 cm. (Fig. 53a).
I. A. 592 (Izozó). " 10 cm. " " 21.5 cm.

These two vessels are very similar to each other. Both have two small handles on the rim. They differ from one another only in that the division between the flat base and the wall of the Izozó pot is more marked than on the Chiriguano vessel. A vessel very similar to the two described above and from the Chané on the Itiyuru River is shown in a drawing by Erland Nordenskiöld (223). Because Nordenskiöld states that

223. Nord. 2, p. 53 and Fig. 43, N. 23.

this vessel was intended for frying /fritar/ maize, I also consider the two similar vessels in the collection to have been used for that end.

c

[126]

3. Vessel for Steaming Maize Meal, from the Collection

I. A. 422 (Chiriguano). Height 12.5 cm. Max. dia. 23 cm. (Fig. 52.)

This vessel has some round holes in the bottom, one of which is in the center and the rest in two concentric circles around the central one. According to Nordenskiöld (224),

c
415
252

224. Nord. 2, Fig. 43, N. 22.

who shows in a drawing a vessel very similar to this one, these plates with holes in the bottom are used for steaming the maize meal with which they prepare a dish that they call in Chiriguano "huintimimimo." To do this, they put the plate with the maize meal on the aperture at the top of a pot in which they boil water (225).

225. See Métraux I, p. 357 and (Plate 13) N. 1 and 2.

C
Ce
[531]

The vessels mentioned in the above, in contrast with the cooking pots, have a smooth surface. Also they are not painted. This leads us to assume that they are intended for common use rather than for festive occasions, and we must consider them primarily as vessels for water, which naturally does not preclude their being used on occasion for chicha. Plates XIV-XVII appear here.

/49/

C 415 Among the four Chiriguano vessels of this kind, there are three different types. Two of them have a globular form of the belly and the well-marked distinction of the neck and of the flat bottom, like the cooking vessels, but the surface of the neck too, is smooth, and the handles are different. These, in contrast to the others, are placed in a position horizontal to the wall of the belly of the vessel, slightly above the maximum diameter.

The other two Chiriguano vessels of this kind do not have handles, and their aperture at the top, in comparison to the height, is relatively small. Vessel I.A. 353 has a round bottom, with the result that it cannot stand upright on a flat surface. Vessel I.A. 395, besides its very small aperture, has a cylindrical neck, narrow and relatively high, which can easily be encompassed by the hand.

Ce 415 The Izozó vessels for water have an aperture at the top that is relatively quite small. Three of them have a round bottom and hence cannot stand on a flat surface, while the bottoms of the rest are flat. The necks of all of these vessels are very little distinguished and that of vessel I.A. 698 is very short. Ce [531] The surface is smooth and unpainted. Vessels I.A. 761, 762, and 763 are inside a net, which indicates that they are special vessels for carrying water. Vessel I.A. 696 is clearly a vessel for the same purpose on account of an interlacing of thread on its lower part. None of these Izozó water vessels have handles except for two small vessels which are also different in form from the others. They have two handles which come down vertically from the upper rim. They also differ from the other vessels in their relatively large aperture at the top. Vessel I.A. 617 has a leather strap attached to its two handles.

/50 cont./

CC 415

Among the vessels used as receptacles for chicha, those of the Chiriguano generally show different forms from those of the Izozó. The form of these Chiriguano vessels, especially that of the large ones, generally has a globular belly (cf. the figures 368 /see Fig. 55, p.129/, 370 /see Fig. 56, p.129/, and 377 /see Fig. 57, p.129/), while on the vessels of the Izozó the lower part of the belly becomes larger going upward and is commonly distinguished by a border on the upper part which becomes smaller going upward. (Cf. Figs. 61 /see p.129/, 68, and 69 /see p.132/.) The surface of all of these vessels is smooth and, with the exception of a few Izozó vessels, have designs on them. Only the large Chiriguano vessel I. A. 397 has a round bottom; all the other vessels have flat bottoms marked off from the belly by a border.

CC [531]

Among these Chiriguano and Izozó vessels there are some which have their maximum diameter at the aperture on top (cf. Figs. 60 /see p.129/ and 67 /see p.130/), which gives them the shape of a large dish. Vessels I. A. 397 and 398 differ from the rest by their height.

Of these Chiriguano pots, nine have handles and 12 do not. Of the eight Izozó pots, only two have handles. (Cf. Fig. 68a /see p.132/.) Most of these Izozó pots have the peculiarity that the necks, well distinguished by a border, become wider toward the upper rim. (Cf. Figs. 61 /see p.129/ and 69 a and b /see p.132/.)

The Chiriguano and Chané use vessels like those mentioned above in the chicha festivities, taking the chicha from the large pots by means of them and filling the cuyas /gourd vessels/ or baked clay cups that they pass among those present at the fiesta.

Fr Schmidt--125 8-5 (1926) 1928 SF10 Chiriguano SF10
Chané SFE
Izozo

/121/

C Ce 415

Among these vessels we must distinguish two different principal types. The vessels of the first type have the globular form of the belly, a narrowed part at the neck, a relatively small aperture, a flat bottom, and a vertical handle placed on the upper rim and coming down to the upper part of the belly. See Figs. 74 /see p.130/ and 82 /see p.144/. The second type, whose form was no doubt received from the whites, differs from the first primarily in that its aperture has a spout like modern vessels. See Figs. 84 and 85 /see p.150/. Vessels of this type also have a handle that, placed at the upper rim, comes down to the upper part of the belly.

Ce [197]

C 415

In addition to these vessels I found one among the Chiriguano which corresponds in form to vessel I.A. 382, already mentioned among the vessels for carrying water. Like that one, it has a narrow, cylindrical neck that can easily be encompassed by the hand and has no handle. Because its surface has designs, I have included it among the vessels intended for serving chicha.

Ce 415

Among the vessels collected among the Izozó there are four in the shape of cups. From the types of vessels shown in drawings by Nordenskiöld (227), it is learned that similar cups

227. Nord. 2, Fig. 40, N. 28; Fig. 42, N. 22 and 23; Fig. 44, N. 19-21.

Ce [197] Ce

are used by the Chané on the Ituyuro and by the Chiriguano. We must assume that the form of these cups is the result of the influence of European styles. These vessels have a globular

Ce 415 /51 cont./ These vessels have a globular form and are provided with a handle. The bottom of three of them is clearly distinct from the belly, forming a foot. Ce [531] Two of them have designs on the surface; the others are without designs.

C 415 [124]

8. Vessels Used as Receptacles for Food, from the Collection

I. A. 394. Chiriguano. Height 17.5 cm. Aperture 44 cm.
I. A. 401. " " 11.5 cm. " 30 cm.

C [124] Two of the baked clay dishes that I obtained from the Chiriguano in Macharetí seem to me to be too big to be considered as dishes for eating, because Nordenskiöld states that (228) the Chiriguano do not eat from a common dish, but

228. Nord. 1, p. 190.

rather each one has his own separate dish. We can assume that these are vessels used as food containers or serving dishes for food before it is placed on the individual dishes.

C [531] The two dishes are without designs. The flat bottom is well distinguished from the wall, which widens upward. The dish I. A. 401 has a rather wide rim which has two handles. Cf. Fig. 53b /see p. 118/.

9. Vessels Used for Storing Objects

C Ce 415 [171]

In contrast to the other Indians, the Chiriguano and Chané use vessels for keeping anything of value. I did not receive from the Indians any indication /52/ that any of the vessels I brought from them belonged particularly to this type. Therefore I refer here to a vessel shown in a drawing by Nordenskiöld with the caption "For keeping knicknacks in" /cited in English/ (229).

229. Nord. 2, p. 158 and Fig. 45, N. 19.

/52 cont./

Ce
415

Nordenskiöld says in another place that the mistress of the house keeps all the family's valuable things, such as clothing, ornaments, silver plates, turquoise or chrysocolla necklaces, and many other things, in these vessels (230).

[531

Because every Chiriguano and Chanée as already mentioned, eats from his own dish, such baked clay dishes are found in great number in the houses of these Indians. Many of them that are intended for ordinary use do not have designs, while others, used on the occasion of fiestas, have designs on their outer surface or on the upper rim of the interior surface, or are provided with small additions.

/52 cont./

C
Ce
415

All of these dishes have a round belly, becoming somewhat larger going upward. The differences in form are limited only to variations of the upper rim and the bottom. The wall of some of these dishes ends at the top without forming a special rim. Cf. Fig. 76b /see p.143/. Other dishes have a rim in a horizontal or oblique direction. The upper rim of dish I. A. 406 (cf. Fig. 78a /see p.143/) has small continuous incising. The flat bottom of most Izozó dishes is clearly distinct from the wall, forming a foot. This distinction of the bottom is lacking in most Chiriguano dishes, one of which has an almost round bottom.

Ce
415
283

Nordenskiöld (231) shows in drawings two small dishes of

231. Nord. II, p. 165 and Fig. 44, No. 23 and 24.

the Chané of the Parapití River, which, according to his statement, are used in the spinning technique /Plates XVIII-XXI appear here/ /53/ as a base for whirling the spindle on its bottom. The small dish I. A. 619, which I obtained from the Izozó and which differs from the other dishes in the collection principally because of its thick and heavy bottom, is similar, with regard to its form and its dimensions, to those two dishes published by Nordenskiöld, and thus I assume it to be for the same purpose, although I did not obtain any indication from the Indians regarding that.

12. Funerary Urns

764
415

In the chapter on the treatment of illnesses and burial, I have already dealt with the Chiriguano custom of placing their dead inside funerary urns and of closing these with other vessels. According to Nordenskiöld (232), the large baked clay

232. Nord. 1, p. 278.

vessels used for preparing and keeping chicha also serve as funerary urns. Because among those Indians burial in funerary urns is a direct burial, that is, the entire corpse is placed within the urn, the vessels selected for funerary urns must be large enough to have room for the corpse of an adult. Un-
[226] fortunately, I was unable to bring such large vessels from Machareti. The largest of the vessels that I brought, 52 cm. and 62 cm. in height, are not big enough for an adult, and in particular their apertures on top, which measure only up to 24 cm., are too small to be able to squeeze in a dead person. Therefore, with reference to funerary urns and their respective tops, I refer to the drawing made by Nordenskiöld (233). Outes

233. Nord. 1, Fig. 112.

has published a Chiriguano vessel with a height of 27.5 cm. and an aperture on top of 27.5 cm., which had served as a funerary urn for a small child. With the urn was found a small baked clay dish approximately 6 cm. high (234).

234. Felix F. Outes, op. cit., p. 135 and Figs. 30 and 31.

Outes' data show that the vessels of the Chiriguano can reach quite large dimensions (235). Among the vessels

235. Felix F. Outes, op. cit., pp. 127 and 128.

Chaco SF8
28420

C
764
415

/53 cont./

described by him there is one which is 95 cm. high and has an aperture at the top 70 cm. in diameter. Another is 110 cm. high and its maximum diameter measures 65 cm. In 1845, in Capirendá, Wedell found such vessels with a height of 120 cm. and a maximum diameter of 100 cm. for the wall of the belly.

C
415
177

We have no evidence regarding the purpose of these four vessels which are different in form from the other types of vessels. We must regard the small, double vessel I. A. 411 (cf. Fig. 81a /see p.144/) as a special result of the mixture of various, but different cultural elements. The way in which the two small dishes are joined to form a double vessel /34/ corresponds to ancient Peruvian models, while the form of the handle, fitted with a ring, is doubtless an addition of European origin. The whole has the form of a salt cellar and was perhaps made to be sold to the whites for this purpose. We must also consider the vessel I. A. 410 (cf. Fig. 81b /see p. 4-/) as merchandise, while the two vessels I. A. 397 and 399 seem to be manufactured for some use in festivities.

Ee
[439]

Baked Clay Spindle Whorls

C
Q
283
323

The spindle whorls collected among the Chiriguano and Isoso are of baked clay or wood, and the Chiriguano also have some spindles with stone whorls. Because I shall deal with spindle whorls in the chapter on spinning, I wish only to

/54 cont./

point out here a difference between the baked clay whorls of the Izozó and those of the Chiriguano with regard to their manufacture. The whorls of the latter are made of pieces of clay from any broken vessel, by filing them round and perforating them in the center, while the whorls of the Izozó consist of a small disk with different variations in form, also perforated in the center, but made of baked clay especially for that purpose.

Concerning the pottery technique of the Chiriguano and the Chané, we are well instructed by the data given by Nordenskiöld, S. Linné, Métraux (236), and Campana (237).

236. Nord. 1, pp. 244 and 245. S. Linné: The Technique of South American Ceramics, Göteborg, 1925. Métraux 1, pp. 382-388.

237. Campana (Doménico del), "Notizie intorno ai Ciriguani /Information concerning the Chiriguano/," Archiv per l'antropologia e la etnologia, Florence, Vol. 32 (1902), p. 382.

Especially noteworthy among these is the description of the manufacture of baked clay vessels by the Chané on the Bijuru River, which Nordenskiöld studied in its entire procedure. In the book written by Linné, entitled The Technique of South American Ceramics, we find, in addition to the systematic arrangement of the observations made by Nordenskiöld among the Chiriguano and Chané, important data on the results of chemical analyses and microscopic observations which Linné made on the vessels of these Indians. According to this information, the procedure for manufacturing these vessels is the following:

The first condition for the manufacture of baked clay vessels is the availability of suitable clay which has sufficient plasticity so that the vessel can be modeled and fired without being broken. Only a clay with special qualities can meet

C
Ce
323

/54 cont./

these two requirements. Generally it is necessary to correct the defects of the available clay, fixing it by the addition of other substances. Thus the Chiriguano and Chané add to the clay pieces of crushed baked clay. The Chiriguano women in Tarapayu like to use as such an additive, which they call "takupe," pieces of baked clay of ancient origin which they find in great number in their territory and which substance also contains, according to microscopic investigation, pieces of baked clay added to the clay (238).

C
Ce
[113]

238. S. Linné, op. cit., p. 36, Fig. 2, and p. 70. Nordenskiöld, Erland: Forskningar och äventyr i Sydamerika /Research and Adventure in South America/, Stockholm, 1915, p. 34. Nord. 1, p. 284.

From the quality of the substance of a baked clay vessel of the Chané of the Parapití which is in the Göteborg museum, it turns out that these Indians also add sand to the clay, in addition to pieces of crushed baked clay (239). By microscopic

C
114
323

239. S. Linné, op. cit., p. 33.

analyses of sections of vessels, Linné was able to demonstrate /55/ that pieces of baked clay were added to the clay of the Chiriguano. As a result of these analyses, he points out the following: "Microscopic section analysis of Chiriguano ceramics have shown the materials to contain, besides small quartz grains and larger grains of other minerals, particles of the same colour as the ground-mass, but with distinct outlines. These are due to ground potsherds. There are also some very dark particles, as well as lighter ones, and they, too, are potsherds. The variation as to colour is due to the vessels often in the firing, becoming quite differently coloured in their outer and inner layers" /cited in English/ (240).

240. S. Linné, op. cit., pp. 37 and 68.

/55 cont./

Ce 323 [114] According to Nordenskiöld's observations among the Chané in Itiyuru, the clay to be used for the manufacture of a vessel was first crushed and then mixed with pieces of baked clay also crushed. We do not know how the clay thus prepared is transmuted by the addition of water into the needed plastic substance. [Ce 171] The construction of the vessel is done in the manner most common among South American Indians. First a disk with a raised rim is formed from the clay prepared in the manner described, and this is placed on a piece of cloth or a board. The wall is built on this part, which forms the base of the vessel, by means of rolls of clay which in the form of rings, are placed on top of one another (241). Stones and

241. Nord. 1, p. 244. Nord. 2, p. 137.
S. Linné, op. cit., p. 78. Métraux I, pp. 373 and 384.

narrow little sticks of cane are used to smooth the surface of the vessel made in the manner described. These are also used as a gauge to obtain the proper proportions. [Ce 824] To rub the surface of the vessels intended for cooking and that of the larger vessels, a maize cob is commonly used, which makes sunken parallel lines so that the surface of those vessels is less smooth(242).

242. Nord. 1, p. 244. Nord. 2, p. 137.
S. Linné, op. cit., pp. 107 and 108.
Métraux I, p. 384.

C 323 Using the method described in the above, the Chiriguano manage to make excellent, solid vessels which show a well-proportioned form of wall. According to measurements made by Linné, the radial difference of the aperture of the Chiriguano vessels, whose apertures on top have a diameter of from 15 to 20 cm., is less than 1 mm. (243).

243. Linné, op. cit., p. 78.

/55 cont./

323 Data on the thickness of Chiriguano vessels have been given by Oates in his publication which we have mentioned. According to him, "the walls of the vessels, in general, do not show great thickness: in those of larger size, they are from 15 to 20 millimeters: in the medium ones, they do not exceed 8 millimeters: in the small ventricose jars, they vary between 7 and 4 millimeters. As an exception to these, Oates mentions a small vessel with a height of approximately 6 centimeters and a maximum diameter of 12 centimeters, which is relatively thick, since its side walls are from 7 to 9 millimeters and the bottom reaches 15 millimeters (264).

264. Oates, op. cit., p. 128.

323 531 A large part of the vessels are provided, even before being baked, with handles or with different kinds of decoration on their surface. The surface of the neck of the vessels intended for cooking is decorated with sunken ornamentation by impressions made with the finger. Rings of clay are put on the surface of some vessels, as is shown by the piece of baked clay from a Chané vessel shown in a drawing by Lizné (265), or the surface

265. Lizné, Fig. 21. Nord. 1, p. 265.

is provided with small additions. Cf. the vessel shown in Fig. 44 /see p. 116/. The finer vessels are painted before the firing. The designs are applied in white, red, dark brown, and black (266).

266. Nord. 1, p. 266.

The white color in general is the background color, on top of which are applied /56/ the other colors. For that tiny brushes made of agouti hair or of feathers held together with wax are used (267). The white color is an earth paint (kaolin), the red,

413 1341 ovo

267. Métraux 1, p. 265.

C 326 323 531

/36 cont./The white color is an earth pigment, the red, dark brown, and black are pulverized mineral substances of the corresponding colors (348). Métraux has published the results

348. Nord. 2. p. 145.

of chemical analyses and petrographic observations which he made on these mineral colors (349).

349. Métraux 1. 305.

According to Nordenskiöld, the Chiriguano at times paint their vessels with a paint consisting of a mixture of urucú and oil, which is probably applied after the vessel has been baked (350).

350. Nord. 2. p. 145.

C 323

Before the vessel is baked, it must be quite dry. In the case observed by Nordenskiöld among the Chané on the Itiyuro River, the vessel was dried for a day in the shade, which can be done, according to another note by Nordenskiöld, in the sun as well (351). The baking is done, according to Nordenskiöld's

351. 2. Lizot. op. cit., p. 121.

observations, by piling firewood, maize cobs, and dry cow dung around the vessel. This fuel must burn with a strong fire for a quarter of an hour and, if the vessel is large, even longer (352).

352. Nord. 1. p. 341. Cf. Nord., Fig. 171.

C 323 [324]

Some of the Chiriguano vessels are varnished. According to Nordenskiöld, such vessels are common among the Chiriguano and Chané on the Itiyuro River. They cover them with the resin of a Mimosaceae, which the Chiriguano call "yaravirati." When varnished in this way the vessels acquire a yellowish sheen. Only the vessels of the Chané on the Itiyuro sometimes show black

C 323 324 326

Ce /36 cont./
323 point on the rim, which is done with the resin of the palo santo
324 (Bulnesia sarmientii), which is spread over the surface of the
326 vessel after it has been baked (253).

253. Steed. 1. p. 366. Steed. 2, p. 144.
Métraux 1. pp. 388 and 397.

Ee
324

Working of Stone and Metals

The manufacture of stone implements is not done among the Chiriguano and Chané. The same can be said with respect to the manufacture of metal implements, except that the Chiriguano sometimes make their needles of tin themselves (254), while

Cb
325
326
439
197
41

254. Steed. 2. p. 171.

they ordinarily obtain their metal ornaments and implements from the mestizos and the whites.

C
322
[41]

Woodworking

Various objects made out of wood by the Chiriguano have already been mentioned above, such as house posts, ladders, plows, spoons, pipes, bows, arrow points, and also cuyas /vessels made out of gourds/ and calabashes. Among other objects made of wood we must also mention the mortar and pestle, various implements used in weaving, small sticks for making nets, large dishes used for keeping food, and flutes. Because the Chiriguano, when they work wood today, exclusively use modern tools obtained from the whites, they have not retained any of their native technique. /Plates XXII-XXV appear here./

Grinding the Raw Materials

C
Ce
252
412

For grinding raw materials, principally for grinding corn, the Chiriguano and Chané use large wooden mortars with long pestles (255). Such a wooden mortar is shown in Figure 15 and

255. Nord. 1, p. 51. Métraux I, p. 365. Fig. 30.

C
Ce
412
[171]

another one by Nordenskiöld (256). Stone mills are not used by

256. Nord. 1, Fig. 116.

these Indians, although this implement was used, except for the Chaco tribes, by all the tribes whom the Chiriguano had as neighbors after their migration to the west. According to Métraux, a small stone mill is used only for grinding the seeds of a plant which the Chiriguano use as soap for washing their hair. Such a stone mill is shown in a drawing by Métraux (257).

C
[515]
[388]

257. Métraux I, p. 467, Fig. 122.

C
412
171
174

Because the wooden mortar is common even today among the Kainguá /Caingua/, who also belong to the Guaraní linguistic group, and is also mentioned for the ancient Tupinambá /Tupinamba/ of the eastern coast of Brazil, we can assume that the Chiriguano brought this cultural possession from their native land.

C
252
412
[171]

The fact that mandioca is not important in the economy of these Indians explains why they do not use the wooden grater, the application of which is diffused among so many other Indian tribes of South America who cultivate this nourishing root.

Making Cord and Thread

C
Ce
283

The thread that the Chiriguano and Chané make out of wool or cotton is spun by means of the spindle, while that made of caraguata is twisted by hand. We have no information on the way this caraguata thread is twisted.

/57 cont./

C
Ce
283

The direction in which the threads are twisted by these Indians is generally to the left, while the two skeins which generally make up each thread are usually twisted to the right. See the two sketches shown in Figure 137 /see p.201/. The rather heavy cotton cord stretched out on the loom shown in Figure 104 /see p.176/, used for stretching the warp, is twisted to the right, but it consists of three special threads twisted to the left, which in turn are each made up of two skeins twisted to the right. The strings for the bows for shooting arrows, made of only one skein of animal hide, are twisted to the right. The rule is that all threads, whether they be caraguata threads made by hand or wool or cotton threads made with the spindle, are twisted to the left, made up of two skeins twisted to the right. In examining many threads of the Chiriguano and the Izozó, I found only two exceptions to this rule. Of the two threads wound together on the reel I.A. 413 /I.A. 513 in Fig. 91, p.147/ and each made of two skeins, one is twisted to the right and the other to the left, and the thick wool threads of the warp of the plaited hammock I.A. 448 are twisted to the right, being made of two skeins twisted to the left.

The spindles that I obtained from the Chiriguano and Izozó are the type of spindle, very common among the Indians of South America, that Nordenskiöld calls "Bakairí type" in contrast to the "Bororo type," this nomenclature being based on the first description of these two types of spindles by Carl von den Steinen, who found them among the Bakairí /Bacairi/ on the one hand and among the Bororó on the other (258). In contrast with the

/59 cont./

Spinning among South American Indians/.
Göteborg. 1910.

"Bororo type," the "Bacairí type" of spindle is held in a vertical position when used for spinning and has a small enlargement in the form of a knob at the upper end of the stick. In spinning, the prepared thread winds around the upper piece of the stick. The material of the Chiriguano and Izozó whorls is baked clay (that of the Chiriguano, pieces of broken baked clay vessels, filed), wood, or, rarely, among the Chiriguano, stone.

Ee
[32]

Ee
283

From the measurements mentioned above, it seems that the Chiriguano whorls usually have a rather larger diameter than the spindle whorls of the Izozó. The longest stick in the collection (from the Izozó) measures 54.5 cm.; the shortest (from the Chiriguano), 25.5 cm.

As I have already mentioned, all the sticks of the Chiriguano and Izozó spindles are fitted at the upper end with an enlargement in the form of a knob. Most of the spindle sticks in addition have an enlargement in the lower part, directly under the place where the whorl is put, so as to prevent the whorl from coming down the stick when the spindle is in a vertical position. Many spindles have a wrapping of cotton or raw wool directly under the whorl in order to make the whorl secure.

The form of the whorls shows many variations. I have already mentioned that the Chiriguano whorls are generally larger than those of the Izozó. They are also more uniform. The two sides of the baked clay of the Chiriguano are simply flat and smooth, which results from their origin as pieces of broken baked clay vessels to which the Chiriguano give the form of a disk by filing them and which they perforate in the center. The stone whorls of the Chiriguano /60/ and most of the wooden whorls also show the same form. But among the latter there are also some (cf. Fig. 87 /see p. 147/) which are similar to the more complicated forms of the Izozó whorls, although they differ from the latter in their greater size.

Ee
283
[171]

Among the Izozó whorls only two have two flat sides like the Chiriguano whorls. The other Izozó whorls, not only those of baked clay but also the wooden ones, show great variation in

form. many of them being similar in form to the whorls of the ancient Peruvians. Cf. Figures 89 and 90 /see p. 147/.

P 285 178

The Technique of Plaiting

In a legend told to me by a Paresí Indian in Mato Grosso, the appearance of a new epoch is discussed. The young generation of the Paramís /Paresi/ complains to the grandfather that they have now forgotton the manufacture of the bottoms of their different baskets, that is, the beginning and thus the rudiment of that work. The Chiriguano can make the same complaint to their grandfathers. They have also forgotten, as a result of the appearance of a new era, that is, as a result of their contacts with the whites, most of the elements of the art of plaiting, and imitations of European merchandise or of the plaited objects of neighboring Indians, less cultivated than they, are only poor compensation.

C 285 178

C 285 171

Of the four principal types into which all the plaited objects of the Indians of South America can be classified with regard to their technique, which I have called in my publications which deal with them (259) "Stufengeflechte /step plaiting/,

259. Max Schmidt. Lehrbuch der Völkerkunde /Textbook for Ethnology/, Berlin. 1924. pp. 154-157.

Doppelfadengeflechte /double-thread plaiting/, Rohrstuhlgeflechte /caning/, and Geflechte in Spiralwulsttechnik /plaiting in coiling technique/," only the first two can be found among the Chiriguano and the Chané-Izozó. It is surprising that the fourth type (Geflechte in Spiralwulsttechnik) of plaited objects does not exist among these Indians, because this technique was the most common one in the mountainous regions neighboring Chiriguano territory.

6t Schmidt--156 E-5 (1901) 1909 SF10 Chiriguano SF10
Chane SF8
I2020

/60 cont./

C 285 Plaited objects of the first type are made in such a way that the strips of one group are plaited with the strips of another group vertical to the first one, in such a way that the strips of the first group pass alternately a certain number of the strips of the second group and are passed by them, and in such a way that the meshes which go in the same direction form lines of steps. The number of the strips passed each time by one strip of the other group is generally three or two at a time, but there are cases in which only one strip is passed each time.

C [126] [513] [415] [291] Among the plaited objects of this type, I obtained from the Chiriguano a large sleeping mat, small flat baskets /canastillas/, sieves, a quadrangular basket /cesta/, and a hat, and from the Izoró small flat baskets /canastillas/ similar to those of the Chiriguano and two different kinds of baskets /cestas/. In addition, the Chiriguano and Chané also infrequently use fans for fanning the fire (tapékua) plaited out of palm leaves (260).

Cc [415] [186]

C Cc 285 372

260. Nord. 1, p. 56.

Métraux has described and shown in a drawing such a fan for fanning the fire. This fan is plaited out of the leaves of the caranday palm in the "Stufengeflechte" style, in such a way that strips of the first group pass alternately two strips of the second group and are /Plates XXVI-XXVII appear here/ /61/ passed by them. The leaflets, separated from the stem, enlace a stick which, forming the upper edge of the fan, replaces the stem of the pinnate leaves of other palms which are used by other tribes of South American Indians in the manufacture of plaited fans (261).

The material of the plaited objects that I have mentioned above consists of strips of palm leaves or strips of cane, and that of the Chiriguano basket I.A. 551, of strips of wood. Because these Indians do not have palms with pinnate leaves available, they [C 324] must use the peltate leaves of the caranday, from which comes the difference between the plaited objects of these Indians and those of other tribes.

of other tribes. For example, the Guató Indians make mats similar to the mat collected among the Chiriguano, as well as baskets similar to one type of basket from the Iaméó, from the large pinnate leaves of the *arari* palm (*Copra whitcophylla* Mart.). The stem or stems of these, from which go the leaflets that form the plaiting, form the upper edge of the mat or baskets. With regard to the carandey palm, it is necessary to detach the leaflets from the stem in order to place them in the position necessary for plaiting them with one another. Therefore the upper edge is formed like a braid to which the leaves are attached in order to be able to proceed to plait from this rudiment. The lower edge is also formed like a braid, which joins the free ends of the strips and terminates in two ends, one at each /62/ side, which project beyond the side edges of the mat. The mat is plaited in such a way that one strip passes two of the other group each time. The decoration is made up of simple stripes parallel to the upper edge of the mat.

C
Ca
285
531

The small flat baskets of the Chiriguano and Iaméó are, in general, similar in form and dimensions. These are plaited with strips of cane and, at their outer edge, have a wooden hoop. Like the mat which has been mentioned, they are plaited in such a way that one strip of one group always passes two strips of the other group, and therefore the surface shows the same ornamentation, which consists of parallel stripes and is typical of all objects plaited in this way. In this ornamentation of the flat baskets there is one difference in that on some of them the entire surface is always filled with parallel lines, all going in the same direction (cf. Fig. 946 /see p. 157/), while the decoration of most of these small baskets consists of concentric squares (cf. Fig. 98 a and b /see p. 157/) formed by the combination of four surface units, two of which show parallel lines in the direction vertical to that of the parallel lines of the other two units. With regard to the details of the formation of such decoration by the technique itself, I refer to my publications regarding this matter (262).

[126]

The three sieves that I obtained from the Chiriguano correspond to the flat baskets described above with respect to their exterior form and to the rudiment of the plaiting. They differ from the latter only in that their strips are a certain distance apart and in that one strip of one group always passes only one of the other group, with the result that the ornamentation of the surface consisting of parallel lines which is shown in the little baskets is not produced. These sieves are also provided with handles like the flat baskets of the Chiriguano. A sketch of a Chaná sieve shown by Nordenskiöld shows that these Indians also use such sieves (263). Flat baskets and sieves analogous to

[119]

The technique of the Chiriguano hat (I.A. 104) is not original, but no doubt was received from the whites and perhaps was directly taught to the Indians in the missions. For us the technique of this hat is without interest, except for the fact that this technique is also applied by the Indians to the making of a type of basket, a specimen of which is shown in Figure 98b /see p. 154/. The manufacture of the hat begins at the center, and the strips, the beginning of which is plaited, are augmented by the addition of other strips. See Figure 99 /see p. 156/. The style of plaiting is like that of all the other objects of this kind among the Chiriguano and Chaná, so that one strip of one group always passes two strips of the other group.

CC
[285]
CC
[285]

/42 cont./

The technique of the small bag I.A. 512, which has a cover and corresponds in form to a modern cigar case, is of no interest to us, because this is a product of modern manufacture.

Baskets I.A. 551 (of the Chiriguano) and I.A. 677 (of the Ipurinã) are of special interest because they represent the product of a new era in which the primordial devices of the technique have been forgotten and therefore they have lost the typical forms of the products of these techniques. The making of this type of basket, which is widespread among the Indian tribes of South America, begins with the making of the bottom and ends at the upper edge of the basket where the free ends of the strips are /43/ fastened. If we compare the structure of the bottom of these Chiriguano baskets with the structure of corresponding baskets of other tribes of South American Indians, such as with the structure of the baskets of the Bororó on the tributaries of the Xingú River (Mato Grosso, Brazil) or of the tribes of the Rio Negro, our attention is drawn to the great difference with respect to the conformity of the work. In my above-mentioned publications (703) I have described this kind of basket in more

703. Max Schmidt: Indianerstudien, loc. cit., and Die technischen Voraussetzungen, pp. 197 and 198.

detail, and I have demonstrated that the special design which appears in two variations on the bottom of most of the baskets of this kind that are not yet degenerate is consistent with the technique, because only a bottom decorated in this way can be a proper beginning in order to form the walls of the basket. Moreover, there is the difficulty that for the fabrication of the four walls of one of these baskets one needs twice as many strips as the number of the free ends which come out of the plaited square or rectangle which forms the bottom of the basket. Therefore, the Indians who still know exactly how to plait these baskets plait in the beginning a flat rectangular piece twice as large as the projected bottom of the basket. Then the four edges of this rectangle are folded upward, in this

St Schmidt--164 E-5 (1935) 1938 SF10 Chiriguano SF10
Chané SF8
Izozo

/63 cont./

Ce 285

way serving as parts of the walls of the basket, the latter then being completed by plaiting the free ends of the strips with one another. By this device they manage to obtain a sufficient number of strips to form the walls of the basket. The Chiriguano and Chané of today are ignorant of this device and therefore they cannot make exact baskets of this kind. We do not know whether they gradually forgot the devices of their primordial plaiting technique under the influence of imported crafts or through the introduction of new ideas, or whether they may have imitated forms of baskets which they saw among other tribes of Indians without knowing the devices of the technique.

Ce 285 175 178

The bottoms and thus the rudiments of the two baskets I. A. 678 and 725a, shown in Figures 86a and 98b, are formed in a manner completely different from the bottoms of the two baskets described above. In making these baskets the Indians have availed themselves of the experience which they have had in the manufacture of the modern hat described above. Beginning the plaiting of these two baskets in the center of the bottom exactly corresponds to the beginning of making the hat, outside of the fact that the strips of the baskets, consisting of caranday palm leaflets, are wider and therefore the mesh is much larger. Where the side walls of the basket begin and more strips are needed than for the bottom, other strips are added, but, in contrast to the manufacture of the hat, by means of a kind of plaiting that joins the free ends of the original strips with the additional strips so that all together they are used to weave the sides of the basket. Also, the analogous baskets of the Chiriguano of the Caipipendi valley described and shown in drawings by Métraux seem to be strongly influenced by modern techniques (266).

266. Métraux. I, pp. 454-457. Plates 58-61.

Ce 285

One type completely different from the baskets described above is shown in the Izozó baskets I. A. 679-686. The plaiting of these does not begin at the bottom like the plaiting of the other baskets, but at the upper edge, and it ends with the making of the bottom. I have minutely described this type of

Chiwe SF 5
Izozo
Guato SF15

/69 cont./

Ce 285

basket, which appears among many other Indian tribes of South America, in dealing with the corresponding baskets of the Guató Indians, and I refer here to the pertinent descriptions and diagramatic sketches made to explain the manufacture of this type of basket (307).

Ce [113]

307. Max Schmidt: Indianerstudien in Zentralbrasilien, pp. 221-227.

Go 524 286

Because the Guató use the pinnate leaves of the acuri palm as /64/ material for these baskets, they are able to leave the leaflets needed for plaiting the basket attached to the stem, which thus forms the upper edge of the basket. The Izozó, not having pinnate palm leaves available, have to use the peltate leaves of the carandey. They must remove the leaflets of these in order to use them for the making of baskets. Therefore these baskets begin at the upper edge with a kind of braid, which unites the separate leaflets for plaiting the walls of the basket. As Figures 96 and 97 show, this braid begins and ends with a knot. These two knots are found at the side of the basket or at the middle of the wall and are in most cases tied with a thread wrapping to prevent an interruption of the rim at that place. The strips coming out of the braid are interwoven in such a way that a sleeve form results, the opening of which, below, is closed by a double braid whose two ends at the two sides of the basket pass through the wall and come out again on the outside of the wall, each one ending in a knot. The ends of the braids of the bottom of basket I. A. 683 (cf. Figure 97 /see p. 158/ form at the same time the handle of the basket. The handles of other baskets of this kind consist of a string or a strip of leather.

Ce 285 [524]

C Ca 286 [301]

Braids like or similar to those which sometimes form the handles of the baskets described above are used by the Chiriguano and the Izozó in other cases as well, such as sometimes in the fringes of the fajas and especially for making the middle section of the women's hair bands previously mentioned.

C
Ce
286

/64 cont./

There may be variations in these braids according to the difference in the number of skeins plaited and the number of strips which are passed each time by one strip of the braid, as Figures 139-141 show /see p.201/. The greater the number of skeins in the braid, the more the form of one string of the braid takes on the appearance of a band. Cf. Figure 32 a and b /see p. 62/.

C
Ce
171

To the second of the four kinds of plaited objects into which all the plaited objects of the South American Indians can be classified belong those which are plaited in such a way that one row of sticks, threads, or similar things are united so that a double thread passes the row, continuously or at certain intervals, and in such a way that the two individual threads of the double thread encircle in each rotation one or more of the little sticks or threads of the row.

C
126
352
513
286

Among the objects plaited by this technique there are two Chiriguano hammocks and one Izozó saddle covering in the collection.

Ce
492
286
126

Objects Plaited with Double Thread, from the Collection

I. A. 448. Hammock (Chirig.). Wool. Lgth. 2.60 m. Width 0.75 m. (Fig. 102b and 109.)
I. A. 449. Hammock " " " 2.05 m. " 0.60 m. (Fig. 110.)
I. A. 8.4. Saddle covering (Izozó) " 1.21 m. " 0.57 m. (Fig. 103b and 129.)

C
352
286

The threads of the hammocks mentioned above are made of wool and that applies not only to the warp threads but also to the double threads. The manufacture of these hammocks is explained in two schematic drawings shown in Figures 109 and 110 /see Figs. 127 and 128, p.190/. The diagram in Figures 109 /Fig. 127/ shows the place in hammock I. A. 448 where the double thread begins to pass through the row of warp threads. The arrangement of the warp threads can be explained only by the manner in which a warp of one continuous thread was made first and in the form of a sleeve, /65/ as the warp of weavings done on a loom

C
352
286

/35 cont./

is made. The double threads, when they pass through the warp threads, encircle with each loop caused by their rotation one thread of the front side of the warp and one thread of the back of the warp. Only at the side edge do they encircle, as Figure 109 /Fig. 127/ shows, three or four threads with each loop. The double thread which begins at the right side of the diagram runs through the entire width of the warp in the way shown in the diagram. When it arrives at the other side, the double thread does not turn around to pass through the warp in the opposite direction, but its ends are fastened, and at set distances other double threads pass through the warp in the same way as the first. Hammock I. A. 449 shows the same arrangement of threads and warp, and the double thread passes through the warp in the same manner, except that at the side edge too it encircles only two threads of the warp, and in this case too one thread of the front side of the warp and one thread of the back side of it. See the diagram shown in Figure 110 /Fig. 128/.

Ce
492
286

The Izozó saddle cover mentioned above shows a peculiarity inasmuch as the double threads are compressed, one beside the other, in such a way that they form a compact material in which the warp threads disappear under the double threads. Likewise in this saddle cover two warp threads are encircled by each loop of the double thread, and more threads only at the two sides. But one difference from the hammocks plaited with double thread is that the double thread, after having passed through the warp threads from one side to the other side, returns in the opposite direction, passing through the warp threads. Another peculiarity is that each of the consecutive rows of the mesh of the double thread shows an opposite direction each time, as a result of which there appears a kind of decoration on the surface, consisting of stripes. As the diagram in Figure 111 /Fig. 129; see p.190/ shows this peculiarity is produced by the special way in which the outer warp threads are encircled by the double thread.

/65 cont./

415 Wooden Hoops for Storing Possessions, in the Collection

[126] I. A. 580. A pair of hoops (Chiriguano). Diameter 53 cm.
I. A. 581. " " " " " " 51 cm.
I. A. 582. " " " " " " 46 cm.
I. A. 583. " " " " " " 43 cm. (Fig. 41).
I. A. 584. One hoop " " 48 cm.

In the Chiriguano houses in Macharete I found hanging wooden hoops, which, usually in pairs, served for storing various possessions of the Indians. The circular area of the hoops is filled in with strips of cane that are stretched across the hoop and interwoven as Figure 41 shows. The hoops are provided with strings or strips of leather in order to be hung in the houses (268).

[285]

268. See Métraux I, p. 471, Figs. 126 and 127.

285 Modern Plaited Objects in the Collection

126 I. A. 503. Basket (Chiriguano). Diam. 18 cm. Height 12.5 cm.
I. A. 550. " " " 27 cm. " 13 cm.
I. A. 552. " " " 31 cm. " 23 cm.
I. A. 553 Flat basket " " 56 cm. " 16 cm.

/66/ I obtained from the Chiriguano some baskets whose technique is completely different from the technique of the baskets described above. They are so similar to the baskets commonly used by the Paraguayans that we must consider them products of an absolutely modern craft, and it is not necessary for us to deal with their technique. Nordenskiöld and Métraux show in sketches and describe such baskets of the Chiriguano, among which some have handles and others lids (269).

The Technique of Weaving

On the occasion of the publication of a Paressí-Kabichí /Paressi-Cabishi/ loom (270), I called attention to the great

P
[113]

270. Max Schmidt, Die Paressi-Kabichí, Ethnologische Ergebnisse der Expedition zu den Quellen des Jauru und Juruena in Jahre 1910 /The Paressi-Cabishi, Ethnological Results of the Expedition to the Headwaters of the Jauru and Juruena in the Year 1910/, Baessler-Archiv., Vol. IV, No. 4/5, 1914, pp. 214 and 215.

similarity among all the looms known up to now among the Aruaco /Arawak/ tribes. The loom that I obtained from the Izozó corresponds in form and construction to the Paressí-Kabichí loom described and shown in a sketch by me, but it demonstrates, discounting some insignificant anomalies, a perfection which Nordenskiöld has already mentioned (271).

I. A. 743. " " " " " 128 cm.

Before describing the Izozó loom mentioned in the preceding list and shown in Figure 104, we must emphasize that in this case we are dealing with a very small one. Ordinarily Izozó and Chiriguano looms are considerably larger, as has already been shown by the length and width of their fabrics. But I had to be content with a small one, because most of the larger Izozó looms were mounted on trees, a vertical post of the loom being formed by a tree trunk, and because at the beginning of my trip I was unable to carry objects too large and difficult to transport. A large Chané loom is shown in a drawing by Nordenskiöld (272).

C
[286]

272. Nord. 1, Fig. 123.

Ce
286

As Figure 104 shows, the frame of the Izozó loom is formed by two vertical poles and two horizontal ones. The vertical poles are provided /67/ at their upper ends with forks and are set in the ground at a certain distance from each other. The upper horizontal pole is placed in the two forks of the vertical poles, and the lower horizontal is secured to them, at a short distance from the ground, by a binding.

P
286

On the Paressi-Kabichí looms the warp is made simply by rolling one thread continually around the two horizontal poles. As a result, the warp, when ready, encircles the two horizontal posts like a ring, half of which is on the front side of the loom and the other half on the back part. From the construction of a warp formed in such a way, certain conditions of the form of the fabrics made with such a loom result. If the entire warp is utilized by transforming the entire ring of the threads of the warp, by weaving, into a single piece, this fabric necessarily also has the form of a ring or of a sleeve, like, for example, Paressi-Kabichí tipoys. But when one wishes to make a flat fabric, for example,

Chané SF3
Izozo
Paressi SP19

/37 cont./

P 286 a band, it is necessary to leave one part of the warp threads free and to cut them at that place. The fabric formed in this way has the disadvantage that it is necessary to secure the woof at both ends in some way. On the Chané-Izozó and Chiriguano looms C Ce 286 this disadvantage is avoided by the ingenious device illustrated in the diagram shown in Figure 105. The warp on this loom is not formed in such a way that the thread which forms it is simply rolled around the two horizontal poles of the loom frame. As Figure 105 shows, a string is extended between the two vertical poles at the place where the woof is to start. The thread which forms the warp first passes this extended string, passes the lower horizontal pole and then to the upper horizontal pole, again passes to the extended thread, going around it and returning to the upper horizontal pole, and thus as before until, after having already once bound the extended thread, it is fixed into the weave. Also in this case the prepared warp forms a ring, and thus the Chiriguano and Chané can manufacture with their loom, like the Paressi-Kabichí, fabrics in the form of a sleeve without a seam, of which the tipoy, so common among the women, is an example. But, as the diagram also shows, such a ring can be opened at will by removing the extended string, the result being a flat fabric whose four edges are secured by the manipulation of the same weaving operation. From the fact that the threads of the fringes of the Chiriguano and Izozó fajas end in loops, it follows also that the fajas of these Indians were woven with such a loom provided with the extended string, which was later removed.

P Ce 286 Instead of the small stick that the Paressi-Kabichí pass between the odd and even threads of the warp in order to arrange its "normal formation" so that the even threads are below and the odd threads are above, or vice versa, Izozó looms have a twisted string of caraguata fibers which passes through the warp in the same way and is secured at both ends to the vertical poles of the loom.

/67 cont./

P Ce 286 In order to be able to form easily by a single manipulation the second formation of the warp threads, in which the even threads, which were below in the normal formation are brought up, passing the odd threads, the mechanism represented by the diagram in Figure 106 is constructed. As this figure shows, this mechanism consists of small loops of cotton thread which encircle the even threads of the warp and are tied to one another. This Izozó mechanism is different from the corresponding one of the Paressi-Kabichí loom, in that it is not provided, like the latter, with a small stick which serves to join the aforementioned loops to one another.

Ce 286 /68/ By pulling the warp its position can be varied so that the part of the warp which is being worked is always at the proper height and on the front side of the loom. This can also be effected by moving the lower horizontal pole of the loom frame, which the warp threads are always pulling.

In order to be able to pass the woof thread alternately through the two divisions of the warp threads formed by the string and loops mentioned in the foregoing, these divisions are opened by means of a kind of wooden sword, of which the collection has five specimens in addition to the two which go with the loom. Two of these measure more than a meter, since they are intended for working with much larger looms than the one shown in Figure 104. This implement at the same time is used to fix the woof thread to the finished part of the woven material after it has passed through the warp.

The shuttle, by means of which the woof thread is passed through the two divisions of the warp threads alternately from left to right and from right to left, consists of a simple little stick on which the thread is wrapped. In the list of objects in the collection, two specimens of such shuttles from the Izozó are mentioned, in addition to the one which belongs to the loom. See Figures 91 d and e.

C Ce 286 126 In addition to these implements I acquired two others in the form of a bodkin and made of wood, which are used to arrange the warp threads. One of these is from the Chiriguano, and the other from the Izozó. Combs, which were used by the ancient Peruvian for this purpose, are not used by the Chiriguano or the Chané.

/68 cont./

C Ce 286 174 177 In addition to this usual type of loom, there can also be found among the Chané and Chiriguano other special types which correspond to the ancient Peruvian types of looms for weaving bands. The fact that the mechanism of these looms makes possible the formation of more divisions of the warp threads, makes more variations in the ornamentation possible. Nordenskiöld shows such a Chiriguano loom in a drawing (273). No doubt this kind

273. Nord. 2, Fig. 55, N. 4.

of loom is a product of the influence of the culture of the ancient Peruvians.

C Ce 286 For different purposes, very different weavings, most of which have already been mentioned in the chapter on clothing, can be made with a loom provided with a warp in the form of a ring as described above. With regard to the measurements of these fabrics, I refer the reader to what I have already said in this respect. The material of all of these woven fabrics consists of cotton or wool threads.

Of the three tipoys in the collection acquired from the Izozó, one (I.A. 820) consists of a fabric in the form of a sleeve made with the warp in this form. The woolen tipoy (I.A. 832) was lengthened by sewing together two such woven pieces, one beside the other. The structure of the weaving clearly shows the thread which was extended between the two vertical poles of the loom before making the warp, and which remained in the cloth. Tipoy I.A. 838 is not typical and consists of a flat piece of weaving whose two facing edges were sewed together.

C
Ce
291
286

With regard to the making of ponchos, we must mention that those of the Chiriguano consist of two pieces of woven material sewed to each other in the direction of the slit of the poncho, while Izozó ponchos most often consist of a single piece of weaving made across the entire width of the loom and therefore do not show a seam in the middle part such as Chiriguano ponchos show. From the stiff edges in the direction of the woof, it can clearly be seen that the special mechanism

C
Ce
291
286

/69 cont./

of the Chiriguano and the Chané-Izozó, which consists of the thread extended between the two vertical poles of the loom, was used. After finishing the work of weaving, the thread was taken out of the woven piece to transform it into a flat piece.

The slit in the ponchos woven in one piece is not made by cutting the cloth after it has been finished, but is formed in the very act of weaving. As the diagram represented in Figure 113 shows, the slit is made in such a way that in the part of the warp in which the slit is made the woof thread does not pass through the entire warp, but returns when it has passed half of it, to pass through the following division of the warp threads in the opposite direction. The result of this method of weaving is that the slit of the poncho is provided with a firm edge. We must still mention the peculiarity of the Chiriguano and Izozó ponchos, whose four sides are folded and sewed to the rest of the weaving. For that reason the ponchos of these Indians have round edges. Cf. Figures 117 and 118 /see p.187/.

Ce
291
286

Of the Izozó mantas, only one consists of two pieces of weaving sewed together. Some others have been formed from ponchos by sewing up their slits.

Ce
301
286

/70/ The men's hair bands also clearly show that they were woven on a loom like the one which we have described above and which was fitted with the thread extended between the two vertical poles of the loom. Except for only one of these bands (I. A. 659), the fringes of the rest of them all end in loops of thread in such a way that it is not possible that the warp, previously in the shape of a ring, might have later been cut. The loops of free thread at the two ends of these bands can be secured in a very different manner, as is shown by the diagrams in Figures 107-110.

The manufacture of the two men's hair bands woven of human hair and similar in form to the fajas is the same as that of the cotton bands, in addition to which the loops of the free threads are secured in a simpler manner. Cf. the diagram shown in Figure 111 /see p. 177/.

C
Ce /70 cont./
291
286 The manufacture of the fajas of wool or cotton is like that of the men's hair bands woven of human hair. The manner of securing the loops of the free threads at the end of the fajas is also in general the same, as Figure 111 shows, except only that the fringes consist of more than one of these loops, with the result that they form thicker, twisted threads, which end in knots.

Ce
492
286 Of the two saddle covers, one (I.A. 842) is woven in the ordinary fashion of mantas, while the other, I.A. 843, shows in its manufacture the peculiarity that each time two woof threads pass through the same division of warp threads this is done in such a way that one of these two woof threads passes through the division from left to right, and the other from right to left. The diagram shown in Figure 126 shows the course of this double woof thread and also shows how in this way they manage to make the edge of the piece of weaving firmer than it would have been had the two woof threads passed through the division of warp threads in the same direction.

C
415
286 The weaving from which the Chiriguano bag I.A. 444 was made was not made up of a fabric in the form of a manta. By sewing up the two narrower sides, there was first made a piece in the form of a sleeve, from which the bag was made by sewing the edges together, leaving only one part open for the opening.

The double bags mentioned above are made of a flat fabric of either wool or cotton thread, by folding over the two ends and sewing the edges together. The diagram shown in Figure 112 shows the flat fabric before the edges are sewed. All the outside edges of the material are secured by the process of weaving itself, since the fabric is first made in the form of a sleeve and then changed into a flat piece by removing the thread which was extended between the two vertical poles of the loom. Also, the edges, indicated in the diagram by EF, GH, EL, GL, FK, and HM, are secured by the weaving process, which was managed by passing the woof thread through the divisions of the warp, only by parts in the way we know for making the slit in ponchos. Only in those places indicated on the diagram as JL and MK are the warp threads cut in such a way that these sides of the piece

C
415
286

/70 cont./

of weaving are not secured by the weaving process itself. In order to change the piece of weaving described in the foregoing into the double bag, its two ends are folded over at the dotted lines in the diagram, with the result that points A, B, C, and D are placed on top of points A/, B/, C/, and D/. Then the edges which are placed one on top of the other (OA/, OB/, PD/, and BC/) /71/ are sewed together. The parts EILG and FKMH are doubled in the opposite direction to form the tops of the double bag.

C
C6
286

171

In accordance with the simple mechanism of the loom with which the Chiriguano and the Chané-Izozó make their textiles, the possibilities of producing variations in the ornamentation of these are very limited. The variations in ornamentation of the weavings of the Chaco tribes, such as, in particular, those of the Churupí /Chulupi/, which consist of frets, zigzags, rhombuses, and many other figures, are not found among the ornamentations of the weavings of the Chiriguano and Chané.

C
C6
286
531
[177]

Because today the woven goods of these Indians, especially the fajas and the ponchos, are often woven with imported thread or, if they are woven with native wool or cotton thread, these are often dyed with imported dyes, the different colors of the ornamentation on the surface of these weavings have no ethnological importance.

The ornamentation is formed exclusively by the warp threads, due to the fact that the distance between the warp threads is much less than the distance between the wax threads, so that the meshes of the woof disappear completely under those of the warp. Because, outside of that, the formation of the divisions of the warp threads is done by a single mechanism of loops, it can consist only of raising and lowering alternately the even and odd warp threads, for which reason the ornamentation still cannot be influenced by the process of the operation of weaving itself. The structure of this kind of weaving is necessarily such that in the direction of the woof thread, thus vertical to the direction of the warp threads, a row of the meshes formed by the odd warp threads is alternated each time with a row of the meshes formed by the even warp threads. Thus

Chané SF8
I2020

C
Ce
286
531

/7. cont./

In Figures 120-124 the first, third, fifth, seventh, ninth, and eleventh horizontal rows are formed by the meshes of the odd warp threads, numbers 1, 3, 5, and so forth, while the second, fourth, sixth, eighth, and tenth horizontal rows are formed by the meshes of the even threads of the warp, and so forth. The result of this is that all of those odd rows in the direction of the woof are like one another in structure and color, and similarly all of the even rows are like one another in the direction of the woof. Therefore the ornamentation of these weavings can only consist of continual repetition of the ornamentation set by the first two rows in the direction of the woof.

These considerations show that the only possibility of providing these weavings with different ornamentation is by varying the color of the warp threads.

The simplest ornamentation that can be done in this manner consists of simple stripes in the longitudinal direction, that is, in the direction of the warp threads. The unfinished weaving on the loom shown in Figure 104 and the manta I.A. 818 have such a decoration of simple stripes. Figure 120 shows that these stripes in the longitudinal direction are produced in such a way that at certain intervals the color of the warp threads is changed. In addition to these longitudinal stripes and in varying combinations with them, transverse stripes appear as ornamentation in these weavings. Cf. Figures 121-124 /see p. 188/. These are produced in such a way that two threads of different color alternate each time among the warp threads. Thus it comes about that the row of meshes formed by the odd warp threads are different in color from the row of meshes formed by the even threads of the warp. If a single thread of the warp has a color different /77/ from the color of the adjacent threads, does appear in the ornamentation, as Figure 121 shows.

From the above explanations it can be seen that all the ornamentation in these weavings of the Chiriguano and the Chané-Izoré is produced exclusively by the arrangement of warp threads of different colors. The process of weaving is absolutely indifferent to the ornamentation set in the beginning by the arrangement of the warp threads.

I.A. 738. Band " " Length 1.3 cm. " 2.7 cm. (Fig. 115.)

C Ce 286 19

Because of the contacts that the Chiriguano and the Chané had for a long time with the culture of the ancient Peruvians, it is surprising that the highly developed technique of the latter should not have had more influence on the weaving technique of these Indians. The fact is that the Chiriguano even today make most of their weavings with the typical loom of the Arauco and with the warp in the form of a ring, which they doubtless received from the Chané. Besides these ordinary looms, the forms of looms that they received directly or indirectly from the technique of the ancient Peruvians are of little importance.

Ce 286 191

The two Isoró weavings mentioned above, and in particular bag I.A. 737, are weavings that are exactly like the weavings produced to this day by the Quichua /Quechua/ and also the typical weavings of the last period of the Inca Empire.

In order to explain the appearance of such weavings among the Chané of the Parapití, we have an interesting observation by Nordenskiöld. The Indians told that author that they had learned that technique of weaving directly from a Quichua woman who had emigrated into their territory (274).

Ce 191

274. Nord. 2, p. 278.

C 286 199

The Chiriguano loom for weaving bands and shown in a drawing by Nordenskiöld shows that the Chiriguano also learned to weave in the way of the ancient Peruvians (275) /fn. 275, which appears on p. 173, reads: Nord. 2, Fig. 55, N. 4./. In contrast to the manner of weaving described in the preceding, these weavings are made in such a way that the thread of the woof passes alternately through the threads of the front side of the warp and those of the back side. In addition to this, a double mechanism for the divisions of the warp threads makes possible many more variations in the ornamentation.

[352]

With regard to their exterior structure too, the bands with which many of the carrying nets (of the Izozó and some of the Chiriguano ones) and one Chiriguano hammock are provided are similar to the weavings. But these /Plates XXXII-XXXV appear here/ /73/ objects are made without any special mechanism for making the divisions of the warp threads.

Figure 125 shows the structure of the band of the net I.A. 768. (Cf. Fig. 133 /see p.200/.) The diagram shows the way in which these bands are made. First the longitudinal threads are stretched in a way similar to the manner of stretching the warp threads of common weavings between the horizontal poles of the frame of the loom, but without using the special thread extended between the two vertical poles of the loom. Then they pass a transverse thread, which corresponds to the woof thread of common weavings, through the two rows of longitudinal threads alternately from the right to the left and from the left to the right, in such a way that this thread is left alternately under one thread of the back row of longitudinal threads and on top of one thread of the front row. Thus the manufacture of these bands and of hammock I.A. 450 is different from that of common weavings principally in the fact that the woof thread passes simultaneously through the threads of the front side and of the back side of the warp. Sundry irregularities in the course of the threads of the warp show that weavings of this kind have been made without using a mechanism for making the divisions of the warp threads.

The Technique of Making Nets

C
Ce
286

The technique of making nets is widespread among the Chiriguano and Chané and is used to make various objects, such as fishnets, hammocks, nets for carrying burdens, bags, and slings. The material used for making these nets generally consists of threads made of caraguata fibers. In the collection there are two Chiriguano burden-carrying nets made of woolen threads and another one made of strips of cowhide.

C
Ce
[283]
[824]
C
[482]

The common technique of making nets among the Chiriguano and the Chané is the technique called "Knotentechnik," in German, using the knot called the reef knot in English. Figure 138, a and b, shows such a "reef knot," and Figure 142 shows the technique of making nets with this "reef knot." According to Nordenskiöld (275), the Chiriguano and Chané use small

C
Ce
[284]

275. Nord. 3, p. 207.

rectangular boards for making their nets, like those with which we are familiar from many other tribes of South America. Unfortunately, I did not acquire such a board from the Chiriguano or from the Izozó. By continually wrapping the first board with a thread the simple loops which are shown in the diagram (Figure 142) in the upper row are formed. The thread, after having reached the other end of the board, are wrapped continuously in the opposite direction around a second board, being connected each time, with a knot, with the loops of the thread wrapped around the first board. If the thread has been looped in the manner described, until it gets to the first loop of the first row, the first board can be removed to serve in the formation of the third row of the meshes of the net, which is made in the same way as the second, but in the opposite direction. It is clear that nets made with this technique, in their simplest and least complicated form, must have a rectangular form, and this form is typical of all of the nets of the Chiriguano and Izozó, while various other South American tribes, for example, the Bakairí /Bacairi/, who formerly lived on the tributaries of the Xingú River (in Mato Grosso), make triangular nets.

411 I. A. 509. " " " " 14 cm.
286

C Ce 286 352 227 136

From the large size of the mesh of nets I. A. 360, 766, and 794, it follows that they are hammocks. Because in Chiriguano and Chané territory there are generally no fish except small ones, nets for fishing must have considerably smaller meshes.

C Ce 415 286 482 [283]

Of the Chiriguano nets for carrying loads, two are made of wool and one of these has a band like most such nets from the Izozó. The rest of these nets from the Chiriguano and the Izozó are made of caraguata thread. Some of them haye a rather small mesh, but among those of the Izozo those with big mesh are the rule.

/74 cont./

000 small mesh, but among those of the Izozó those with big mesh
Ce are the rule. Thus the mesh of the Izozó nets used for carrying
286 the large water jars is also very large. Most of these Izozó
415 nets have a special band that goes over the forehead of the
482 bearer. The structure of these bands, which are made of caraguata, wool, or cotton, have already been described by us in the chapter on weavings. Cf. Figure 133 /see p. 200/ and the diagram shown in Figure 125 /see p. 190/.

Ce The collection has two net bags from the Izozó which are
286 made in such a way that the whole rectangular net is folded
415 in the middle and the pieces which are on top of one another
[126] are laced together with a thread on the two longitudinal sides.

Ce In the way described in the foregoing they also make the
286 net of the fishing implement I. A. 764 described in the chapter
227 on fishing and shown in Figure 39. Because this implement is used to catch small fish, the net has very small mesh. The
Ce slings described among the hunting implements are also made
[411] in the same way.
[224]

I. A. 568.	" " " " " "	1.20 m. (Fig. 144.)

286
284
415
482

From the Chiriguano I obtained several nets for carrying burdens, which are made without using knots, by connecting the thread in the fashion illustrated by Figures 143 and 144 and which is common among many tribes of the Chaco, as happens among the Tapieté, Matako /Mataco/, Toba, Chorote /Choroti/, and Churupí /Chulupi/.

The great number of nets that I acquired from the Izozó are made with knots without exception, and we must therefore assume that these Indians are not familiar with or do not use the technique of making nets with simple loops and without applying knots, and that this technique, called "Schlingtechnik" in German, is used only by the Chiriguano or a part of them. Nordenskiöld does not mention this technique among the Chiriguano, and in the synoptic outline in which the several techniques of making nets are illustrated the Chiriguano are not mentioned in Column 5 among the Indian tribes which use the technique of making nets without applying knots. Of the burden-carrying nets made of caraguata thread that I acquired from the Chiriguano, ten are made without knots being applied, by the technique called "Schlingtechnik," and only seven by applying knots by the technique called "Knotentechnik." We can therefore assume that this part of the Chiriguano at least uses the technique of making nets without applying knots, although this opinion is contrary to that of Nordenskiöld, who says (278) that

286
284
114
177

278. Nord. 2, p. 116.

all of the nets made by this technique found among the Chiriguano and the Chané were acquired from the Chaco Indians.

[296]

/76/ Sewing

With the acquisition of European clothes, naturally the sewing of these clothes to make and mend them became general among the Chiriguano and Chané. Modern sewing needles are an article eagerly sought by them today. But undoubtedly these Indians had already known the technique of sewing with a needle with an eye for a long time through their contact with the culture of the ancient Peruvians. Although the native textiles are, in most cases, made in one piece, needlework coming from other cultures is often added to the native technique of these textiles. I mentioned that a large Izozó tipoy is made of two smaller tipoys sewed together. The ponchos of the Chiriguano in Machareti are made of two pieces sewed together. The four edges of the Chiriguano and Izozó ponchos most of the time are turned and sewed to the rest of the fabric. In the making of the bags for carrying burdens, especially the double bags for loading draft horses or burros, sewing is used.

C
Ce

C
Ce
415

Among the cuyas that I obtained from the Chiriguano and Izozó there are several which show breaks mended by sewing. See Figure 25a /see p. 51/. The two diagrams shown in Figure 130 a and b serve to illustrate the way in which this sewing is done, with cotton thread on the two Izozó cuyas I. A. 666 and 667, and with fine wire on the Chiriguano cuya (I. A. 460). The cuya I. A. 667 shows two such repairs done by sewing.

The Working of Skins and Leather Tanning

Ce 28 [824] [177]

The Chiriguano and Chané know the art of tanning leather, and they use for that the bark of the "Piptadenia" and other trees. No doubt they obtained the knowledge of this craft from the whites. They use not only tanned leather, but also strips of animal skin for the making of sundry objects (279), but the

279. Nord. 2, p. 165.

C 224 [292] 177

craft of working leather and skins is not an important one. It is said that formerly the Chiriguano, when they went hunting, wore leather clothing conforming to the European style (280).

280. Nord. 1, p. 184. Nord. 2, pp. 60, and 61. Viedma, op. cit., p. 181. Cited in Nordenskiöld.

C 281 294

Beyond that, leather is not used for making clothing, except to make sandals (281). The men's modern custom of wearing

C 291 177

281. Nord. 2, p. 69, Fig. 23.

a leather belt must be attributed to the influence of the whites. Without counting its application to the making of bridles and saddles for horses and asses, either draft or saddle animals, on which we have no data, strips cut from leather or from animal skins are used in the form of straps, principally to transport or hanging up some object. In place of the common vegetable-fiber cords, leather straps are often put on the nets for carrying burdens, on hammocks, and also on the hoops mentioned above, in which they keep things. The band of the Chiriguano net for carrying burdens I. A. 564 consists of an untanned cowhide strap. See Figure 134 /see p. 200/. The Izozó vessel I. A. 617 has a leather strap attached to its handles. The strings of the bows for shooting arrows are strips of animal skin, and the Chiriguano net I. A. 573 is made of cowhide strips.

On the Cooking of Meals

Most of the Chiriguano and Chané utensils used /Plates XXXVI-XXXVII appear here/ /77/ for cooking meals have already been mentioned in the preceding chapters, such as pots for cooking food and for fermenting chicha, dishes with holes in the center of the bottom for steaming maize meal, vessels for frying /fritar/ maize, wooden mortars with their pestles, and sieves. For frying /fritar/ meat or fish, the Chiriguano and Chané do not use the quadrangular or triangular stands which are so common among other South American Indians, but instead simple wooden spits (282). Also, as we have already said, the grater for grating mandioca roots is not found among these Indians.

Spatulas for Stirring Foods, Which Are in the Collection

I.A. 501. (Chiriguano) Length 49.5 cm.
I.A. 509. " " 94.5 cm. (Fig. 21)
I.A. 576. " " 114 cm. (Fig. 20b.)
I.A. 577. " " 90 cm.
I.A. 578. " " 62 cm. (Fig. 20a.)
I.A. 579. " " 66.5 cm.

C Ce 412 [531] [171]

These wooden spatulas for stirring are used by the Chiriguano and Chané for stirring the bubbling crock of maize when it is being fermented. Some of these spatulas have decorations on their handles similar to those of the corresponding spatulas of the Guató Indians. Nordenskiöld shows in a sketch such a Chiriguano spatula with a zigzag decoration (283), and beside

C 412 531 237

283. Nord. 2, Fig. 17 A.

it (284) another form of these utensils, from the Chiriguano,

284. Nord. 2, Fig. 17 B.

which consists of the shoulder blade of a large mammal, attached to a wooden handle (285).

285. Nord. 2, p. 55. See Métraux I. Figs. 32 and 34.

C 273

The Making of Fermented Drinks

Concerning the making of maize chicha, that is, the national drink of the Chiriguano, Nordenskiöld says the following (286):

286. Nord. 1, p. 237.

C [412]

First the maize is /78/ ground up in large mortars, then sifted and boiled in large pots with water. A part of this mash,

/78 cont./

C 293 removed from the pot, chewed up and well mixed with saliva, is then mixed back in with the rest. Then it is strained and ferments in large open pots, at moderate heat. By means of C [412] [239] large wooden spatulas or mammals' shoulder blades fitted with wooden handles, the mash is mixed in the pot. We find a more detailed description of this process in the publication by Métraux (787).

787. Métraux I, pp. 365-369.

C Ce 251

The Preservation of Foodstuffs

Concerning the method of preserving foodstuffs, we know that the Chiriguano and Chané dry fish for future use, when fish are abundant (788). According to Niño (789), formerly meat

788. Nord. I, p. 189.

C [113]

789. Niño, F. Bernardino de: Etnografía Chiriguana. La Paz, 1912, pp. 249 and 250. According to Métraux.

from hunting was preserved for the great fiestas by drying it in the sun, without using salt. Even today, when a bovine animal is slaughtered, part of the meat is preserved by drying it in the sun (790).

790. Métraux I, p. 356.

C Ce 501

Transport

The Chiriguano and Chané, in contrast to the Ratipes-Guaraysú, do not have boats (791). Concerning means of

791. Nord. I, p. 198.

/78 cont./ concerning means of transport by land we do not have any evidence except through the sundry implements which serve for carrying burdens. We can assume from the form of the double bags mentioned in the chapter on weaving that they use their horses and burros to transport loads.

The objects used to transport burdens have already been mentioned in preceding chapters. Among them the most general is the carrying net, which often has a band. By means of it burdens are carried on long trips or the fruits of the harvest are brought in from the fields to the houses, or water is brought, often from a distance, to the dwellings. The carrying net is used in such a way that the band goes across the forehead of the bearer so that the weight of the burden rests on his back (293).

293. See Nord. 2, p. 95.

Nordenskiöld has published a photograph of a woman who is carrying a load in her net (293).

293. Nord. 1, Fig. 87.

Baskets are not used by the Chiriguano and Chané for carrying loads: they are used among these Indians only to store things. Neither is any special band used to carry infants: rather they are carried in a fold of the *ciguy*.

Only if water is near the house are water jugs sometimes carried on the shoulder without a net, but not on top of the head. This latter appears only in the cases where the Indians are directly influenced by the whites, as happens in the missions (294).

294. Nord. 2, p. 95.

For carrying small amounts of water when traveling, these Indians also use calabashes enlaced with string, or small baked clay vessels /79/ provided with a string or a leather strap, such as, for example, the vessel I.A. 617 shown in Figure 56b.

C
C5
Ch
191

Flutes and a Whistle in the Collection

I.A. 491. Flute. "sereré" (Chirig.). Wood. Lgth. 17 cm. Width 2.7 cm. (Fig. 33b.)

I.A. 497. " " " " " 20 cm. Width 3.5 cm. (Fig. 22a.)

I.A. 490. Flute (Chiriguano). Cane. Length 43 cm.

/79 cont./

534 I. A. 494. Flute (Chiriguano). Cane. Lgth. 41 cm. (Fig. 34a.)
[126] I. A. 495. Double whistle " " " 33.5 and 7 cm. (Fig. 34b.)

[126] From the Chiriguano in Machareti I acquired two different kinds of flutes, the ones made of cane and the others made of wood. The two wooden flutes I. A. 491 and 492 (cf. Figs. 93a and 93b /see Fig. 33a and b, p. 89/) are of particular importance because of their similarity in form, and in the case of I. A. 491 of decoration as well, to a special kind of balance beam of the ancient Peruvians, and for that reason they have already been dealt with several times in ethnological literature. These two flutes are doubtless quite old specimens which per-
[322] haps had already been used by several generations. They are called "sereré" by the Chiriguano, and they are of hard wood bored from one end to the other. In the middle of the upper edge of the lozenge of the apparatus, there are two small
[301] perforations . . A similar flute shown in a sketch by v. Rosen (299)

299. V. Rosen, op. cit., p. 220.

shows that these perforations serve for a string to pass through, in order that the flute may be worn as a chest ornament.
534 Nordenskiöld (300) has already called attention to the surprising
174
171

300. Nord. 3, pp. 187 and 188.

resemblance between these flutes and a special form of balance beam of the ancient Peruvians. These, numerous specimens of which are known, are no doubt classified as balance beams because of the fact that on some specimens /80/ the cord which passes through the horizontal perforation and which has at one end a weight and at the other end a loop, or some such similar thing for holding the objects that are to be weighed, has been preserved. V. Rosen, describing and showing in a drawing one of these Chiriguano flutes, which is like flute I. A. 491 except that it still has the cord which passes through the two holes on the upper

C /80 cont./
534 edge, puts forward against Nordenskiöld's deductions his opinion
174 that the ancient Peruvian objects of this form might originally
171 have been flutes and that they might have been used only exceptionally, in the event of necessity or only secondarily, as
C balance beams. Among the objects of this kind in the ancient
[114] Peruvian collection of the museum in Berlin so many specimens
C clearly show that they are balance beams that I cannot say that
[177] I agree with this opinion by V. Rosen (301). We must agree
C
[113]

301. Cf. Max Schmidt, Kunst und Kultur von Peru /Art and Culture of Peru/, p. 99, fig. p. 544, N. 8-10.

with V. Nordenskiöld's opinion that these wooden objects used by the ancient Peruvians as balance beams may have been accepted by the Chiriguano, not as balance beams, because the Chiriguano did not have the need to weigh anything, but as flutes. We must mention that with this kind of flute, open at both ends, two different sounds can be produced, depending upon whether the lower hole is left open or is closed with the finger.

The two Chiriguano flutes made of cane have six holes for varying the sound and one hole, at one side, for the mouth. Cf. Figure 39a /see Fig. 34a, p. 89/. Nordenskiöld, who shows
C such a flute in a drawing (302), is of the opinion that the
Ce
534
177
171

302. Nord. 2, Fig. 36 A.

Chiriguano and Chané received this kind of flute from the mestizos or whites, because such flutes provided with a hole at one side for the mouth do not exist among the other Indians of South America or among the ancient Peruvians.

/80 cont./

C
Ce
534

The double whistle I.A. 495 consists of two pieces of cane joined together in the manner of Panpipes. In contrast to the flutes described in the preceding, the two tubes of these whistles have lips. One, which has four holes for making the sounds vary, measures 33.5 cm., and the other, which does not have such holes, is only 7 cm. long. A whistle of this kind, but not double, is shown in a drawing by Nordenskiöld (303).

303. Nord. 2, Fig. 36b.

In addition to these musical instruments, Nordenskiöld describes a few others that he saw among the Chiriguano and Chané. Among them can also be found those round flutes which are used by many tribes of the Chaco and one of which is shown in a sketch by Nordenskiöld (304). They also have large

Ce
[171]

304. Nord. 2, Fig. 35.

trumpets, which the Chiriguano call "angùahuasi," while the common trumpet is called by the same name as is the mortar, "angúa" or "angúarai." One can also find trumpets made out of a cow's horn or a calabash, which are blown at the upper end (305).

C
Ce
[237]
[824]

305. Nord. II, p. 119, Fig. 37 A and B.
Métraux I, p. 337, Fig. 35.

According to Nordenskiöld, the Panpipes, which consist of several flutes joined together, are rarely found among these Indians (306).

306. Nord. 2, p. 126.

C
Ce
415
532

Plastic art is little developed among the Chiriguano and Chané. On rare occasions we find plastic art in the form of animals in the forms of the baked clay pottery of the Chiriguano (307).

/80 cont./
These pots are undoubtedly imitations /Plates XXXVIII-XXXIX appear here/ /81/ of ancient Peruvian models or of modern products. Outside of that there are shown in drawings by Nordenskiöld two dolls in the form of a man and a woman, made of wax, which served as toys for the children of the Chané of the Parapití River (308). Purely decorative plastic sculpture is

308. Nord. 1, Fig. 105.

mainly shown by most of the baked clay vessels intended for cooking foods, in the form of "ornamento hundido" /sunken decoration/, which is generally placed on the surface of the neck of these vessels, but it may also extend over the entire surface. Cf. Figure 48 /see p. 116/. In addition to the sunken decoration on the neck the vessel I.A. 414, shown in Figure 44, is decorated with a row of small pointed additions around the wall of the vessel. Linné shows in a drawing a piece of a Chané baked clay vessel, the surface of which is decorated with a border of baked clay placed in a zigzag around the wall of the vessel. Many of the vessels with smooth surfaces also have small additions and generally in pairs. They often have these instead of handles. In addition the baked clay dishes for eating and the dishes for frying /fritar/ maize are often provided with such additions. The handles of the baked clay vessels are not in the form of figures, but they can be plastically decorated in such a way that a groove divides them into two parts, which can be twisted around each other. Cf. Figures 46 and 49 /see p. 116/.

Some wooden utensils also have primitive plastic ornamentation, such as the spatulas for stirring food and drink, the wooden dishes for eating, and the large dishes or platters on which food is kept. The handles of some of the spatulas for stirring food are carved in such a way that their edges form zigzag lines (cf. fig. I.A. 579 /not illustrated; see Pl. VIII, p. 20/) and the dishes often have additions such as some baked clay dishes also show. Cf. Figures 18 a and b and 19 /see pl. VIII, p. 50/.

C
Ce
531

Drawings are also found on the surface of Chiriguano and Chané objects, in the form of paintings on the surface of baked

/81 cont./

C Ce 531 clay vessels, in the form of incisings on the surface of cuyas and calabashes or flutes of wood or cane, in the form of pyrographic decorations on cuyas, and also, infrequently, in the form of tattooing on parts of the human body. The absolute difference between the drawings applied to the surfaces of baked clay vessels and those on cuyas and calabashes is surprising. This difference is explained by the fact that the decorations on C Ce [562] the baked clay vessels are done exclusively by women and those on cuyas and calabashes by men.

C Ce 531 17 The basic elements of the painting done on the surface of the baked clay vessels of these Indians consist of geometric designs which are completely different from those of the ancient Peruvians and untouched by modern European influences. No doubt these are the products of an old and indigenous art. But we do not know up to what point this originated among the Chiriguano and to what point among the Chané. Neither do we know whether the differences between the nature of the paintings of the Chiriguano in Machareti and that of the paintings of the Izozó of the Parapiti are only local differences or whether they are based on the difference between these two nations. But outside of that primordial decoration and mixed with it, there are foreign elements of decoration which we must reduce to ancient Peruvian models, and this is especially true of the drawings of plants on the surface of a Chiriguano vessel which Figures 64 and 145 show. One /82/ decoration, doubtless also phytomorphic, which appears repeatedly on the surface of the baked clay vessels, for example, on the vessels shown in Figures 67 and 75b, has a direct model in the form of a decoration that we know from the ancient Peruvian pottery of the last period of the Inca Empire (309). Zoomorphic and anthropomorphic repre-

C Ce 531 532

309. See Max Schmidt: Kunst und Kultur von Peru, p. 349, Fig. 1.

sentations are found relatively infrequently among the decorations on the baked clay vessels. The quadruped shown on the surface

[171]

of the Chiriguano vessel I.A. 347 (cf. Fig. 65 /see p. 130/ and 147 /see p. 211/) and the way in which the road under this animal is represented show many reminders of similar representations of the ancient Peruvians. The representations of animals and people on the surface of vessel I.A. 378 (cf. Figs. 63 /see p. 130 and 146 /see p. 211/), which in external form is quite modern, correspond to those of other South American Indians. Like them the Chiriguano also combine elements of geometrical ornamentation for the representation of zoomorphic or anthropomorphic motifs, for example, the graduated line for the representation of roosters and triangles for the body of women. Cf. Fig. 146 /see p. 211/.

Ce
531

One principal difference between the decoration painted on the surface of the baked clay vessels and the decoration incised on the surface of cuyas lies in the fact that the painting of the baked clay vessel is limited to the decoration of the upper part of the exterior surface or to that of the upper rim of the interior surface of the vessel, that is, the decoration of a continuum, either wider or narrower, while the incisings on the cuyas decorate the entire exterior surface, more or less semiglobular, often making the center of the semiglobular surface the center of the concentric ornamentation.

Among the decorated cuyas I received from the Chiriguano in Machareti some have only incising and others only pyroengraving. But most of them combine these two ways of producing a decoration. Several specimens of these decorated cuyas show the same decorative motifs with a surprising similarity. Without counting the stylized phytomorphic motifs, there can also be found among the incised decorations figures like the representation of a small fish (cf. Fig. 148 /see p. 211/) and of a chapel, clearly identified by a cross. Cf. Figure 153 /see p. 212/.

Among incised decorations we must still mention the concentric circumferences made on the surface of most of the Izozó spindle-whorls and various wooden spindle-whorls of the Chiriguano, and the decoration of the "serere" flute shown in

/82 cont./

Ee 531

Figure 33b, which corresponds, as does also the form of this flute, completely to ancient Peruvian models. Also, the surface of the Chiriguano cane flute I. A. 494 (cf. Fig. 34a /see p. 89/) shows some incisings.

One of the tattooed decorations is shown in a drawing by Nordenskiöld, who found it on a woman's arm (310).

310. Nord. 1, Fig. 108.

Social Conditions among the Chiriguano and Chané

E Ce 114

With regard to the social conditions among the Chiriguano and the Chané-Izozó, I am unable to add to the few data which we know on this subject because the situations in which I found myself when with these Indians were not appropriate for such investigations.

Ce 115 122 126

/83/ Among the Izozó whom I found in Toledo there were some who were designated as cacique. To one of these, who spoke Spanish perfectly, I owe the vocabulary of the Izozó language which I wrote down. I met the Chiriguano only in Machareti, where they had lived for a long time under the supervision of the missionaries and, at the time of my trip, under the chieftainship of one of their own fellows who exercised the functions of a commissioner /comisario/. Two other Chiriguano Indians whom I met in Machareti were identified as caciques.

C 114 197 622

E Ce 129

In order to complete my statements about the Chiriguano and the Chané-Izozó, I must make a resumé of what we know from the literature regarding the social conditions of those Indians, referring to Moreno's statements, which are based on old documents, as well as those of v. Nordenskiöld, which are based upon his own investigations.

Ce 178 648 643 000

Naturally, many of the old Chiriguano and Chané social institutions have been lost since they lost their independence from the whites. Also, the power of the great caciques has diminished appreciably since they have been dependent on the whites. When Nordenskiöld

Ce 178 643 [114] [248]

/83 cont./ when Nordenskiöld made his expedition, there was no longer a great cacique among the Chané on the Parapití River. The last great cacique had been Aringui, whose nephew, Batiraya, was a cacique, but he had refused the position of great cacique because he did not want to be too dependent on the whites (311).

311. Nord. 1, pp. 170 and 233.

C 631 [642]

According to what is said in older documents, the Chiriguano, after their immigration into the Cordillera, did not form a uniform community, a state, in the proper sense of public law. Formerly they had formed a federation of several parcialidades /subdivisions/. In the letter of Licenciado Cepeda (312) in the

C [131] [195]

312. Letter from Licenciado Cepeda giving an account of the war against the Chiriguano under the encomienda of Lorenzo Suarez de Figueroa, Governor of Santa Cruz, and under the Maestre de Campo, Fernando de Cazorra, through Tomina, and under Luis de Fuentes through Tarija. According to Moreno II, p. 113.

year 1585, it is said "that the Province of the Chiriguano, who are in the Cordillera between Santa Cruz and the city of La Plata, who are divided into three parcialidades, each distinct from the others, 25 leagues, although they communicate and help one another. One is the parcialidad of Vitupué, another that of Condorillo, and the other of Chiquiacá."

C 631 643

Of the two parcialidades Vitupué and Chiquiacá we know that they, at least originally, were each under the chieftainship of a great cacique, from whom they received their respective names. Vitupuera was the great cacique of the former and Chiaca the great cacique of the latter (313). With regard to the parcialidad

313. Moreno II, pp. 122 and 126.

631 /83 cont./
[643] of Condorillo, we do not have any evidence as to whether this whole parcialidad was under the chieftainship of a great cacique. We only know that the town of Saigpuru was one of the most important and that it was the most feared by its enemies and that its inhabitants were defeated in the year 1779 by Don Tomás Leso (314).

[175] [027] [632]

314. Moreno II, p. 244.

631 632 643 103 According to the reports written by the Governor of Santa Cruz, Don Lorenzo Suárez de Figueroa, the Province of "Yvytupue," that is, the region governed by the great cacique Vitupuera, was made up of five large subdivisions. As can be assumed from the report cited, these subdivisions were in part made up of one town and in part of several towns and were, with the exception of one, governed by several caciques. Thus there is mentioned in the first place the subdivision "Taquirán and Caracará," probably meaning the towns which bear these names. As the caciques of this first subdivision, three are mentioned; thus the number of caciques does not correspond to the number of towns. Thus, we are not here dealing with a community which was established exclusively on a territorial basis. /84/ For the second subdivision three names are mentioned, Aguapea, Naipea, and Traibi. Thus it was probably made up of three towns. In this subdivision the number of towns, three, corresponds to the number of caciques. The third subdivision is called Tamborá. Thus it can be presumed that it consisted of but one town, and there is also mentioned but one cacique. The fourth subdivision is called Tendy, and three caciques of it are mentioned. It is stated that one of these caciques, called Abaqué, was the son of the cacique Tendy, thus of that cacique who gave his name to that subdivision. Of the fifth subdivision, Ayaguá or Cayaguá, as many as four caciques are mentioned (315).

315. Moreno II, pp. 123 and 124.

/84 cont./

631 [643] Also for the parcialidad of Chiquiacá besides its great cacique, Chiquiacá or Chiacá, 14 other caciques are mentioned, but it cannot be determined from these statements whether these are the names of successive caciques or of contemporaneous ones.

C 175 648 631 We have interesting data from the 16th century on the way in which the individual Chiriguano communities distributed among themselves the different countries in which they were making their depredations. In the "Confesión de Blas Negro," it is said "that to those of the province of caypuru fell the part of tomina, and those of coyagua to the churumatas, and those of tendi as far as misque and tiraque, and those of aguapea up to this road from poxo and santa cruz" (316).

316. Moreno, II, p. 120.

C Ce 175 648 In the historical sketch placed at the beginning of this work, I have already mentioned that the Chané, and also other tribes as well, were subjugated by the Chiriguano and incorporated as subjects into their communities. The Chané communities which C [928] [648] had originally been in Chiriguano territory or its environs had been exterminated, until at the end of the 19th century, when the Chiriguano lost their independence because of the whites, the Chané were emancipated from their oppressors and once more inhabited their separate towns governed by their own great caciques. Ce 175 643 We have an interesting item in the "Comentarios de Alvar Nuñez Cabeza de Vaca" through which we know that the Chané in times past, before being subjugated by the Chiriguano, had a strong social organization and powerful great caciques. In Puerto de Reyes, Alvar Nuñez met a Chané cacique who had previously accompanied García on his return from Peru and later, after the murder of García by the Guaraní, had fled from them. Among other things this cacique declared "that in his land those of his race have a single headman who orders all and who is obeyed by all, and that there are many towns of many peoples of those of ooo his race" (317). The subjugated Chané were distributed among

317. Moreno II, p. 30.

C
Ce /84 cont./ The subjugated Chané were distributed among
175 the various social communities of the Chiriguano as subjects or
648 slaves. In the "Relación del Corregidor de Tomino Don Juan
162 Arce de Alvedia" in the year 1618, it is said that in the Province
[567] of Machareti, "which is Pilcomayo and its environs," there lived scarcely 400 pure Chiriguano, among whom were distributed 5,000 Chané "to one 200, to another 100, to another 60, and in this way up to said number." In the Province of Charaguay 4,000 Chané were distributed in the same manner to the 350 Chiriguano of this province, and upwards of 1,000 Chané to the 200 Chiriguano of the Province of Guapay. As in other documents, in this one as well, there is mentioned the ill treatment which these subjects had to suffer from the Chiriguano and the hate which they had toward their oppressors (318). The Chiriguano

C
Ce
175
648
567

C
Ce
[186]

318. Moreno II, pp. 250 and 104.

scornfully called the Chané "tapií," while they themselves were called /85/ by the latter "cheya," that is, "my master" (319).

319. Moreno II, p. 254.

C
175 Although most of these subjects or slaves were made up of Chané,
648 there were also among them other Indians who had been subjugated
567 in the expeditions, for example, Chicha Indians (320), and among

Ce
[567]
[648]

320. Moreno II, p. 207.

the Chiriguano of Tendi also Guatuco Indians (321). According

321. Moreno II, p. 117.

to Techo (322), whose report was written in the second half of

322. According to Moreno II, pp. 236 and 237.

the 17th century, the Chiriguano customarily sold some of their slaves to the Spaniards.

/85 cont./

648
175

Outside of those subjects incorporated directly into the Chiriguano communities, several tribes of Indians subjugated by the Chiriguano were their tributaries, that is, the tributaries of their individual parcialidades. These tribes had to pay fixed tributes and to lend services as allies in war (323). Such tribu-

323. Moreno II, pp. 121 and 125, 117.

taries of the Chiriguano of the province of Yvytupue were the Tamacocies, the Xores, and the Yurucarés. In the "Carta /letter/ from Don Lorenzo de Figueroa" of the year 1584 it says that the Tamacocies and Xores and Yurucarés had not assisted the Chiriguano of the parcialidad of Vitupue, seeing that they might be defeated by the Spaniards. From this report it can be surmised that as tributaries, they might have been obligated to aid their masters. From the "Confesión del Blas negro," who had lived for a long time as a prisoner among the Chiriguano, we learn what made up the tributes that the three tributary tribes had to pay to the parcialidad of Ybytupue (324). "They

324. Moreno II, pp. 121 and 125.

pay tribute in this way, the Xores poisonous herbs for their arrows, and the Tamacozies, Indian men and women, bows and arrows, and fish and game and macaws, and the Yurucares give them coconuts and turkey feathers and chonta palm for making arrows." Moreover the same source says that the Chiriguano of Tendi and Aparo, Aguapea, and Caripui had contracted with the Chuis-Indians of the town of Mísque to provide them "with powdered saltpeter, stone, sulfur, axes, crowns /coronas/, chipanos, scissors, knives, and other things" (325).

325. Moreno II, p. 121.

/85 cont./

C 631 643 [622] According to all that we learn from the old documents, the Chiriguano communities, that is, the parcialidades under the chieftainship of great caciques and the subdivisions under the chieftainship of ordinary caciques, had a very firm organization in comparison with other tribes of South American Indians. The great cacique commands his subjects and they obey him absolutely. C [177] It is likely that in this regard the example of the absolute rule of the neighboring Incas of Peru influenced the organization of the Chiriguano. C CR 643 631 Even at the time of Erland v. Nordenskiöld's trip in 1908, the Chiriguano and Chané caciques were very powerful in contrast with the caciques of the neighboring tribes of the Chaco. Even at that time there were great caciques, who governed a large territory made up of several towns, and ordinary caciques, who governed the inhabitants of a town or part of them. Thus, at the time of Nordenskiöld's trip most of the towns of the Caipipendi valley were governed by a great cacique named Taruiri. The great cacique Mandepora formerly had considerable power in and near Machareti, and the great cacique Maringay in the Iguembe valley. CR 643 [562] We have Nordenskiöld's interesting statement that women too can be great caciques among the Chané. Thus the great cacique of the Chané towns on the Itiyuru was a woman named Vuáyruyi, who had succeeded her late brother in that office. Because she was already old, she was replaced in her duties by her nephew Vocapoy, who was the eldest son of her brother and predecessor. /86/ Her son was favored as great cacique after Vocapoy (326). Among the Chané on the Itiyuru, and

326. Nord. 1, pp. 223 and 229.

formerly among the Chané of the Parapití when they still had a great cacique, the office of great cacique was tied to a certain family, but it did not pass from father to son. Nordenskiöld recorded the genealogical tree of the family of the caciques of the Chané on the Itiyuru, according to which, after the great cacique Hinu Parava, two of the latter's sons successively succeeded to this office. After the death of the last of these, Hinu Parava's daughter, the above-mentioned Vuáyruyi, was great cacique, while the son

/86 cont./

Ce 643 of her late brother and predecessor, as already mentioned, took her place in her duties. The one predestined for the office of cacique cannot begin his functions if he does not have ability and skill in discussion. The great cacique in the Caipipendi valley was considered incapable because of continual drunkenness, and he was replaced in his functions by one of his relatives (327). In

327. Nord. 1, p. 230.

the Chané towns on the Itiyuru the ordinary caciques too belong to Hinu Parava's family (328).

328. Nord. 1, pp. 170 and 129.

C Ce 643 301 302 293 As a symbol of chieftainship Nordenskiöld observed staffs decorated with silver and the so-called "Yandagua," which consists of a long rod adorned with a tuft of ostrich feathers and is carried by caciques at fiestas and dances. According to Corrado, the caciques formerly wore as a symbol of their office a large lock of hair on top of the head, which they called "yattira," and green stones as pendants in the ear lobes, and at the fiestas, in addition to the "yandagua" mentioned above, the "iguiripe," which was a staff carved with figures (329).

329. Nord. 1, p. 231.

C 756 643 622 At the side of the caciques a special position is held by the sorcerers, among whom the Chiriguano distinguish two kinds, the "ipáye," who are good and who can undo spells, and the "ipáyepótchi," who can undo spells, but who also cast them. The sorcerer is also above all the doctor who has the obligation of curing the sick (330). In general the occupation of sorcerer is separate

330. Nord. 1, p. 216.

from that of cacique. Only in Ivu did Nordenskiöld observe a case where a Chiriguano cacique was a sorcerer at the same time (331).

331. Nord. 1, p. 230.

/86 cont./

The inequalities which formerly existed between the class of the Chiriguano themselves and the class of their subjects, which was for the most part made up of Chané, is no longer important today, since the latter were emancipated at the end of the last century, and they again have their own great caciques and ordinary caciques. Beyond the fact that the family to which the caciques belong has a certain preference (332) today, scarcely

332. Nord. 1, p. 230.

any difference exists today among the members of the same Chiriguano community with respect to their economy. But such a difference indeed exists among the various communities themselves, depending on the conditions of production in the different places. Also today, since the emancipation of the Chané, the work is distributed, more or less equally among the members of the community of the same sex. The great cacique and his wife take part in communal labor. Only a few Indians are exempt from this rule, and they are those who have accommodated themselves to the modern situation and send members of their own tribe to work as servants (333).

333. Nord. 1, p. 231.

Inequality of practical importance exists almost solely between the two sexes, and especially with regard to the distribution of labor. With regard to the supplying of /87/ necessities, this inequality between the sexes does not appear, but only in the fact that the men and the women eat apart and the men in general eat first and women and children later (334). Nordenskiöld has

334. Nord. 1, p. 189.

made up an exact scheme of the distribution of labor between men and women (335) /there is no footnote bearing this number/. According to this scheme, the following work is apportioned only to men: hunting, plaiting and clearing, woodworking, twisting

/87 cont./

462 rope, making nets, plaiting mats and baskets, leatherwork, the manufacture of weapons, the decoration of cuyas and calabashes, and the building of houses. Only the following work is apportioned to women: carrying water, cooking, making fermented beverages, gathering fruits and roots, ceramics, making hammocks, spinning, and plaiting bands. The following work is apportioned to both sexes: fishing, with the difference that the women catch small fish in shallow water, while the men fish in deep water, planting and harvesting, cooking -- attributed in the preceding to the women -- in that men at times participate in the preparation of game, fetching firewood, which on most occasions is men's work, but among the Chané on the Pacapirí River women's as well, the raising of domestic animals, sewing and weaving, in that in some regions men also weave, although in general weaving is women's work. Children also participate, depending on their sex, in the respective work of their parents, particularly in the harvest (336) /there is no footnote bearing this number/, and in this way seeing and imitating, they learn from a very early age the work that they must do in later life.

I have already mentioned in the chapter on towns and houses that Chiriguano towns were formerly made up of only a few houses, each of them inhabited by up to 100 persons. Today, as a general rule, only one family lives in each house, but often together with the husbands of the daughters, who live for a time before the nuptials and also during the first part of the marriage in the house of the mother-in-law (337). The Chiriguano clean

337. Nord. I, p. 176.

a piece of ground for his daughter, one which the son-in-law can work, doing the planting and harvesting (338).

338. Métraux I, p. 345.

/87 cont./

The girl is mobile when, after the first menstruation, she has undergone a certain ceremony, which lasts until her hair, cut short, has grown out again to medium length. This ceremony of the girls, which is called "yimundia," consists of her being put in a kind of separate room inside the house. Until the following menstruation, she must stay on a diet and she must not eat anything but cooked maize and meal (339). Only in the

339. Métraux I, p. 320, note 3.

company of her mother may she temporarily leave the separate room to bathe and to take care of her other needs (340).

340. Nord. 1, p. 210.

We also learn from Nordenskiöld that the Chané boys from 10 to 12 years of age must also undergo certain ceremonies, which consist in having a man who is particularly expert in such matters pierce the lower lip (341) and put a small stick through the hole.

341. According to Métraux I, pp. 346 and 347 and Fig. 12, the Chiriguano formerly used for that purpose punches made of horn.

and his grandfather puts deep wounds in his body so that he may be valiant in battle and in hunting and takes him out in the morning, when it is cold, to bathe (342).

342. Nord. 1, p. 211.

Chiriguano and Chané girls are watched over by their mothers /88/ until their marriage (343), and illegitimate children are

343. Nord. 1, p. 172.

C Ce 887 848

/88 cont./

rarely born (344). Marriages are made among the Chané by a

Ce 583 584

344. Nord. 1. p. 207.

method whereby the young man who wishes to marry sends several pieces of game to the girl's parents. He puts firewood in front of her house, and, if it is used, this signifies consent. But only after having worked for one year for his future mother-in-law can he marry the girl. The night before the wedding, which is celebrated by drinking a good amount of chicha, the young man sleeps with the girl (345).

Ce 585

345. Nord. 1. pp. 211 and 212.

Ce 595 643 622

While young men have but one wife, older men, and particularly caciques, often have several wives. Thus the substitute great cacique on the Itiyuru had four wives, who lived in different towns, and the cacique Maringay had two wives, who lived together (346). Marriage between brother and sister is prohibited.

C Ce 582

346. Nord. 1. pp. 212 and 213.

while cousins may marry (347).

347. Nord. 1. p. 212.

Ce 843

Certain foods are forbidden to the pregnant woman. Thus, among the Chané on the Itiyuru a pregnant woman cannot eat doves. But they do their work until they give birth (348). After

Ce [1461] Ce 846

348. Nord. 1. p. 206.

a child has been born, the man must go through the "couvade," which means that he must remain lying down for several days and must stay on a certain diet. Among the Chané on the Parapití : : for the first few days he may eat only cooked maize and maize soup,

Ce /88 cont./
846 but no meat (349). Later he can eat sweet potatoes. When the

Ce
553
551
603

349. See Métraux I, p. 320, note 3.

baby begins to walk, he is given one name at most, not by his parents, but by his grandparents. Nicknames are often added to
Ce the proper name later (350). Orphans are brought up by their
736

350. Nord. 1, p. 208.

relatives (351).

351. Nord. 1, p. 210.

C From the time they first immigrated to the Sierra de la
721 Cordillera, the Chiriguano, that is, their parcialidades, made war or attacks on the neighboring Indian tribes or the Spaniards. In the historical sketch placed at the beginning of this work, I have described these hostilities in broad outline. Their weapons
C of war were bows and arrows and the club. The caciques were
[411] also war chiefs. According to what one Chané cacique told
[701] Nordenskiöld, these Indians formerly had the custom of bringing
[727] home the heads of their dead enemies and of showing them during the fiestas in the town square (352). The Chiriguano capacity

C
195
721

352. Nord. 1, p. 172.

for war was still recognized by the Spaniards in the 16th century. In the "Declaración de Sebastián Pérez Chamoso" in 1571, it is said of them: "With the inventions and tricks and mode of war that they have, they have done and are doing said damages unto the Spaniards, Indians, and workers that are in the said fields" (353).

353. Moreno II, p. 107.

C Before the Chiriguano launched their attack upon King Guacane,
726 they reconnoitered with spies the Llanos of Grigota where the

726 /88 cont./
712 King was (354). Their towns, described in the preceding, were

354. Moreno II, p. 87.

175 fortified by blockades, in addition to their natural position. Ruiz
212 Diaz de Guzman on his expedition against the Chiriguano found
248 a town near the Pilcomayo which was fortified by two concentric blockades of stone and wood (355). We find interesting data

355. Moreno II, p. 252.

about the fortifications that the Chiriguano made during their wars in the "Relación y breve noticia de lo sucedido en la guerra de Chiriguanos que se ha hecho este año de 1729 por orden /89/ del señor Virrey y Real Audiencia de Chuquisaca por el Padre Bartholomé de Mora /Report and brief note on what happened in the Chiriguano war that took place in this year of 1729 by order of the Lord Viceroy and Royal Audiencia of Chuquisaca by Father Bartolomé de Mora/" (356). These fortifications are described

[113]

356. Unpublished /inedito/ manuscript published /publicado/ by Professor A. Posnansky with an introduction and notes by Dr. A. Métraux. (Revista del Instituto de Etnologia de la Universidad de Tucuman, Vol. II, No. 1, p. 126.)

in the following way: "Continuing on their way (the Spaniards and Chiquitos), now by the light of day, at about a league they found blocking the way a very strong and well placed trench with very heavy stakes stuck in the ground, which, hewn like planks, had loopholes through which they shot arrows. Here considerable resistance was met, because the trench was very well fortified and the Indians who defended it were numerous." In another place it says: "They went on, all now being together, and they arrived at the place where the enemies had fortified themselves.... The fort was a ravine cut like a wall, which had

C 173 712 648 /89 cont./

only one way up, very narrow and steep, which, sown with thorny branches, made it more impenetrable. On the eminence of which they had entrenched the gate with stakes stuck into the ground."

Ce 178 648 721 Today the Chiriguano and Chané no longer make war upon other Indians, aside from the fact that the Chané on the Parapití occasionally go on expeditions against the Tsirakua Indians (357).

357. Nord. 1, p. 171.

Law

Ce 671 177 178 Because the white authorities intervene more and more in the original, juridical traditions of the Chiriguano and Chané, many of them no longer exist today and also, from the few data which Nordenskiöld gives regarding this matter as of 30 years ago, many do not now correspond to the facts.

Ce 627 With regard to penal law, we find among these Indians a mixture between the principle of the "vendetta" and the practice of penal law. Among the Chané on the Parapití, most crimes, and robbery in particular, were settled by means of the duel. Ce [685] In the case of theft, the one who has stolen and the one who has been robbed appear, each with his relatives, in the town square to fight each other. Only homicide, the seduction of a woman, Ce 607 642 68 and sorcery were decided by the great cacique as judge. Homicide, which formerly occurred among the Chané in the form of poisoning with poisoned chicha ("bád dyási"), and sorcery were punished by the burning of the criminal. The seducer of a woman lost his property (358). According to statements of the substitute great

358. Nord. 1, p. 232.

cacique of the Chané on the Itiyuru, it was the principal obligation of the cacique to avoid the vendetta by sending criminals to another region so that they would not be killed. Thus thieves, after having received 50 lashes, were sent to another town. A murderer was condemned to work up to half a year for the family

Ce 692 643 68 /89 cont./
of the deceased (359).

359. Nord. 1, p. 231.

C 421 Private property is highly respected among the Chiriguano. According to Métraux, even the closest relatives cannot make use of the property of one of them without his consent. The C 423 possession of a piece of land is guaranteed to a Chiriguano by planting any plant on it or by clearing the circumference of the land required and making large slashes in the trees. When he selects a plot for his planting, the Chiriguano examines it carefully to determine that there are no traces of a previous planting (360).

360. Métraux I, pp. 334 and 340.

C 241 476 [622] After the land selected for the planting has been cleared, relatives and friends are called together to help with the work. Formerly, the cacique of the town also took part by keeping watch for the workers (361).

Religion

C Ce 797 771 178 538 In their many years of activity the missions have naturally influenced notably the religious notions of the Chiriguano and Chané. Most of them today are Christians. Some still retain part of their primordial ideas, expressed in their legends. I shall limit myself here to referring the reader again to the Chané legends taken down by Nordenskiöld (362) and mentioned several times in the Preceding.

362. Nord. 1, pp. 251-296.

The Language

C
Ce
197 I have already mentioned above that the Chané originally spoke a language different from that of the Chiriguano, but that during the long period of their captivity they adopted the latter's
Ce 198 language. A cacique of the Chané of the Parapití, named Batirayu, told Nordenskiöld that some of the Chané still knew a few words of their original language and that today it had the
Ce 195 nature of a secret language. .Thus there are still often employed invectives of the original Chané language, such as "karitimisóyti," which the Indians translated as equivalent to "son of a whore."
Ce 533 197 Songs in the original language can also be found for example, "siparakinánoye, siparakinánoye, siparakinánoye, tonéya, tonéya, tonéya, tonéya," which they cannot translate, however.
Ce 114 197 Nordenskiöld, with much effort and patience, was able to take down six words of the original Chané language in the town of Huirapembe on the Parapití, where a few Chané Indians who still knew their original language were said to be living. From
Ce [194] the comparison of these six words with the corresponding words of the Mojo language, a great similarity was apparent; thus there can be no doubt /91/ but that the Chané originally belonged to the Aruaco /Arawak/ linguistic group (366).

Vocabularies of the Chiriguano of Machareti and of the Izozó of the Parapití River

Notes on the Alphabet of the Vocabularies

In publishing below the Chiriguano and Izozó vocabularies which I took down in Machareti (Chiriguano) and Toledo (Izozó), I use the same alphabet as in my previous publication on the vocabulary of the Guarayú language in this same journal (Vol. III, No. 6).

Vowels

a; e; i; o; u. : long vowels.
a; e; i; o; u. : short vowels.
ã; ẽ; ĩ; õ; ũ. : nasal vowels.
ɨ : gutteral vowel (as in Guaraní and agua).
è = ä in German (as in: Bär = bear).
ü = ü in German (as in: Übel = bad).
ai; au; oi are dipthongs.
au = au in German (as in: Auge = eye).
oi = eu in German (as in: Teufel = devil).
aĩ is a nasal dipthong.

The apostrophe after a vowel (a'i; a'u; o'i) indicates that it does not form a dipthong with the following vowel.

Consonants

The consonants used in the Chiriguano and Izozó vocabularies are the following:

b; d; (f is not used); g = g in German (as in Garten = garden); h is always aspirated as in Guaraní; j = j in Spanish (as in jabón); k; (l is not used) m; n; p; r; s = c in Spanish before i (as in cielo); t; v = w in German (as in Wagen = cart); y = y in New York, is exclusively used as a consonant; z = z in French; ch corresponds to the ch in Spanish; sh = j in French, as in je = I).

The accented syllable of the vowels is indicated by means of the acute accent. /The word list, pp. 92-111, and the bibliography, pp. 111-115, are omitted in the translation; see the foreign text./

413

/For information on the various types of spindles in use among the Chiriguano and Chane Indians, see category 283./

175
648

/Since Métraux believes that the Chiriguano are actually descendants of the Guarani, data in this source which have been specifically subheaded for the Guarani file, in regard to culture contacts and foreign relations, may equally apply to the Chiriguano. The researcher is therefore advised to consult text category 116, pp. 6-25 for this additional data./

Los Chiriguanos e Izozós

POR EL

PROF. DR. MAX SCHMIDT

INTRODUCCIÓN

Conociendo personalmente por mis precedentes viajes cientificos solo a las tribus indigenas de Matto-Groso (Brasil), acepté con mucho placer la proposición de la Sociedad Cientifica del Paraguay de visitar a los indios del Chaco Paraguayo y como fuera apoyado ámpliamente el pensamiento por el Comando del Chaco, doy gracias por su apoyo a la Sociedad Cientifica del Paraguay, al Jefe del Comando del Chaco Paraguayo, a los Jefes de etapas y a todos los otros cooperadores de mi expedición. Especialmente agradezco a S. E. Reverendisima, el Señor Arzobispo de Asunción, Don Juan Sinforiano Bogarin por las presentaciones que hiciera a mi favor ante los padres Oblatos de Maria Inmaculada, cuya misión se halla proxima a fortín Esteros, cerca del Rio Pilcomayo.

Salí de Asunción el 7 de Agosto del año 1935 y pasando el fortín López de Filippis (Chaco Paraguayo), llegé el 15 de Agosto al fortín Toledo, donde hallé a un gran numero de indios Izozó, que habian dejado sus habitaciones en el valle del Parapití por haber sido trasladados provisoriamente a las cercanias de Toledo y del fortín « 15 de Agosto ».

Además, de mis estudios etnológicos y de las preparaciones para el viaje futuro, atendí a la comisión de la Cruz Roja Paraguaya de repartir trajes, generos y lana entre los indios Izozós que a la sazón estaban muy necesitados. Proveido por el Comando del Chaco en fortín López de Filippis de dos camiones, con choferes y ayudantes y de los viveres necesarios, prosegui el viaje el 26 de Agosto, con rumbo al Rio Pilcomayo. Más allá de Corrales nos encontramos con los primeros indios: Eran los Churupís. También en Moreno, que alcanzamos por la tarde, casi ya de noche, estaban presentes algunos Churupís, que se habian trasladado desde Muños hasta aqui. El 27 de Agosto llegé a la misión de los padres Oblatos de María Inmaculada, cerca del fortín Esteros, donde los padres me recibieron de la manera más amistosa y prestaron su apoyo más extenso a mis estudios de los indios Churupís, domiciliados en la misión o cerca de ella. Me dieron una grande colección etnológica de objetos de los indios Churupís que regalaron al Museo de Historia y Etnografía de la Sociedad Cientifica del Paraguay. Habiendo visitado también a los indios Churupís en la misión cerca de la Laguna Escalante, distante de la misión de Esteros más o menos 25 kilometros, prosegui el viaje el 5 de Septiembre hasta Linares, donde hallé bastante indios Matacos, que en parte vivian en un pueblo distante unos 7 kilometros de Linares y parte pasaron del otro lado del Rio Pilcomayo, a Linares.

Salí el 9 de Septiembre de Linares, llegé el día siguiente a Guachalla, de donde yo visité una tolderia de los Churupís distante más o menos 7 kilometros.

El 11 de Septiembre salí de Guachalla, al fortín Cururenda, en donde tuve ocación de conocer a los indios Chorotes, que vivian en una tolderia distante unos 3 kilometros de Cururenda y a algunos Tobas y Matacos, que venian del otro borde del Rio Pilcomayo a Cururenda.

El 15 de Septiembre proseguí el viaje hasta Oruro en cuyas cercanias vivian los Tapietés. Mi acompañante el Teniente Cabello, que conocia bien a estos indios, me llevó a sus dos tolterias, de las cuales la una distante 15 y la otra 32 kilometros de Oruro.

El 19 de Septiembre salí de Oruro, y pasando por Capirendá y Carandayty llegué en compañia del Teniente Diego Corvalan, a Machareti, en donde permanecí desde el 21 al 25 de Septiembre. Siendo Machareti un pueblo de los Chiriguanos tuve en este lugar, y al fin de mi viaje, una buena ocasión de conocer a esta interesante tribu de indios.

Principiando mi regreso el 25 de Septiembre, pasé sucesivamente por Capirendá, Carandayty, López de Filippis y Puerto Casado llegando a Asunción al 8 de Octubre.

Gracias al grande apoyo de los autoridades militares tuve la posibilidad de atravesar durante el tiempo relativamente corto de dos meses, grandes regiones del Chaco Paraguayo; de conocer un gran numero de tribus indigenas del Chaco; de hacer fotografias de estas tribus y de confeccionar vocabularios de sus diferentes idiomas. Fuera de los Tobas, con los cuales yo no me encontré, sino pasando, conocí en este viaje a los Chiriguanos y a los Izozós, que hablan como aquellos, un dialecto de la lengua Guaraní; a los Tapietés, Churupís, Matacos, y Chorotes. Todas estas tribus de indios no son desconocidas en la literatura etnológica. Sobre la Historia de los Chiriguanos estamos orientados por medio de documentos antiguos hasta desde los primeros tiempos de la conquista española y debemos a los misioneros Franciscanos, que han enseñado entre ellos por mucho tiempo, publicaciones etnológicas bastante importantes. Los Churupís han sido estudiados minuciosamente con el nombre Ashluslay por Erland Nordenskiöld, y los Oblatos de María Inmaculada en Esteros y Laguna Escalante procuran intensivamente hacer investigaciones etnológicas. Yo me he propuesto de tratar a todas estas tribus sistematicamente. Esta revista se hará a base de los resultados de mi viaje y principio en esta primera publicación con los Chiriguanos o Izozós.

GENERALIDADES

Como ya dije en la introducción de este trabajo, conocí a los Chiriguanos en Machareti y a los Izozós en las cercanias del fortín Toledo y en el fortín «15 de Agosto», distante algunos kilómetros de aquellos.

La figura 1 da una vista de Machareti, pueblo de los Chiriguanos creado en su forma actual por la misión de los Franciscanos. Cuando el Ejército Paraguayo retomó a Machareti, ya había sido abandonado por los Padres y ahora un Chiriguano en su carácter de comisario, es jefe del pueblo, existiendo también algunos caciques. Las casas, más o menos en la forma de ranchos modernos (comp. fig. 14 y 15) están a los dos lados de anchas calles, que corren paralelas y rectangulares como en la mayor parte de los pueblos de las colonias antiguas de los Españoles. Cuando yo estuve presente en Machareti existia grande caren-

cia entre esos indios, por causa de la grande seca que dejaba sin resultado sus plantaciones que estaban algo distantes del pueblo. Al lado de los ranchos se encuentran muchas veces depósitos que eran construcciones de casas indígenas hechas encima de palos. Aunque muchas costumbres primordiales de los Chiriguanos se han perdido por causa de la influencia de las misiones, se han conservado, no obstante, muchos objetos indígenas como para poder juntar entre estos indios una colección etnológica relativamente completa.

Los Izozós, habiendo abandonado durante la guerra del Chaco sus domicilios en las regiones del bajo Rio Parapiti, habian sido trasladados provisoriamente a las cercanías del fortín Toledo y al fortín «15 de Agosto» donde vivian en los ranchos abandonados por los soldados. Ellos habian rozado en las cercanías de los fortines grandes terrenos para sus plantaciones, pero también ellos por causa de la grande seca, no tuvieron ocasión de plantar, así que una parte de ellos ya habia vuelto a las regiones del Oeste cuando yo estuve en esos fortines. Al comenzar mi regreso de Machareti, una grande parte de ellos estaba cerca del fortín Carandayty. Según los datos que me comunicaron amablemente las autoridades militares de Toledo, el número de los Izozós que habian llegado hasta el 30 de Junio de 1935 a Toledo y «15 de Agosto» ascendió a 1647 mayores, 724 menores y 122 criaturas de pecho, total a 2493 almas. El 24 de Agosto, al fin de mi estada en Toledo, estaban en este fortín y en «15 de Agosto», solamente 503 mayores, 141 menores y 26 criaturas de pecho habiendo vuelto en esa fecha la mayor parte de ellos al Oeste.

Esos indios Izozós que hablan su dialecto de la lengua Guaraní, rechazan con indignación el nombre de Chiriguano. Dicen que son Guaraníes y Paraguayos y su nombre es el de Izozó. Hasta ahora no conocí en la literatura etnológica este nombre y él también no aparece en la obra de Moreno: «Cuestión de Límites con Bolivia». Tomo II. Solamente en el mapa de Bolivia trazado por el ingeniero Franz Germann (Hamburg 1904) está apuntado entre el Rio Grande y el Rio Parapiti el nombre «Izozéos». Los Izozós, cerca de Toledo, me dijeron que sus domicilios estaban en la región de los esteros del bajo Parapiti. Rechazando esos indios no sólo el nombre de Chiriguanos, sino que también el nombre de Chané o Tapyi no se pudo averiguar de sus indicaciones con què tribu conocida en la etnología pueden ser identificados. Los Chiriguanos se llaman a sí mismos «Mbya». Si los Izozós fueses una parte de ellos, se habian llamado con ese nombre. Sin duda ellos son Chanés y aquella parte de estos que tenian sus domicilios en la región del Rio Izozó, aceptando el nombre de este rio por su propio. Su cultura como lo demuestran los objetos coleccionados por mi entre ellos, afirma esta opinión. Existen algunas diferencias entre los objetos coleccionados entre los Izozós y los Chiriguanos en Machareti, sea por lo que se refiere a los ornamentos de las vasijas de barro cocido, o, a la fabricación de las redes. Pero desde un principio no se puede decidir, si estas diferencias no sean solamente diferencias locales. Por lo general, la cultura de los Chiriguanos se difundió de este modo por entero con la de las tribus sucesivamente sometidas por ellos, por lo que conviene tratar también a continuación los aspectos de la cultura de los Chiriguanos de Machareti, junto con la de los Izozós.

INFLUJOS DE LA CULTURA DE LOS CHIRIGUANOS E IZOZÓS SACADOS DE DATOS HISTÓRICOS.

Los Chiriguanos y Chanés forman al presente una entidad de cultura que se puede significar como cultura de los Chiriguanos, porque la lengua Guaraní de los Chiriguanos llegó a ser la lengua común de todo el grupo. También los Izozós pertenecen a esta entidad étnica. Así que hay que considerar a esta enti-

8: Schmidt SF10 Chiriguano

dad como formada por tribus completamente diferentes. También hay que concebir su cultura como el producto de la fusión de elementos culturales muy heterogéneos. Nordenskiöld trata en uno de sus libros (1) esta cuestión y divide (2) la suma de elementos culturales de los Chiriguanos en diferentes categorías según que los recibieron de los blancos, o de la cultura de los Peruanos antiguos, o de los Matacos, Tobas y otras tribus del Chaco; o tienen en común con las tribus del Norte y del Este perteneciendo a estos también aquellos que habían llevado con sigo de sus domicilios primordiales entre el Río Paraná y el Río Paraguay. Encontraremos en lo sucesivo muchas veces este asunto, y como estos influjos de cultura han sucedido en tiempos históricos y nosotros conocemos la historia de los Chiriguanos por medio de los documentos existentes desde los primeros tiempos de la conquista española, quiero tratar en lo que sigue, el resumen de estos datos históricos en cuanto que han influido en el desarrollo cultural de los Chiriguanos y Chanés.

Ya en una de mis anteriores publicaciones hecha en esta revista, titulada: «Los Guarayú», encontré el punto en discusión, a saber: si la primera inmigración de los Guaranies en las regiones al Oeste del Chaco Paraguayo sucedió en tiempos anteriores a la expedición del Portugués Alejo Garcia hacia el Perú o tuvo lugar después de ese tiempo. En aquella publicación entonces deduje que se puede suponer que antes de la expedición de Alejo Garcia no habían existido Guaranies en las regiones del Oeste del Chaco Paraguayo, porque ningún autor menciona que Garcia acompañado por muchos Guaranies hubiese encontrado en aquellas regiones a otros Guaranies. Con esta opinión de que la inmigración de los Guaranies al Oeste haya sucedido después de la expedición de Garcia, fundada principalmente en las indicaciones de Guzmán, concuerdan también las opiniones de Manuel Domínguez y Erland Nordenskiöld. Esa cuestión de la invasión de los Guaranies al Oeste del Chaco Paraguayo es tratado detenidamente también por Fulgencio R. Moreno en su obra: Cuestión de límites con Bolivia. (3) En ese lugar (4) se reproduce un documento que, yo creo, sirve para aclarar este punto muy discutido. Es la relación que el P. Alcaya, Cura de Mataca, escribió para el Virrey del Perú, Marqués de Montes Claros. Esa relación dice, que el Inca en el Perú ya antes que viniesen los Españoles al Paraguay, dio comisión a un descendiente suyo, llamado Guacane para que conquistase los Llanos de Grigota. La empresa de Guacane tuvo un buen éxito, sobre todo por haber sido recibido bien por el gran cacique Grigota, que dominaba sobre esta provincia. Con ayuda de su hermano Condori enviado detrás de él y a quien fué encargada la explotación de las minas de Aypurun, consiguió mucho oro y plata en el país. Los indígenas le respetaban y él los ocupaba en labrar chacras de maiz y ayudabales en la caza. Por medio de los indios de los Llanos, la fama de las riquezas de los hermanos Guacane y Condori llegó a los oídos de los Guaranies en el Paraguay que se alistaron en número de ocho mil indios, y en tres divisiones vinieron, con sus mujeres e hijos, de los Xarayes hacia el Oeste. De los 8000 Guaranies se quedaron 1000 en la provincia de Itatim, 2000 marcharon contra el Inca Mango, y fueron exterminados hasta ser reducidos a pocos por los Peruanos. La división más grande, de 5000 indios, marchó primero a la región de Santa Cruz de la Sierra y allí sojuzgaron a la gente humilde y poco belicosa de aquella parte.

Allí se detuvieron un invierno, desde donde enviaban a sus mujeres a los Llanos de Chiquito donde el Rey Guaraní sin ningún cuidado se holgaba con las mujeres. Inesperadamente una noche, los Guaraníes sorprendieron al Rey y a las mujeres que eran más de 30.000 indios y mataron muchos, entre ellos también el Rey Guaraní Grigoria, el presidente gobernador de ese país, salió mal herido. De allí los victoriosos Guaraníes tomaron la vía hasta la cordillera donde Cendoti, hermano del Rey muerto, explotaba las minas. Dejando sus mujeres y criaturas con una guardia al pié de la cordillera, subieron al cerro y otra noche asaltaron a los mineros y prendieron al Capitán Cendoti. Los fortalezas de Guasacuenga y de Sevayuatia, los Guaraníes los encontraron abandonados por sus guarniciones. En Sevayuatia, ellos encontraron solamente a las mujeres de los Incas a las que llevaron con sigo como presas. También encontraron mucho oro en el cerro de Ayparos. Después de este éxito, los Guaraníes se establecieron en la cordillera, donde permanecieron también en el tiempo siguiente. Otra victoria la ganaron los Guaraníes contra los Peruanos, venciendo al Capitán Lozana a quien el Inca había encargado fortificar de nuevo el Cerro de Ayparos. Los Guaraníes salieron al encuentro de los Peruanos y a pura distancia, los desbarataron y mataron más de 2.000 de ellos, pero después [illegible] los Peruanos habían terminado. Retirándose a su estancia, encima de la Cordillera, los indios cercados por Grigoria los preparaban una sorpresa que se realizó con tanto éxito. 300 Guaraníes quedaron muertos y 300 capaces prisioneros los cuales conducidos al Cerro fueron condenados por el Inca a subir en las escarpadas cimas de las Andes la muerte de frío.

La relación del P. Alonso Gaso merece interés porque ella nos dá dos indicios importantes para la primera inmigración de los Guaraníes. La relación sobre la muerte del Rey Guaraní, Cacifornes Alvar Nuñez, este Rey vivía todavía cuando Alejo García volvió de su expedición al Perú. (5) Así, pues, las conclusiones entre los Peruanos y los Guaraníes, descriptas en la relación del P. Alonso y el establecimiento de los Guaraníes encima de la cordillera, deben haber sucedido después de la expedición de García. Una indicación más segura nos dá indirectamente un pasaje de la relación que menciona el nombre «Mango Inga». (6) En aquel lugar se dice lo siguiente: Los Xarayes «los dieron más cinco estilla de las minas, y los mostraron muchas de plata y aquillas de plata para sus armas, que el Rey Guaraní les había enviado desde Grigoria, que hay cinco leguas cercanas, y también les dieron estilla cierta de Mango Inga, el cual no durmió en su nueva conquista por hacia el Norte y Grimaia, cercando y atravesando la Gerra cercano «Mas quieren». Mango Inga era el sucesor legítimo del Inca Huaraní, sucedido por su hermano Atahualpa, a quien Pizarro a sus pedidos ayudaba para realizar sus pretensiones al trono y junto con quien él entraba el 15 de Noviembre de 1533 a la capital de los Incas. Este Inca Manco murió después de sus violentas conclusiones con los Españoles en el año de 1544. Conforme a esa, las conclusiones entre los Peruanos y los Guaraníes y el establecimiento primero de los Guaraníes en las cumbres de la Cordillera al Oeste del Chaco Paraguayo, que se correspondieron con esas conclusiones, deben haber sucedido entre 1533 y 1544, y probablemente en el principio de este espacio de tiempo, porque los últimos años de la vida del Inca Manco eran absorbidos mucho con sus conclusiones contra los Españoles. Según la opinión del Dr. Manuel Domínguez, (7) la expedición de García tuvo lugar entre 1524 y 1526. Con eso está muy de acuerdo que los Guaraníes, que habían conocido por la expedición de García los riquezas del Perú y hacía de ese habían recibido noticias de las riquezas del país de los Incas

Nota 5. Manuel D. p. 90.
Nota 6. Manuel D. p. 90.

Guacane y Condori por los indios de los Llanos, se resolvieron más o menos 10 años más tarde a emigrar en gran número, en compañía con sus mujeres e hijos hacia esta tierra rica. Así pues tenemos que fijar el primer establecimiento de los Guaranies en las regiones al Oeste del Chaco Paraguayo en tiempos posteriores a la expedición de García. Pero es posible que en el intervalo y talvez también antes de la expedición de García, los Guaranies hayan hecho correrías más pequeñas a las regiones del Oeste, «a la tierra a dentro» como dice la relación de Alvar Núñez Cabeza de Vaca. Sin duda se trata de una de esas correrías en la descripción que hizo un Guaraní que había vivido entre los Charayes, a Alvar Núñez. Los indios de su generación, quiere decir, los Guaranies de Itatí «hicieron gran llamamiento y junta de indios de toda la tierra, y pasaron a la tierra y población de la tierra adentro.» Ellos hicieron guerra a los indios de esta tierra y les tomaron las planchas y joyas que tenían de oro y plata, despoblaron muchos pueblos y mataron muchos indios. Pero luego se juntaron sus adversarios, les alcanzaron en gran número y los mataron casi todos. El resto huyó «a los montes» (8). Al sexto día de su partida de Xarayes, Alvar Núñez se encuentra con algunos de esos indios, los que después de su derrota, habían huido a los desiertos. Algunos hombres de ellos, cuya edad Alvar Núñez calculaba en 35 años, manifestaron que nada podían informar sobre el camino, que siguieron entonces los Guaranies en su correría, porque eran en aquel tiempo muy pequeños. Conforme esta indicación tenemos que suponer que esta correría fracasada por los Guaranies al Oeste, haya tenido lugar bastante tiempo antes de la expedición de Alvar Núñez, la cual tuvo lugar en el año de 1543. Entre la expedición de Alvar Núñez y la expedición del Portugués Alejo García, que según Dr. M. Domínguez tuvo lugar entre 1524 y 1526, quedan más o menos 20 años y Alvar Núñez podía solamente calcular la edad de esos indios que dijeron era muy pequeños tolaria en el tiempo de la dicha correría. Así pues, esta correría pudo haber tenido lugar, conforme se afirma en esas indicaciones basadas sobre la edad de los indios, sea antes o después de la expedición de García. Pero, en todo caso, no se trata con esta correría de aquella grande expedición de los Guaranies contra Guacane y su hermano Condori, pues se cuenta en el documento citado, que estos Guaranies después de sus victoriosos combates contra Guacane y Condori, se establecieron «cerca de la Sierra, donde quedaron también después de su derrota por Grigota, llamados en lo sucesivo por los Peruanos con el nombre de Chiriguanos. Los Guaranies que hicieron la correría de que refiere Alvar Núñez fueron exterminados casi todos por sus enemigos que eran probablemente indios del Chaco, y solamente algunos restos de ellos compuesto salvándose en los desiertos por donde habían pasado antes.

Irala recibió, en el puerto de los Reyes, de un cacique de los Chanés que hablaba Guaraní, la noticia «que en tiempos pasados, antes que García viniese, del Brasil a los dichos guaranís, se hizo una gran junta de los dichos Guaranies en el puerto que llamo de Itatín para ir a beneficiar el metal.» (9) En esta ocasión los Guaranies pasaron las tierras de los Chanés y destruyeron sus casas. También en esta indicación del cacique de los Chanés no se dice nada sobre un establecimiento permanente de los Guaranies al Oeste. Más bien se dice que los Guaranies quisieron «beneficiar» el metal. Pues se trata también aquí de una comisión de los Guaranies.

Las expediciones y emigraciones de los Guaranies descritas en lo que precede estaban ya desde el principio en conexión con choques hostiles con los diversos indígenas de las tierras recorridas. En todas las regiones donde los Guaranies se encontraron con los otros indios, ellos les devastaron sus tolderías

(8) Alvar Núñez Cabeza de Vaca: Comentarios, Madrid, 1906, p. 67. Alvar Núñez Cabeza de Vaca: Comentarios, Madrid, 1906, p. 146, 147 y 153.
(9) Alvar Núñez Cabeza de Vaca: Comentarios, Madrid, 1906, p. 67.

y llevaban consigo como esclavos a todos los habitantes que no fueron muertos en los combates. Eran enemigos de todos y odiados por todos. Sobre todo los Chanés descritos como pacificos y poco belicosos sufrieron sus violencias. Cuando los Guaranies, que habian emigrado al Oeste, despuès de su derrota por Grigota, se habian establecido permanentemente encima de la Cordillera continuaron derrotando a los indios de vecindad y sobre todo a los de los Llanos y llevaron con sigo muchos de ellos como esclavos, para que les serviesen como auxiliares en sus otras correrias. Cuando Nuflo de Chaves llegó a la Cordillera, los Chiriguanos venian de hacer guerrra a los indios de Poxo o de Misque, pero Nuflo de Chaves les estorbó la venida y hizo dejarse de las hostilidades con aquellos indios y los otros de la frontera. (10) El año de 1560 las violencias de los Chiriguanos contra las tribus de su vecindad hicieron al Virrey de Perú mandar al Capitàn Andrés Manso a esa región para que fundara un pueblo en ella, estableciendo una valla a las incursiones de estos indios. (11) La relación del Corregidor de Tomina, Don Juan Arce Alvendin, del año 1618, nos refiere que los Chiriguanos al principio vivieron en amistad con Andrés Manso, pero más tarde aconsejaron a los Chanés pacificados por Manso, que se rebelasen contra los Españoles, y mataron al Capitán Manso y a los demás Españoles, del nuevo pueblo. Ellos se apoderaron de la tierra sujetando a los Chanés y haciendolos servir como esclavos. En la declaración de Sebastian Perez Chamoso, del año 1571, (12) son mencionadas las violencias de los Chiriguanos contra los indios Yanaconas y Chichas y se dice que ellos llevaron indios Chichas como esclavos. El Auto de la Real Audiencia en que se toma resolución de la guerra que se ha de hacer a los Chiriguanos en el año 1583, menciona entre muchos otros desafueros de los Chiriguanos también aquél que han usurpado y devastado las tierras de los Llanos e indios Chanés. (13) Esclavizando continuamente a los indios de las Tribus sometidas, los Chiriguanos tenian ya al fin del siglo XVI numerosos súbditos y auxiliares de sus guerras. La mayor parte de los Tamacocies (llamados más tarde Chamacoco) y de los Chanés eran de estos y, si otros documentos de los años 1583 y 1584 refieren, que los Tamacocies, los Xores, los Mares y los Yuracares fuesen sus aliados, se trata probablemente de tales indios violentamente sometidos y empleados como auxiliares de guerra. (14) Mientras que los Tamacocies (Chamacocos) se emanciparon posteriormente de los Chiriguanos conquistadores y emigraron hasta el Oriente, la mayor parte de los Chanés, que eran antes una nación muy populosa, permaneció sometida por mucho tiempo. (15) Por causa del mal tratamiento que los Chiriguanos, de ordinario empleaban con ellos, existió siempre un contraste entre las dos naciones y los Chanés preferian ser dependientes de los Españoles que permanecer en la esclavitud de los odiados Chiriguanos. (16) Según la relación del corregidor Tomina, del año 1618, ya mencionada en el precedente escrito, la relación entre la población de Chiriguanos y la población de los Chanés era tal, que el numero de los Chiriguanos puros quedó por debajo al numero de sus súbditos. Según la tasación hecha en esta relacion, la población de los Chiriguanos de la Cordillera consistia en 1.500 Chiriguanos puros entre los cuales habian repartidos 10.000 Chanés. Entre los 400 Chiriguanos de la provincia de Machareti fueron repartidos 5.000 Chanés esclavos. Todavia varios siglos, los Chanés debieron permanecer en la rigurosa esclavitud de los Chiriguanos, hasta que en la segunda mitád del siglo XIX se quebrantó la formidable resistencia de los Chiriguanos y ellos perdieron definitivamente después de un rudo golpe su independencia quedando sometidos a los blancos. (17)

Desde este tiempo también los Chanés sacudieron la opresión de sus viejos dominadores formando a parte sus pueblos propios en medio de sus antiguos dueños (18). También la ultima insurrección de los Chiriguanos en el año 1890, fué vencida por los Bolivianos, por eso la situación de los Chanés no se modificó, así es que el explorador Erland v. Nordenskiöld se encontró con ellos todavia en las mismas condiciones. (19)

Habiendo descrito en lo que precede la historia de las relaciones de los Chiriguanos con los Peruanos antiguos y las demás tribus de indios, tenemos que tratar todavia sus relaciones con los blancos quiere decir con los Españoles o Bolivianos que poco a poco ocuparon su territorio. Tenemos que acentuar en primer lugar el hecho que los primeros blancos que vinieron a su territorio y a los Llanos confluantes, no eran para ellos una novedad, pues, ya antes de su emigración, los Chiriguanos se habian encontrado con ellos en su suelo natal entre el Rio Alto Paraná y el Rio Paraguay. Por la primera actitud de los Guaranies al encontrarse con los conquistadores ha sido decisivo el hecho de que las dos partes tenian el mismo destino que era el de enriquecerse de las riquezas de las tierras ricas del Oeste, de las cuales habian recibido noticias. Para alcanzar este destino común los Guaranies favorecieron al principio a los conquistadores, dándoles importantes noticias sobre la tierra rica y los caminos hasta allá. y poniendose a su disposición como auxiliares de guerra. Según Guzman, el Portugues Alejo Garcia, llevó consigo a 2.000 de esos Guaranies del Paraguay en su expedición al Perú y, si Guzman dice, que esa expedición de Garcia fué el motivo de la siguiente expedición de los Guaranies al Oeste y de la emigración de grandes partes de ellos en las regiones al Oeste del Chaco Paraguayo, no debemos rechazar esta opinión restringiendola solamente en aquel sentido que la expedición de Garcia fué uno de los motivos de esa emigración. Cuando posteriormente Nuflo de Chaves se encontró en su expedición con los Guaranies del cacique Vanbaguazu, estos le recibieron en amistad, le orientaron sobre la tierra rica y los caminos para allá y le dieron compañeros para su viaje. (20)

El primero de los conquistadores con quien se encontraron los Guaranies, después de su emigración a la Cordillera, llamados en adelante los Chiriguanos de la Cordillera, era el Capitán Domingo de Irala. Según la relación del P. Alcaya, Irala, cuando había llegado en estas regiones, envió un Guaraní de su comitiva a que atrayese a los indios Chiriguanos y en lo que sigue la relación dice literalmente: «y vinieron muchos de ellos a darle la paz.» Pero a pesar de esta paz, los Chiriguanos no quisieron descubrirle las minas de oro y prohibieron al Capitán Condori, a quien habian capturado en su expedición contra los Peruanos, y a quien cedieron ahora al Capitán Irala, como práctico, que descubriese algo respecto a las minas. (21)

El año de 1560 los dos conquistadores Nuflo de Chaves y Andrés Manso, llegaron en la región de los Chiriguanos, en la Provincia de Vitupue. (22) En la carta de Gabriel Paniagua de Loayza a la Real Audiencia, del año 1584, conocemos que los Chiriguanos de la Sierra, cuando Nuflo de Chaves llegó la primera vez a su tierra, venían de hacer guerra a los indios de Poxo o de Misque. Como ya fué mencionado en lo que precede, Nuflo de Chaves estorbó la venida y los hizo dejarse de las hostilidades. (23) Por la partición de los dominios que posteriormente sucedió entre Nuflo de Chaves y Andrés Manso, aquel recibió los

territorios del Norte y este los del Sud. Mientras que Nuño de Chaves tenía que ocuparse, principalmente con los Itatines Guaraní, llamados posteriormente Itatines-Guarayú, los cuales habían emigrado en esas regiones situadas más en el Norte y los cuales después de poco tiempo mataron al valiente conquistador, era desde el principio la misión de Andrés Manso de que arreglase las relaciones con los Chiriguanos de la Sierra y estorbase sus violencias. En el primer tiempo Manso consiguió entrar en conexiones pacíficas con la mayor parte de los Chiriguanos y ponerlos a servicios de vasallos; pero parece que ellos fuesen implicados ya desde el primer tiempo en las diferencias existientes entre Nuño de Chaves y Andrés Manso. Un documento del año 1501, el «Testimonio del Escribano Francisco Gallego», (24) da noticias interesantes sobre ese asunto. El dice que, el año de 1560, un indio Chiriguano llegó como delegado del cacique Bitupue y de otros caciques a Nuño de Chaves para lamentarse del proceder de Andrés Manso y en el mismo tiempo preguntarle que debían hacer. Mientras Nuño de Chaves, como fué mencionado, había prohibido a los Chiriguanos que prosiguiesen en violentando a los demás indios, poco tiempo después Manso los hizo juntar para ir a la guerra contra los indios de los Llanos. Los Chiriguanos habiendo conocido la intención del Capitán Manso, volvieron todos del camino. Manso tornó a hacer llamamiento para ir a la guerra contra los indios de los Llanos y llevó consigo a diversos caciques de los Chiriguanos. Pareciéndole que le llevaban por mal camino mató a un indio Chiriguano y mandó cortar la mano de otro. También había matado a un mensajero del cacique Botipue. Conocemos de esta comunicación que la hostilidad que surgió poco tiempo después en las relaciones pacíficas entre los Chiriguanos y Andrés Manso y que ha costado mucho trabajo, gastos y sacrificios a los Españoles y más tarde a los Bolivianos, era motivada, al menos por su mayor parte, por las violencias de los primeros blancos que tuvieron relaciones con esos indios. Esa culpa de los Españoles de las hostilidades continuas con los Chiriguanos fué aprobada francamente por el Maestro General de la Provincia, Don Salvador Pacit en el año de 1778. (25) El despachó orden a todos los militares que suspendieran sus empresas contra los Chiriguanos, manifestando que la actitud de los Chiriguanos era provocada por la introducción de los Españoles en sus tierras en donde establecieron estancias y ganados. El principio de las hostilidades entre los Españoles y los Chiriguanos se debió a que éstos de repente asaltaron al Pueblo de Condorillo o Santo Domingo de la Nueva Rioja, fundado por Andrés Manso y mataron a este junto con todos los demás Españoles y quemaron el pueblo. (26) La misma suerte tuvo el pueblo de Barranca fundada por Nuño de Chaves y el Capitán Miguel Martín y su gente en el pueblo de la Lagunilla. Además fueron muertos 9 hombres de la gente de Nuño de Chaves y también el Capitán Pedro Castro a quien se le había encargado reconstruir el destruido pueblo de Santo Domingo de Nueva Rioja. (27) Los asaltos y robos de los Chiriguanos contra los colonos españoles eran al fin del siglo XVI tan frecuentes y continuos que eran un constante peligro y dificultaban la conexión entre las diversas poblaciones mayores (28) Las diversas parcialidades de los Chiriguanos se habían repartido entre sí la tierra en donde debían hacer sus asaltos. (29) La expedición del Virrey Don Francisco de Toledo con mucha gente y grandísimos aparatos de guerra y con gran costo, no tuvo ningún éxito. (30) Los Chiriguanos siguieron robando y asaltando. De cuando en cuando fueron mandadas algunas expediciones para castigarlos, las que de paso quemaron algunas rancherías y cosechas de maíz

y mataron algunos de ellos, (31) pero nunca tuvieron un éxito desicivo, y esta situación duró todavia por dos siglos en una forma casi invariada. (32) Pero, a pesar de estas hostilidades, han existido ya desde los primeros tiempos, algunas relaciones entre los Chiriguanos y los Españoles. Según la Relación de la Annua de la Compañia de Jesús, del año 1596 se han procurado desde Potosí y las Charcas, muchos medios y vias para atraerlos hacia la paz, viendo la poca esperanza que se tenia de pacificarlos por las armas (33) y según la misma Relación entraron y salieron allá ya en aquel tiempo algunos Españoles para contratar con ellos y también los Chiriguanos llegaron a Potosí y a las Charcas a lo mismo. También Techo, que escribió su «Historia de la Provincia del Paraguay» en la segunda mitád del siglo XVII, refiere que los Chiriguanos vendieron sus prisioneros de guerra a los Españoles. «No perdian ocasión de dedicarse a este comercio; con los mismos Españoles combatian». (34) Según una comunicación del Escribano Mosquera, del año 1573 (35) vivian ya en aquel tiempo algunos Españoles entre los Chiriguanos. Este garante recibió noticia de la estada de dos Españoles y un mestizo entre ellos, tratandose probablemente de prisioneros de guerra.

Al fin del siglo XVIII las relaciones entre los Chiriguanos y los Españoles se modificaban en cuanto que desde ese tiempo la misión consiguió una propagación mayór de la fé entre los Chiriguanos. El año 1779 el Intendente de Cochabamba Don Tomás Leso habia derrotado después de reñida lucha a la parcialidad de Saypuru, que era la más temida. Más tarde fué constituida la reducción de la Florida, en la banda occidental del Guapay con unas centenas de familias que no habian ayudado a la parcialidad de Saypurú y como temiendo su venganza, siguieron a los Españoles. (36) Algunos años después fueron fundadas algunas otras misiones por los Franciscanos, junto con el fortin Saypurú, para resguardo para las misiones. Pero ya en el año de 1799 los Chiriguanos asaltaron seis de estas misiones desvastandolas completamente (37) Una gran campaña contra los Chiriguanos guiada por el Intendente Viedma en persona no habia tenido éxito alguno, dando la vuelta el ejército de dos mil hombres cuando dos oficiales fueron muertos por los enemigos. A pesár de eso rehicieron los misioneros las reducciones destruidas. (38) Según las notas del Fr. Antonio Comajuncosa (39) existen ya en el año de 1810, 18 misiones entre los Chiriguanos en la zona septentrional del Rio Pilcomayo. Por la influencia de las misiones y por medios violentos o pacificos de los Españoles y, más tarde, de los Bolivianos, confinantes con los Chiriguanos, pasaron poco a poco la mayor parte de los Chiriguanos al lado de aquellos, asi que el poder de la tribu de los Chiriguanos en otro tiempo tan fuerte e invencible, fué debilitada. (40) Asi sucedió que los habitantes de las provincias vecinas pudieron dar en el año de 1875 el ultimo golpe a las ultimas fracciones de Chiriguanos independientes, sujetando completamente y obligando a las parcialidades derrotas que no quisieron someterse se dispersaron por otras tierras, refugiándose algunas en el Chaco entre los Tobas y Tapietés. (40) Sin embargo, este no era el ultimo golpe entre Chiriguanos y blancos, como Cardúz supuso en el año de 1885. Una parte de los Chiriguanos ensayó en el año de 1890 una ultima rebelión contra los Bolivianos. Más o menos 5.000 indios, unidos en la planicie de Boynove cerca de Curuyuqui, combatieron un dia entero contra los Bolivianos, que eran auxiliados por unos mil de indios de la misma tribu. Al oscurecer el ardiente combate todavia no estaba decidido pero a la

noche los indios perdieron el animo ante la superioridad de las armas modernas y salieron de sus trincheras. (41) También después de esta derrota uno de los caciques, llamado Cayahari, preferió rehuir para no renderse a los Bolivianos. Dicen que se habia establecido en las cercanias de una grande laguna lejos de los blancos. (42)

El cuadro historico precedente ha demostrado que podemos averiguar la historia de los Chiriguanos por medio de numerosos documentos en un periodo de 400 años, hasta aquella época tan importante para su suerte futura y su cultura, en que emigraron de su pais natal estableciendose en una región lejana. En este nuevo pais encontraron condiciones de la vida completamente diferentes. Todo los tres factores, por los cuales toda la vida humana y toda la cultura humana son influenciadas y condicionadas, la naturaleza, el estado social y la cultura espiritual del ambiente eran otros en el nuevo medio y por eso tuvo que modificarse durante los cuatro siglos de su historia, su cultura primordial, que habian llevado de su pais natal.

Las producciones de su cultura actual, tratadas en esta publicación por medio de la colección etnografica que traje de Machareti y de Toledo, tenemos que considerarlas como el producto de numerosos y diferentes factores cooperantes. Algunas pocas de las producciones de la cultura antigua se han conservado en forma bastante primoldial hasta hoy; otras se han modificado, sea perfeccionándose, sea degenerandose. Muchas se perdieron completamente por causa de las circunstancias modificadas y algunas pocas se agregaron como resultado de la asimilación de culturas extrañas.

Como ya dijemos, la cuestión de la influencia de la cultura de los Chiriguanos, ha sido tratada extensamente por Erland Nordenskiöld. (43) Mientras que los Chiriguanos han recibido ralativamente poco de parte de los indios del Chaco tenemos que derivar las modificaciones más importantes de su cultura de las influencias de la cultura antigua de los Peruanos. Por causa de la poca duración del imperio de los Incas, después del tiempo de la inmigración de los Chiriguanos, tenemos que suponer que esas influencias fueseu menos influencias directas, que indirectas por medio de los pueblos confinantes a la tierra montuosa del Perú y de Bolivia, los cuales han estado por mucho tiempo en conexión con los Peruanos antiguos y de los cuales muchos los Chiriguanos los habian sujetado y los hicieron entrar en su comunidad como esclavos o vasallos. Sabemos que la cultura de los Chanés, los que integraron la mayor parte de la población Chiriguana, tenia conexión con la cultura antigua de los Peruanos. Por el contrario a la influencia de la cultura antigua de los Peruanos, la influencia de los blancos ha tenido más efectos disolventes y destructivos que constructivos para la cultura primordial de los Chiriguanos y Chanés quedando superflua muchas industrias indigenas porque era más comodo reemplazar sus productos por mercaderias importadas.

En los capitulos respectivos que tratan de los diversos desarrollos de la cultura de los Chiriguanos y Chanés expondremos los detalles de estas influencias de cultura.

Del cuadro histórico precedente resulta que la entidad étnica «Chiriguano-Chané» integra respecto a sus caracteres físicos una mezcla étnica de elementos absolutamente heterogéneos. Hemos relatado que los Chiriguanos, por siglos, capturaron muchos prisioneros, incorporándolos a su comunidad, y que al fin del siglo XVI el número de los Chanés incorporados era mucho más grande que el de los Guaraní-Chiriguanos puros. Aunque los Chanés, perteneciendo al grupo lingüístico de los Aruacos, eran una nación pacífica y no eran de fuerza igual con los Chiriguanos puros, su cultura, que, por mucho tiempo, estuvo en relaciones con la de los Peruanos antiguos, era sin duda superior a aquella de sus opresores y seguramente las mujeres Cheneses influenciaban bastante sobre sus amos. Viviendo los dos elementos de la población por 3 1/2 siglos juntos, tenemos que suponer que se habían mestizado extensamente.

Por desgracia, los documentos antiguos no refieren sino muy poco sobre las cualidades físicas de los Chiriguanos. La única breve noticia sobre este asunto, que conozco, la encontramos en la «Descripción y población de las Indias» por el Obispo Lizarraga: (44) «Son bien dispuestos, fornidos, los pechos levantados espaldudos, y bien hechos, morenazos. Pélanse las cejas y pestañas, los ojos tienen pequeños y vivos». Según el P. Alejandro Corrado en el año 1883, quiere decir, poco tiempo despnés de que los Chiriguanos perdieron su independencia a causa de los blancos y los Chanés principiaron a emanciparse de sus opresores, formando sus pueblos propios, no existen todavia diferencias somaticas entre los Chiriguanos y Chanés. «La fisionomía de estos era completamente idéntica de aquellos». (45)

Además de mediciones antropológicas hechas por Ten Kate de 4 Chiriguanos, (46) Robert Lehmann-Nitsche, en el año de 1906, tuvo ocasión de hacer mediciones antropológicas en el ingenio azucarero de San Pedro de Jujui, de 40 hombres Chiriguanos y de 10 mujeres Chiriguanas que habian venido de Bolivia para trabajar en el Ingenio. Titulados: «Estudios antropológicos sobre los Chiri-

guanos, Chorotes, Matacos y Tobas (Chaco Occidental)» (47) Lehmann-Nitsche ha publicado los resultados de esas mediciones junto con mediciones de otros indios y añadido a esa publicación en las primeras 12 laminas tipos Chiriguanos fotografiados por Carlos Bruch. Además de las mediciones somaticas, han sido publicadas por Lehmann Nitsche determinaciones del color del cutis y del iris y del color y de la forma de los pelos. De 36 de los 40 hombres Chiriguanos se expresa donde tenian su domicilio y por esto conocemos que esta gente habia venido de diversas regiones del territorio de los Chiriguanos al Ingenio en San Pedro. Habian algunos que vinieron de las regiones del Norte y uno había venido de la ciudad de Santa Cruz de la Sierra. Otros habian venido del Sud del territorio de los Cgiriguanos como por ejemplo, del pueblo Carapari, situado ya bastante al Sud del Rio Pilcomayo. Son nombrados 13 pueblos de los Chiriguanos, de los cuales habia venido un hombre solo de cada uno de ellos. De Charagua, de Parapiti y Carapati habian venido 2 de cada uno, de Ingre 4, de Santa Rosa 5 y de Machareti 8. Por desgracia, no se expresa el suelo natal de las mujeres Chiriguanas y se dice solo que han venido de Bolivia.

El termino medio de la altura de los hombres Chiriguanos, medidos por Lehmann-Nitsche, es de 163,4 cm. y para la altura de las mujeres Chiriguanas medidas de 151,7 cm. Este termino medio de la altura de las mujeres medidas, es bastante menos. El termino medio para la altura de los 8 hombres venidos de Machareti era solamente 161.8 cm. y para la altura de los dos hombres venidos de Parapiti solamente 158,1 cm. Pero el término medio para la altura de 4 hombres de Ingre era 169,15 cm. El más grande entre los hombres Chiriguanos medidos que tenía una altura de 178,6 cm. había venido de Ingre y el más chico con una altura de 153,5 cm. de Machareti. La mujer más chica (entre 35 y 40 años de edad) tenia solamente 143,0 cm. y la más alta 158 cm. Estos números nos demuestran que la altura entre los diversos individuos de los Chiriguanos es muy variable. Entre los Chiriguanos medidos por Lehmann-Nitsche el número de aquellos que vinieron de la misma región, es demasiado pequeño, como para podór hacer deducciones exactos sobre las diferencias de altura de los Chiriguanos de las diversas regiones para poder poner en claro la influencia somatica de la mestización con otras tribus.

Las fotografías de tipos Chiriguanos publicados por Lehmann-Nitsche muestran grandes variaciones entre las diversas facciones y cuerpos, lo que corresponde al hecho de que los Chiriguanos actuales son el producto de una mestización de varios elementos étnicos.

Buenas fotografías de los Chiriguanos de la parte del Sud de su territorio encontramos en la publicación de von Rosen «Ethnographical research work during the Swedish Chaco-Cordillera-Expedition 1901-1902». (48) También Erland von Nordenskiöld ha publicado tipos Chiriguanos y Chanés. (49)

EL TERRITORIO DE LOS CHIRIGUANOS.

Sobre la situación y extensión del territorio de los Chiriguanos en el tiempo de su independencia, quiere decir desde el principio del siglo XVI hasta la segunda mitád del siglo XIX, tenemos los estudios minuciosos de Moreno en dos lugares de su obra ya antes muchas veces citada, cuyos títulos son: «Las tierras de los Chiriguanos». (50) Según Moreno (51) los Chiriguanos—Chirigua-

Nota 47. Anales del Museo de La Plata. Tomo I. Entrega 2 (Segunda Serie). Buenos Aires 1908.
Nota 48. Stockholm. 1924.
Nota 49. Erland Nordenskiöld: Forskningar och äventyr i Sydamerika. Stockholm 1918. Bild 14-16; 20 y 31. Nord. I. Abb 75, 76, 79, 87, 106, 110, 111, 112, 116, 152 y Taf. 12-2.

nos de la Cordillera en contraste con los Itatines-Guarayús y los Piritaguaris llamados en la literatura también muchas veces Chiriguanos- habitaban desde el tiempo de la conquista hasta que perdieron su independencia al mismo territorio o sea los contrafuertes orientales de los Andes, desde el Sud del Pilcomayo hasta las tierras que se extienden a ambos lados del Guapay. Los Chanés, que antes tenían un gran territorio, muy poblado, «si bien formaron varias migraciones parciales, permanecieron en gran número sometidos a los guaranies conquistadores dentro de la región que estos convirtieron en morada inexpugnable». (52) Todavía en el año 1883 el P. Alejandro Corrado escribe, que entre los Chiriguanos situados entre los últimos contrafuertes de los Andes hallabanse diseminados los Chanés. (53)

También después de haber perdido su independencia, los Chiriguanos habitaron más o menos el mismo territorio. Habiendo conocido en persona del territorio de los Chiriguanos, solamente Machareti, me refiero aquí a los datos de Erland Nordenskiöld, que los ha conocido en los años 1908, 1909 y 1913 y recorrió, en persona la mayor parte de este territorio, empleando en todo 4 hasta 5 meses en el estudio de los Chiriguanos y Chanés. (54)

Según Nordenskiöld (55) el territorio de los Chiriguanos se extiende de la región cercana de Santa Cruz de la Sierra al Norte, hasta cerca del Rio Bermejo al Sud. Ahora el Rio Grande puede ser casi tenido por el rio limite de su territorio en el Norte. Es la tierra situada entre el borde de los Andes y la grande planicie del Chaco en cuyos valles viven los Chiriguanos y en parte los Chanés. Se puede decir que este territorio es habitado en todas partes en donde existe agua necesaria aunque no sea sino lo suficiente para beber ellos y los animales domesticos que poseen. Los Chiriguanos habitan ese territorio en continuidad, mientras que los Chanés viven hoy en territorios separados los unos de los otros. Así algunos en el Rios Itiyuro en Argentina, algunos en Caipipendi, algunos en el bajo Rio Parapití y otros cerca de Itaú, al Sud del Rio Pilcomayo. Fuera del territorio de los Chiriguanos así circunscrito, viven hoy algunos pocos Chiriguanos en el valle Sánta Rosa, al Norte de Santa Cruz de la Sierra y algunos pocos habian huido después de la última revuelta fracasada del año 1890 al Chaco sin que conozemos indicaciones sobre su paradero. Dentro del territorio de los Chiriguanos viven algunos Chorotes, cerca de Yacuiba y también sin contar con las misiones, todo el territorio ha sido penetrado por blancos y mestizos.

Según estos datos, referidos por Nordenskiöld, el territorio de los Chiriguanos ha quedado también después de su sujeción definitiva por los blancos y hasta el tiempo actual el mismo que tenian en el tiempo de su indepodencia, excepto, según parece, que ellos desandaron más hacia los valles y no viven ahora, como lo refieren los documentos del siglo XVI, encima de las montañas poco accesibles los cuales como fortalezas naturales les ofrecieron un buen refugio durante sus expediciones.

PUEBLOS y CASAS.

La disposición de los pueblos y la forma de las casas de los Chiriguanos no son actualmente las primordiales y han pasado probablemente dos diferentes transformaciones, una después la otra, influenciadas primero por la arquitectura de la cultura de los Incas y más tarde por la arquitectura de los blancos. Se-

gún la Annua de la Compañía de Jesús, Tucuman y Perú, del año 1596, los pueblos de los Chiriguanos componíanse solamente de algunas pocas casas que eran tan grandes como para habitar hasta cien personas. En su «Descripción breve de toda la tierra del Perú, Tucuman, Rio de la Plata y Chile,» P. Lizarraga (56) describe los pueblos de los Chiriguanos en forma siguiente: «El mayor de los pueblos es de cinco casas; lo común es de tres; más son muy largas de más de 150 pasos, a dos aguas con estantes en el medio sobre que se arma la cumbrera, y de estante a estante vive una parentela.» A la misma manera describe Garcilaso de la Vega (57) las grandes casas de los Chiriguanos: hacen un galpón grandisimo, y adentro tantos apartadijos« cuantos son los vecinos, y tan pequeños que no caben más de las personas. Por descripciones minuciosas junto con dibujos, conozemos la construcción de pueblos de los Guaranies antiguos de los Tupinambas a la costa oriental del Brasil. (58) Cuatro o cinco casas largas y rectangulares, han sido edificadas a poca distancia una a otra, alrededor de una plaza cuadrangular o pentagonal, y todo el pueblo a sido fortificado por un cerco de defensa. Sabemos también que los pueblos antiguos de los Chiriguanos tenian tales construcciones de defensa, por una noticia del año 1618, en cuyo año Ruiz Diaz de Guzman, encontró una tal fortificación de un pueblo de los Chiriguanos próximo al Rio Pilcomayo que consistia en «dos cercos concéntricos de piedra y de madera.» (59) Según Serrano (60) los pueblos de los Guaranies de la antigua Provincia del Uruguay estaban formadas solamente de cuatro a ocho casas grandes y rectangulares. «En 1627 los Jesuitas encontraron cerca de Yapeyú una aldea guaraní con cuatro casas en las cuales vivian unos cien indios. Identicas vivendas encontraron en San Ignacio y regiones próximas. Estas casas eran cuadrangulares y sumamente largas pasando muchas veces de 50 metros.»

Todavia durante el tiempo de su independencia los Chiriguanos han largado la construcción primordial de sus pueblos que servia en primer lugar a la defensa, pues al fin del siglo XVIII Viedma describe sus casas como «unos pequeños ranchos hechos de caña» (61)

El pueblo de los Chiriguanos, Machareti, ha sido edificado en su forma actual por misioneros Franciscanos, con calles anchas, paralelas y rectagulares conforme al estilo comun en las colonias españoles antiguas, pues su construcción no es producto de la cultura indigena de los Chiriguanos. Pero en partes, las casas, y en primer lugar, los depósitos para maiz edificados encima de postes, corresponden a las casas de otros pueblos Chiriguanos, sobre los cuales tenemos noticias por Erland Nordenskiöld y Eric. v. Rosen. (62)

El pueblo Ibitibi, en la parte Sud del territorio de los Chiriguanos, al Sud del Rio Pilcomayo, investigado minuciosamente por Eric v. Rosen fué habitado según indicación de los indios por más o menoe 300 personas. El pueblo estaba situado en una planicie rodeada por montañas y selvas. Las casas formaban una grande circunferencia, estando la casa del cacique en el medio. En la plaza libre, entre la casa del cacique y las otras casas, habian sido plantados algunos arboles para sombra. En otros pueblos de los Chiriguanos visitados por v. Rosen, las casas estaban dispersas sin ningun orden. También según las observaciones de v. Nordenskiöld, los pueblos de los Chiriguanos son en parte bastante grandes y habitados por alrededor de cien personas. Muchas veces los varios pueblos estan cerca uno de otro. Las casas están, por regla general, alrededor de una plaza plantada algunas veces con árboles y sirviendo por sitio donde se juega y se hace conferencias.

Las formas de las casas de los Chirignanos los conocemos exactamente por v. Rosen, (63) y en primer lugar por las buenas fotografias de tales casas. Las casas son rectangulares y sus tejados rematan en puntas. Paredes y tejados son sostenidos por postes. Las paredes consisten sea solamente en pértigas verticales de ramos o cañas, reunidas estrechamente y juntadas por ligadura horizontal, sea en pértigas entrelazadas cuyos intervalos son tapiados por barro. El tejado (opitiá) esta cubierto con paja. Una forma de casa ha sido publicada en fotografia por v. Rosen (64) uno de cuyos lados del tejado sobresale, en la perhilera, el otro lado del tejado. La misma forma de casa existia también en la cultura antigua de los Peruanos como muestran dibujos hallados encima de la superficie de vacijas peruanas antiguas.

Una especialidad de las casas de los Chiriguanos y en eso se diferencian ellas de los ranchos comunes de los moradores blancos, es que los dos lados oblicuos del tejado bajan hasta cerca del suelo pasando mucho la pared. También las casas en Machareti muestran esta especialidad. (Compare Fig. 14). La consecuencia de esta contrucción del tejado es que la puerta (ökye) de entrada está en el lado hastial. A poder cerrar la puerta sirven esteras de caña o pieles de ganado vacuno. (65) Influidos extensivamente por los blancos, los Chiriguanos y Chanés varian continuamente el estilo de sus casas, y según Nordenskiöld (66) hoy ya muchos de ellos edifican casas idénticas a las de los blancos.

Además, de las casas para habitaciones, los Chiriguanos y una parte de los Chanés, tienen casas edificadas encima de postes para casas de depósito (avatió) También en Machareti tales casas estaban por lo común, al lado de las habitaciones. La figura 16 muestra una tal casa de depósito. Una escalera que consiste en un poste, provisto de entalladuras, conduce a la plataforma (En la figura a la derecha). Estas casas de depósito sirven en primer lugar para guardar la cosecha de maiz y otros frutos. El espacio debajo de la plataforma sirve para guardar diversas otras cosas. Nordenskiöld ha visto tales casas, edificadas encima de postes, cuya parte superior servia en general para depósito, mientras que la parte inferior es aprovechada como habitación (67) Muchas veces están esas casas de depósito cerca de las plantaciones, lejos de las habitaciones (68)

Como muestra la figura 16 el cuadro para estos depósitos consiste en 10 postes verticales de diferente largor y bifurcados en sus extremos superiores para sostener los postes horizontales que forman el base para el tejado y la plata-

forma. El par mediano de los postes vérticales es el más largo y sirve para sostener la parhilera. De los demás 8 postes verticales, siempre dos, uno más largo y otro más corto, han sido colocados inmediatamente juntos en todos los dos lados del par mediano de postes y a una cierta distancia de él. De los postes horizontales, de los cuales cada vez uno es sostenido por cada uno de los 5 pares de postes verticales, sirven los que están colocados sobre el par más alto y sobre los dos pares de tamaño mediano de los postes verticales, para apoyar el tejado, mientras que los dos postes horizontales que están colocados sobre los dos pares más chicos de los postes verticales forman el base para la plataforma de la casa. Además de los 5 pares de postes vérticales que forman el cuadro de la casa, se agrega todavía un poste vértical de la altura de la plataforma que sirve para sostener la escalera que conduce a aquella. El techo de esas casas de depósito está cubierto como los techos de las casas de habitación, con paja. Las paredes se componen de pértigas de caña proximas las unas a las otras. Mientras que las pértigas de paréd de la casa de depósito publicada en figura 16 son horizontales, las de otras casas de depósito, las que conocemos por fotografias de Nordenskiöld, de v. Rosen y de Métraux, son veticales.(69)
La entrada que hay que alcanzar por medio de la escalera está como la de las casas de habitación, en el lado del hastial. La escalera consiste en un poste provisto con entalladuras como gradas. (70)

Debe existir alguna causa especial para explicar el hecho sorprendente de que los Chiriguanos tengan casas edificadas encima de postes, pues no puede ser que han llevado la costumbre de construirlas, de su suelo natál antiguo, porque los Guaranies nunca las han tenido. También no puede ser que la han adoptado de los blancos, porque estos nunca han empleado en aquellas regiones casas edificadas encima de postes. Tampoco tenemos indicios de que los Peruanos antiguos tenian tales casas. Es muy inverisimil que los Chiriguanos instalados en su nuevo territorio hubiesen inventado la construccion de esas casas, porque la naturaleza de su territorio no hizo necesaria la forma de tales construcciones. Hallamos en la América del Sud, casas edificadas encima de postes casi solamente en regiones expuestas a inundaciones. Así las encontramos principalmente en las regiones de las costas de la parte septentrional del continente Sudamericano, y ellas aparecen al Sud del Rio Amazonas, solamente por dentro de una zona relativamente estrecha en el centro del continente comprendiendo el territorio de los Chiriguanos. Según la indicación de Marban, del año 1676, (71) los Mojos tenían casas edificadas encima de postes y sin duda eran tales construcciones de casas bastante útiles en aquellas regiones pantanosas y muchas veces inundadas. Además Nordenskiöld encontró en sus viajes (72) una de esas casas, que sirvió de depósito, entre los Chacobos que viven, no muy lejos, al Norte de los Mojos. Algunas casas de los Qui-hua, situados entre el Rio Chapáre y el Rio Cochabamba habian sido edificadas encima de postes, pero Nordenskiöld mismo no tiene por primordial esa arquitectura entre ellos. De las tribus del Chaco que tienen casas de depósito edificadas encima de postes Nordenskiöld menciona a los Matakos. Yo hallé tales casas de depósito en el pueblo de los Matakos cerca de Linares pero también numerosas en las instalaciones de los Chorupís en Esteros. Nordenskiöld en sus publicaciones sobre los Chorupís, llamados por él Ashluslay, no menciona la existencia de tales casas de depósito entre estos indios, así es que tenemos que suponer que los Chorupís no han aceptado esta construcción de casas sino recientemente y probablemente de los Matakos con los cuales tienen muchas rela-

8: Schmidt SF10 Chiriguano

ciones. Para completar los datos sobre la extensión de las casas edificadas encima de postes, menciono también mis observaciones hechas en mis expediciones de los años 1901 y 1910 a los Guatós (73) Dentro de muchas casas estos indios construyen, debajo del tejado, y por medio de pértigas horizontales, una plataforma que sirve para guardar diversas cosas. En esta disposición especial de los Guatós al construir sus casas, hallamos el rudimento de las verdaderas casas edificadas encima de postes, y es motivada por las grandes inundaciones a las cuales están expuestas aun cuando hayan sido edificadas en lugares más altos de las tierras pantanosas.

No debemos tener a las casas edificadas encima de postes como producto de la cultura primordial de las tribus del Chaco. Queda como unico centro de su propagación, la zona mencionada en el interior del Continente Sudamericano, el centro de la cultura antigua de los Aruacos en estas regiones, el territorio de los Mojos. A esta cultura de los Aruacos pertenecieron también los Chanés, más tarde subyugados por los Chiriguanos e incorporados a su comunidad. Tenemos, pues, que suponer que las casas edificadas encima de postes, como las que encontramos todavia hoy entre los Chiriguanos y entre una parte de los Chanés, eran al principio originarias de la cultura de los Chanés y pasaron más tarde a los Chiriguanos, cuando las culturas de esas dos tribus se fundieron en una sola.

Sin duda la construción especial de esas casas de depósito tiene entre los Chiriguanos y Chanés hoy otro destino, como tenia en su principio. Según Nordenskiöld los Chanés del bajo Rio Parapiti, quiere decir de una región típicamente pantanosa, no tienen tales casas, mientras que ellas son comunes entre los Chiriguanos y también entre aquellos que viven en tierra firme no expuesta a inundaciones. Su destino es hoy entre los Chiriguanos y Chanés como también entre los Matakos y Churupis, en primer lugar, para guardar ciertas provisiones contra los numerosos perros y otros animales domesticos, los que pasean en gran numero por toda parte del pueblo. (74)

COMIDA Y BEBIDA. MANERA DE COMER Y DE BEBER

La caza y los pescados no tienen mucha importancia en la economia de los Chiriguanos y Chanés. Su territorio tiene relativamente pocos animales comestibles, y ellos tampoco son cazadores muy valientes. (75) De animales que se pueden cazar, ellos comen el puma y el tigre, mientras que desprecian los buitres, zorros y la carne de los monos, tan apetecida por otros indios. (76) Una contribución para su subsistencia que merece mencionarse es la del pescado, solamente para los Chiriguanos y Chanés que viven cerca del alto Rio Pilcomayo teniendo ese rio excelentes pescados. De los pescados del Rio Grande, esos indios no pueden aprovecharse mucho porque este rio hoy ya puede ser tenido casi como la frontera de su territorio. El Rio Parapiti tiene muchos pescados pero estos son muy pequeños. Mientras que los Chanés viven hoy en territorios en los cuales disponen por algunos meses de algunos pescados; muchos pueblos de los Chiriguanos están tan lejos de las aguas más grandes, que hace que no entre el pescado en la alimentación de sus habitantes. (77) Respecto a comida de carne, los Chiriguanos dependen de sus ganados, los que sin embargo, según Nordenskiöld, prescindiendo de la cria de chanchos y gallinas, ni aún alcanzan el numero del ganado de los Chorotes y Churupis. Ellos no comen la carne de asnos, caballos

Nota 76. Nord. 1. p. 190.
Nota 77. Nord. 2. p. XV y XVI.

y perros. (78) Aunque no tenemos datos exactos sobre el rendimiento de carne de su ganado, podemos suponer que aquél no es muy grande, así es que esos indios dependen principalmente de alimentos vegetales, quiere decir de los productos de su agricultura. Debemos decir que, en comparación con el maíz, toda la otra comida casi no tiene importancia excepto entre los indios del Parapití, entre los cuales la batata dulce es el alimento más importante. (79) En tiempos de carestía comen diversas plantas silvestres, principalmente las vainas dulces de la algarroba (Noviembre-Diciembre)-las que hacen fermentar grosseramente triturándose con agua para producir una especie de chicha que embriaga. (80)

Consistiendo las comidas, principalmente de maíz, ellas, son muy modestas, aunque el maíz lo comen en las más diferentes formas, asa hervido, asa tostado o como harina cocida al vapor, como pan de maíz frito, en revuelto o como polenta blanda de maíz. (81) Carne se come asada o hervida, junto con maíz. La sal de cocina emplean en las comidas. Mientras que antes la sal (dyáki) era buscada en las minas o sacada de las tierras de barreros, hoy ella es adquirida de los blancos. (82)

Entre las bebidas, merece mencionarse, fuera del agua, en ciertas regiones bastante escasa, la chicha, (ka'ni) fabricada de maíz, batata o de algarroba. (83) La chicha fabricada de maíz amarillo o blanco es preferida. La chicha fabricada por los Chanés del Río Parapití hecha de batatas, pasa como de menos valor.

Los Chiriguanos y Chanés, ordinariamente, no comen de una vasija común, pero sí separados y en platos. Por eso existen numerosos platos en sus casas, los que son fabricados por la comida de barro cocido (uyá'e) pero pueden ser también platos de madera (ma). (84) Varios platos de barro cocido ya las colecciené entre los Chiriguanos y Chanés, (compare fig. 78-80) así como también dos platos de madera, de los cuales el Museo ya tenía dos ejemplares donados por Fr. Maria F. de Casati. De los platos de barro cocido me ocuparé en el capítulo al tratar sobre alfarería, junto con las demás vasijas de barro cocido, enumerando por eso aquí solamente los platos de madera de la colección.

PLATOS DE MADERA (ma) DE LOS CHIRIGUANOS

I. A. 351. (Donación de Fr. Maria F. de Casati.) Diámetro 21 cm. Altura 6 cm.
I. A. 352. (") " 15.5 cm. " 3.5 cm.
I. A. 496. (Viaje Max Schmidt) Diámetro 23 cm. Altura 6 cm. (Fig. 18).
I. A. 497. (" ") " 20 cm. " 6.5 cm. (Fig. 18 a).

Como muestran las figuras 18, a y b, estos platos de madera tienen en su borde, dos asilleros.

Como utensilio para comer usan hoy los Chiriguanos y los Chanés, cucharas de metal las que son adquiridas de los blancos. Pero ellos usan también cucharas de madera. (85)

CUCHARAS DE MADERA (karaba) DE LOS CHIRIGUANOS

I. A. 393. (Donación de Dr. Maria F. de Cassel) Largo: 16 cm.
I. A. 494. (Viaje Max Schmidt) Largo: 42,5 cm. (Fig. 20).
I. A. 495. (" ") Largo: 14 cm. (Fig. 22).

Como muestran las figuras 20 y 22, existen variaciones de la forma de estas cucharas de madera. La forma de la cuchara I. A. 495 corresponde bastante exactamente a la cuchara de los Chaná, representada por dibujo por Nordenskiöld, (26), mientras que la forma de la cuchara I. A. 494 se asemeja más a las cucharas halladas en los sepulcros antiguos de la montaña Peruana, formando su parte anterior y su mango una línea bastante derecha.

Aunque pueda ser que la forma de las cucharas de madera de los Chiriguanos y de los Chaná haya sido influenciada en mucha cosa por la forma de las cucharas de metal adquiridas de los blancos, sin embargo, tenemos que tomarla por otra prolongación de la cultura Sudamericana indígena que, en tiempo prehistórico se había extendido bastante, generalmente entre las culturas andinas. Entre las tribus salvajes de la América del Sud, se conocen en bastante. Habitado precisamente los casos en los cuales ella ha sido importada por los blancos. Pero especialmente entre los indios de las regiones vecinas al territorio de los Chiriguanos, ella es bastante común, así entre los Tupiniki y muchas otras tribus del Chaco, como Tobas, Matacos, Chorotis, así sobre todo, también entre los Mojos y aún al Este entre los Guaiás. Hay que suponer que los Chiriguanos hayan recibido este bien de cultura directa o indirectamente de la cultura de la montaña andina.

CUCHARAS (tabe) COMO UTENSILIOS PARA COMER.

I. A. 734 y 735. (Iruki) Largo: 22 cm. y 19 cm.

Fuera de las cucharas mencionadas, los Chaná-Iguaio emplean también muchas veces utensilios para comer.

Como vasijas para beber agua y chicha, usan sobre todo, cuyas (compare las figuras 24-26 y 149; 150; 151.) y calabazas. (compare las figuras 42 y 151). A las fiestas de chicha esta bebida se sirve ordinariamente de las vasijas de barro cocido, pintadas, en cuyos dibujos, los que se hace circular entre los asistentes. En los cuyos que he adquirido de los Chiriguanos en Machareti muchos tienen dibujos grabados o pirograbados, de los cuales trataré en el capítulo relativo al arte. Las cuyas cocidas de los Iguaio, no están dibujadas, lo que se explica fácilmente por la circunstancia particular de que los Iguaio vivían en aquel tiempo cerca de Tolaba. Tres de las calabazas cortadas de los Iguaio (compare figura 42 c) han sido fabricadas de la fruta del árbol Cuamachi. Crece, que no crece en su territorio. El origen de los Iguaio me refirió que estas frutas fueron traídas desde Santa Cruz de la Sierra.

Además de esas cuyas, Chiriguanos e Iguaio usan también para beber chicha, vasijas chicas de barro cocido hechas con asas en forma de tazas europeas.

La más alta de esas calabazas mide 50 cm. y la más chica, 7,5 cm.

EXITANTES.

Los Izozós que hallé en Toledo, no eran fumadores. Al tabaco y a las pipas que yo les ofrecí no dieron importancia. De los Chiriguanos yo adquirí una simple pipa de madera con la forma derecha, tal como la usan en común las tribus del Chaco, pero no he visto otras pipas entre ellos; tampoco los he visto fumando.

PIPA (cachimbo) DE LA COLECCIÓN.

I. A. 740. Chiriguano. Largór 10,5 cm. (Fig. 23.)

Según Nordenskiöld, los Chiriguanos y los Chanés plantan tabaco pero su plantación no tiene importancia y ellos no son grandes fumadores. Si ellos fuman, usan en común cigarrillos, con tapa hecha de hoja de maiz y solamente pocas veces en pipas. (87) De eso se explica la forma poco característica de la pipa que hallé entre los Chiguanos. Una pipa de un tipo muy diferente, provista de un asidero especial adelante del recipiente para el tabaco es representada por dibujo por Nordenskiöld. (88) Según el mismo autor, los Chiriguanos que viven cerca de los Quichuas, han recibido de estos la costumbre de masticar coca.

Nota 88. Nord. I. p. 179. Abb. 8c.

CUIDADOS DEL CUERPO Y DESCANSO

Los Izozós en Toledo y los Chiriguanos en Machareti presentan contrastes con los indios del Chaco a los cuales visité, por ser relativamente aseados. Tenemos que reconocer que ese aseo elogiado también por otros autores tiene lugar, apesar de que una gran parte de ellos viven en regiones con muy poca agua y donde muchas veces la cantidad no puede satisfacer las necesidades del aseo sinó con grandes dificultades. Según Nordenskiöld se bañan varias veces al día y muchas veces directamente después de la comida. Después de la comida ellos se lavan la boca y las manos. (89)

Para dormir, los Guaranies antiguos utilizaban en común la hamaca. «La hamaca para dormir y que suspendían de dos pilares de la vivienda, ha dado carácter a los Guaranies», dice Serrano de los Guaranies de la antigua Provincia del Uruguay. (90) Los Chiriguanos o Izozós tienen hoy todavía hamacas, pero estas no son utilizadas en común y sirven menos para dormir de noche que para descansar de día. (91)

HAMACAS (Chir: kia; Izozó: iul.) DE LA COLECCIÓN

I. A. 448. Chiriguano. De lana. Largór 230 cm. Anchura 75 cm. (Fig. 102 b).
I. A. 449. » » » 105 cm. » 60 cm.
I. A. 450. » » » 285 cm. » 60 cm. (Fig. 102 a).
*I. A. 360. Donación del señor Teodoro Rojas. (Chanés del Parapiti). De Caraguatá. Largór 320 cm. (Fig. 102 c).

Las Hamacas adquiridas por mi entre los Chiriguanos, en Machareti han sido fabricadas todas de lana y asimismo las hamacas que Métraux vió entre los Chiriguanos. (92) Según Nordenskiöld (93) las hamacas de los Chiriguanos se hacen comunmente de algodón y solo accidentalmente de lana. De las tres grandes hamacas de la colección, dos (I. A. 448 y 449) han sido trenzadas con la técnica muy común entre los indios de la América del Sud, la que he llamado en mi publicación sobre los Guarayús, hecha en esta misma Revista, el «trenzar con hilo doble» (Doppelfadengeflecht), (94) mientras que una (I. A. 450) muestra la estructura de un tejido. (Compare figura 102 a.) De los Chanés la colección del Museo tiene la hamaca I. A. 360 la que el señor Teodoro Rojas ha adquirido entre los indios del Rio Parapiti y donado al Museo. (Figura 102 c.) Esta hamaca ha sido fabricada de fibras de Caraguatá y con técnica de red. Según Nordenskiöld, los Chanés tienen fuera de tales hamacas de fibras de Caraguatá, también otras hechas de algodón, sobre cuya técnica no tenemos datos. Respecto a los detalles de esas hamacas de los Chiriguanos y Chanés remito a los capítulos destinados a la descripción de la técnica de trenzar y de la técnica de preparación de la red.

El Chiriguano duerme por lo general encima de una especie de catre, (catre) quiere decir una armadura de cama hecha de caña. Tales camas que fuera de su destino propio sirven también para secar el maiz han sido representadas por dibujos por Eric v. Rosen (95) Erland v. Nordenskiöld (96) y Métraux. (97). Sin

duda el clima frío de la región a la que los Chiriguanos habían inmigrado, hizo que abandonaran el uso de la hamaca para dormir, poco práctico para un tal clima y que la reemplazaron por el catre, ya común entre las otras tribus de aquellas regiones. Por falta de un catre, los Chiriguanos duermen en el suelo. Por cama emplean en ese caso grandes esteras de caña o de hoja de palmera o también cueros (98). De los Chiriguanos yo he adquirido una tal estera trenzada de hoja de palmera. (Figura 95)

ESTERA (tápa) DE LOS CHIRIGUANOS DE LA COLECCIÓN

I A. 540. Largor 1,75 m. Anchura 1,50 m. (Fig. 95)

En algunas casas de los Chiriguanos yo he visto también bancos de madera, apika, pero por desgracia no pude adquirir ningún ejemplar. Esos bancos con forma de un trineo, asemejanse mucho a la forma de bancos que son muy comunes entre los Indios del Brasil. (99) y de los que conocemos también de los Peruanos antiguos. (100) Nordenskiöld y Métraux representan tales bancos de los Chiriguanos por dibujos. (101)

PINTURAS Y DEFORMACIONES DEL CUERPO

Al aumentar la vestimenta de los Chiriguanos y Chanés, la costumbre de pintarse o tatuarse el cuerpo ha perdido naturalmente su importancia y los restos de estas costumbres son demasiado pocos para poder referir lo que era en los tiempos pasados. Tampoco tenemos datos sobre eso. Muchas veces yo he visto que las mujeres y muchachas de los Chiriguanos e Ismés, pintanse, con urucú, manchas coloradas en la cara. Según Nordenskiöld, algunas veces, mujeres y hombres se pintan la cara con tinte colorado y también el cuerpo. (102) También halló Nordenskiöld el tatuaje de los brazos de algunas mujeres y de un hombre de los Chiriguanos. (103) La costumbre de teñir con azul oscuro los dientes, Viedma la ha encontrado entre los hombres de los Chiriguanos (104) y Nordenskiöld entre las mujeres en el valle de Caipipendi. (105) Estas empleaban para eso las hojas de una planta que llaman «tajú» (tayú=lapacho).

Respecto a las deformaciones del cuerpo podemos suponer que antes era costumbre común entre Chanés y Chiriguanos de ponerse un «tembetá» en el labio inferior, perforado. De los Guaranies de los tiempos antiguos se ha afirmado que los hombres tenían ese tembetá, y por hallazgos prehistóricos esta costumbre es confirmada. (106) La forma, el material y las dimensiones de estos tembetás eran diferentes y conforme a las diferentes regiones. ¿Cuál es la forma del tembetá que tenían los Guaranies, que, al principio del siglo XVI emigraron a los contrafuertes de la Cordillera? No lo sabemos. Tampoco no conocemos si los Chanés tenían tembetás cuando fueron esclavizados por los Chiriguanos. Podemos suponer que los tembetás de metál de los Chiriguanos y Chanés con su forma actual, proceden de la época después de su conexión con los Peruanos antiguos.

pues no conocían la técnica de labrar metales y también hoy la mayor parte de sus tembetás son labrados por mestizos vecinos o blancos, que los hacen conforme a su gusto. Según la relación de Chomé (107) los hombres Chiriguanos llevaban en el labio inferior perforado, pequeños cilindros de estaño, plata o resina. Tal vez se puede suponer que los mencionados tembetás de plata de los Chiriguanos fueron antes más común entre ellos. Según Nordenskiöld, en el tiempo de su viaje, quiere decir en los años 1908 y 1909, todos los hombres Chiriguanos y Chanés de la generación más vieja y en algunos pocos pueblos de los Chiriguanos también los mozos y muchachos llevaban el tembetá. Entre los Izozós que encontré en Tolelo y «15 de Agosto» tenían solamente los hombres viejos el tembetá. (Compare las figuras 27 y 28) y entre los Chiriguanos en Machareti no he visto ningún hombre con ellos.

TEMBETAS DE LA COLECCION

I. A. 729. Izozó. Largor de la base 2,6 cm. Altura del cilindro 0,9 cm. Diámetro del cilindro 1,5 cm. (Fig 28 b.)

I. A. 730. » Largor de la base 2,8 cm. Altura del cilindro 1,3 cm. Diámetro del cilindro 1 cm. (Fig. 28 d.)

I. A. 731. » Largor de la base 2.5 cm. Altura del cilindro 1,3 cm. Diámetro del cilindro 0.8 cm. (Fig. 28 a.)

I. A. 732 » Largor de la base 3,2 cm. Altura del cilindro 1,4 cm. Diámetro del cilindro 1,8 cm. (Fig. 28 c.)

I. A. 733. » Altura 2 cm. Diámetro 1,8 cm: (Fig. 28 e.)

La forma de los cuatro primeros de los mencionados tembetás es la de un cilindro puesto encima de una base del mismo metál. En la superficie anterior del cilindro se halla puesto un disco de una piedra semipreciosa, azul o verde, que muestra en tres casos una perforación redonda en el centro, la que en dos casos es llenada con metál. El disco de piedra del tembetá I. A. 729 está roto. El tembetá I. A. 733, es de cera y tiene la forma de un cono obtuso. Los témbetás descritos por v. Rosen y v. Nordenskiöld, se diferencian de los mencionados en cuanto que en su superficie anterior del cilindro, en lugar de la piedra semipreciosa han sido puestas piedras chicas, azules o verdes, o también abalorios del mismo color, colocados por dentro de una capa de cera con la que el cilindro está llenado. Una buena representación por dibujo de un tal tembetá de los Chiriguanos con abalorios publica v. Rosen (108).

Según Nordenskiöld (109) los tembetás de los Chanes son generalmente más chicos que los de los Chiriguanos. Comparando las medidas de los tembetás adquiridos por mi entre los Izozós con las medidas referidas por v. Rosen, esta afirmación es justa respecto al largor del base de los tembetás y respecto al diámetro del cilindro. Ciertamente también estas diferencias entre el tembetá más grande de los Izozós y el tembetá descrito por v. Rosen son muy pequeñas, ascendiendo esta diferencia respecto al largor de la base, solamente a 3 mms. y respecto al diámetro del cilindro, solamente a 2 mms. En contraste con eso la parte cilíndrica de tres de estos tembetás de los Izozós es bastante más alta que la parte correspondiente del tembetá descrito por v. Rosen. Mientras que la altura de éste mide solamente 1 cm., los cilindros de los tres tembetás de los Izozós tienen una altura de 1,3-1,4 cm. La altura del cuarto tembetá de los Izozós es casi como la del mencionado tembetá de los Chiriguanos, siendo 1 mm. menor que este.

LAMINA XI

La manera como se usan esos tembetás ha sido descrita muchas veces. La figura 27 muestra un hombre Izozó, de cuyo labio inferior perforado sale el disco redondo de piedra. Utilizando el tembetá esos indios, le hacen pasar del lado interior por la perforación del labio así que su base se queda entre la hilera de los dientes inferiores y el labio inferior avanzando el cilindro del labio.

La base inferior de tres de los tembetás de los Izozós representa un plano recto y solamente la base inferior del tembetá I. A. 129 tiene una forma claramente cóncava. Llama la atención eso porque v. Nordenskiöld y v. Rosen, describiendo los tembetás de los Chiriguanos y Chanés, mencionan solamente los que tienen una base cóncava (110).

Según Nordenskiöld, los Chiriguanos y Chanés algunas veces usan tembetás de madera en forma de cilindros chatos. (111) Como ya mencioné, recibí de los Izozós un tembetá simple de cera. El hombre viejo que lo sacó de su labio inferior para entregármelo, lo traía sin duda provisoriamente por falta de un otro tembetá, para cerrar la perforación de su labio inferior y evitar la salida de la saliva.

Los Chiriguanos y Chanés en común, no tienen la costumbre de perforar sus lóbulos de sus orejas. Según Nordenskiöld (112) los caciques antes usaban zarcillos provistos de piedras verdes, pendientes. Si las mujeres más jóvenes y las mozas recientemente usan pendientes, ellas imitan esta costumbre de las blancas. El cacique de los Izozós en Toledo, me contó que las mujeres tenían zarcillos de oro y de plata, los que en aquel tiempo los habían escondido.

CORTE Y PEINADO DEL CABELLO Y ADORNOS DE LA CABEZA

Las mujeres tienen el cabello trenzado con trenzas largas, o medio largo pendiendo hasta los hombros (113) Como se puede ver en las figuras 4, 5 y 12 y en las fotografías de mujeres Chiriguanas publicadas por Lehnann-Nitsche, los cabellos de las mujeres y mozas son siempre partidos sobre la frente. Una tal raya ya tienen las mozas desde la primera juventud. (Compare figura 8.) En el tiempo de la primera menstruación los cabellos de las mozas se cortan cortos (114) y también las mujeres cortan sus cabellos en caso que fallezca su marido o uno de sus parientes allegados; algunas veces los cortan dos veces cuando muere su marido. (115) En la nuca y algunas veces también encima de la cabeza, los cabellos son unidos por vendas de algodón. La colección traída por mi a la Sociedad Científica del Paraguay contiene 29 de esas vendas usadas por las mujeres de los Izozós, las que representan todas la misma forma típica.

VENDAS PARA LOS CABELLOS DE MUJERES, DE LA COLECCION

(I. A. 624-652.) (Izozó) (I. A. 646 y 641 representadas en Fig. 32. a. y b.)

El largor de estas vendas para cabellos por término medio es 1,04 cm. La venda más larga mide 1.45 m. y la venda más corta 0,65 m. El largor de las borlas por término medio es 14,3 cm. La borla más larga mide 17,5 cm., la borla más corta 9 cm.

La forma de estas vendas, que todas han sido fabricadas de algodón, es en común igual. Como la figura 32 muestra ellas consisten en una parte mediana, larga, que tiene en sus dos extremos una especie de borla, la que se compone de varios cordeles provistos de nudos. La parte media consiste por lo común en un cordón trenzado de tres madejas de hilo a modo de una trenza. Pero ella puede tener tambien la forma de una venda, si han sido trenzadas más de tres madejas de hilo como muestra la figura 32 a. Las borlas de esas vendas son fabricadas de la manera siguiente: Los extremos de los hilos de la parte mediana son envueltos por otro hilo, de modo que con el mismo hilo están hechos los nudos, directamente uno tras otro o en una cierta distancia. El número de esos pendientes provistos de nudos, varia, respecto a las vendas de la colección, entre 3 y 8, pero pasa solamente en 4 casos, el número 5.

De los números mencionados respecto al largor de esas vendas para cabellos, resulta que su largór puede ser muy diferente. La venda más larga mide más que el duplo del largór de la venda más corta de la colección. Las vendas han sido fabricadas de hilos de colores muy diferentes. Asi hay entre ellas blancas, azules o de color lila o pardo, con diferentes matices hasta ser casi negros. Por lo común la parte mediana y el hilo que forma los nudos de las borlas tienen el mismo colór. Solamente de la venda I. A. 629 el colór de la parte mediana es diferente del colór de las borlas.

Según Lehnann-Nitsche también algunas de las mujeres Chiriguanas que fueron objeto de sus investigaciones antropológicas, llevaban tales vendas en sus cabellos, asi que podemos tener éstas por un bien de cultura común a los Izozós y a los Chiriguanos. Pero según ese autor, las que él vió entre las mujeres Chiriguanas y las que califica de «cordones adornados de una serie de nudos» eran fabricadas de hilos de lana. Las mujeres Chiriguanas las usaban a la manera de que sus cabellos fueron entrelazados con ellas. (116)

Hay que mencionar todavia un adorno de cabeza usado por las mujeres Chiriguanas en las fiestas y como distintivo especial. Ese adorno, descrito por Nordenskiöld, se compone de una venda frontal a cuya parte posterior ha sido atado un largo pendiente de adorno. (117)

Los hombres Chiriguanos y Chanés usan hoy los cabellos, las más de las veces, a la manera moderna, cortados cortos. Los dos muchachos Chiriguanos representados en figura 7 usan hasta una raya lateral con rodete, talvéz preparada especialmente para la fotografia. Los cabellos del muchacho Izozó representado en la figura 11, en la parte anterior de la cabeza, son bastante largos pero por atrás y a los lados también sus cabellos han sido cortados. Solamente los hombres más viejos y según Nordenskiöld en los pueblos de los Chiriguanos del alto Rio Pilcomayo tambien los jóvenes (118) usan el cabello largo y envuelto de una manera especial alrededor de la cabeza. Lehmann-Nitsche (119) nos refiere exactamente sobre este uso de cabello de los hombres viejos de la manera siguiente: «El cabello de éstos no habia sido al parecer nunca cortado y estaba peinado de una manera especial: echado hacia atrás lo partian con las manos en dos mitades a derecha e izquierda respectivamente, después se trae la mitad derecha hacia delante y se envuelve hacia la izquierda alrededor de la cabeza en forma de turbante musulmán, mientras que con la mitad izquierda se la envuelve a la inversa.» Los rodetes de los hombres Chiriguanos descitos por Lehnann-Nitsche eran atados con pañuelos comunes. Entre los Izozós yo hallé algunas vendas es-

Nota 119. Lehmann-Nitsche. l. c. p. 56.

trechas las que servian especialmente a ese destino, y Nordenskiöld representa por fotografia un hombre Chané con una tal venda. (120) Según una noticia de las Annuae litterae Societatis Jesu anni 1605 los hombres Chiriguanos, antes, usaban una tonsura así como los Guaranies del Paraguay y los Tupinambás en las costas del Brasil: «Coronis in modum nostrorum sacerdotum utuntur.» (121)

VENDAS PARA LOS CABELLOS DE HOMBRES

I. A. 653-660. (Izozó), tejidas de algodón. (Fig. 30: I. A. 660, 653, 655, 656.)

El largor de estas vendas para cabellos de hombres mide por término medio más o menos 1 m. La más larga tiene un largor de 1,18 m. y la más pequeña de 0,91 m. En tanto qun el largor de todas estas vendas es casi el mismo, existen diferencias bastante grandes en la anchura de ellas; difiriendo la anchura entre 1 cm. y 3,3 cm. Las más estrechas de esas vendas han sido tejidas simplemente sin ornamentos y son en parte blancas, en parte teñidas posteriormente con tinte azul, colorado o azul gris. Las dos vendas más anchas de una anchura de 3 resp. 3,3 cm., muestran ornamentos simples producidos por el tejér. Sobre los detalles de la técnica de esos tejidos y de sus ornamentos trataré en los capitulos relativos a los tejidos y a la arte.

Además de esas vendas tejidas de algodón los Izozós tienen vendas para los cabellos de hombre, más largas y anchas, tejidas de pelo humano, terminando en sus dos extremos en franjas.

VENDAS PARA LOS CABELLOS DE HOMBRES TEJIDAS DE PELO HUMANO.

Estas vendas tejidas de pelo humano corresponden, con respecto a su fabricación, a las vendas que los Chiriguanos y Chanés fabrican hoy en gran numero para venderlas a los blacos. Estas «fajas,» como son llamadas, hoy comunmente, representan un articulo muy solicitado por los blancos, que están en conexión con esos indios y especialmente por los soldados, para traerlos como cinto. Uno de los dos hombres Chiriguanos representados en la figura 6 trae una tal faja como cinto y, porque podemos suponer que eso es hoy su destino principal también entre los Chiriguanos las trataré en el capitulo siguiente destinado a la descripción del vestido.

SOMBRERO (kandáo) DE PAJA DE LOS CHIRIGUANOS

I. A. 554. Diámetro 30 cm. Altura 12 cm. (Fig. 99.)

La técnica de ese sombrero trenzado de fibras de hojas de palmera no es indígena pues es fabricación moderna. Como muestra la figura 9 también los hombres Izozós usan tales sombreros.

GORROS HECHOS CON PUNTO DE CROCHET

I. A. 442. y 443. (Chiriguano.) De lana. Altura 15,5 cm. resp. 14 cm.

Esos dos gorros hechos de lana con punto de crochet, los que recibí de los Chiriguanos en Machareti, tenemos que tenerlos también como de fabricación moderna.

Nota 120. Nord. I. Tafel 39.
Nota 121 Métraux I. p. 467.

PEINES (kivas) DE LA COLECCIÓN

I. A. 740. (Hallado en el camino entre Capirenda y Garrapatal.) Largór 9,5 cm. Anchura 9 cm. (Fig. 29. a.)

I. A. 1327. Izozó. Largór 7,5 cm. Anchura 3,5 cm. (Fig. 29. b.)

Los dos peines de la colección, procedentes de los Izozós representan dos tipos de peines completamente diferentes. Al primer tipo pertenece el peine I. A. 740, que se compone de varios palitos de madera, los que están unidos entre dos palos de caña, trasversales, entrelazados con hilos. (Compare figura 29. a.) El peine I. A. 1327, del segundo tipo, ha sido entallado simplemente de un pedazo chato de madera. (Compare figura 29. b.) Un peine semejante al peine I. A. 740 oriundo de los Chanés, Nordenskiöld le representa por dibujo. (122) Los tres peines de los Chiriguanos representados por dibujo por Nordenskiöld (122) pertenecen al segundo tipo y han sido entallados en madera como el peine I. A. 1327 de los Izozós. Pero en contraste con este las partes superiores de sus asideros han sido esculpidos. También los peines de los Chiriguanos representados por dibujos por v. Rosen y Métraux (123) son ornamentados por tales esculturas.

Estaba en duda hasta ahora el saber de qué manera estos dos tipos diferentes de peine estuvieron distribuidos entre los Chanés y los Chiriguanos. Según Nordenskiöld (124) los Chiriguanos tienen solamente peines entallados en un pedazo de madera y los Chanés en común, el tipo de peine provisto de palitos y pocas veces el simple peine entallado en madera. V. Rosen y Métraux hallaron entre los Chiriguanos peines de palitos (125) y, como ya mencioné, he recibido estos dos tipos de peine, de los Izozós. Conforme con eso, yo creo, que tenemos que decidir esa cuestión de la forma por la cual aparecen los dos tipos de peines simultaneamente entre los Chiriguanos y entre los Chanés pero advirtiendo antes que entre estos, el peine provisto de palitos es más frecuente y entre aquellos, el peine de madera es más común.

Porque la difusión de los simples peines entallados en madera, como los tienen los Chiriguanos y Chanés- Izozós, es relativamente restringida entre las otras tribus de indígenas de la America del Sud, pero este tipo de peine era conocido a la cultura Peruana antigua, tenemos que reducir también ese bién de cultura a influencias Peruanas antiguas. (126) Los peines provistos de palitos, los que nosotros conocemos de los Chanés y de los Chanés - Izozós se diferencian de tales peines, usados por la mayor parte de las tribus del Chaco, por ejemplo, de los Churupis y de los Mokó, no solo respecto a su material, sino que también respecto a la manera de su fabricación. Pero no acepto la opinión de Nordenskiöld según la cual esos peines de los Chanés se diferencian, por ser aprovechables solo de un lado, de los de las tribus del Chaco, que fueron aprovechables por los dos lados. (127) También los peines munidos de palitos, de los indios del Chaco, que yo conozco, son usados para peinarse, solamente de un lado, en tanto que el otro lado forma el asidero. Podemos conocer eso claramente porque los palitos de caña que forman las puas del peine son puntiagudos solamente en un extremo. La diferencia principal entre los peines de los Chanés y los peines de las tribus del Chaco consiste en que las puas de estos están formadas por palitos de caña y las puas, de aquellos por palitos de cualquier otra madera. Los

Nota 122. Nord. l. c. pág. 200.

Nota 126. Nord. l. c. 95.
Nota 127. Nord. l. p. 200. Métraux I. p. 467.

pasa de madera del peine de los Izoaio de nuestra colección, están entre dos palitos chatos de caña, verticales a ellas, y en la parte del anverso han sido insertados entre los palitos cuyas partes inferiores forman las pasa, palitos más cortos así que existe en la parte inferior del peine una cierta distancia entre las pasa. El enrejado, consistiendo en hilos de algodón, alcanza en la parte superior del peine casi el borde, pero pasa también un poco a la parte inferior que forma las pasa. El envijado no es asegurado por cera.

Respecto a los cuidados al cabello tenemos que mencionar todavía las indicaciones de Nordenskiöld y de Métraux (127) de que los Chiriguanos y una parte de los Chanés friccionan su cabello con la semilla de «Nyantéro» (=según Métraux Sitira=) y los Chanés del Paraquí con camara del mismo «yuqo».

De la descripción del P. Lizárraga (128) sabemos que los Chiriguanos y Chanés en tiempos pasados se sacaban los pelos del cuerpo, fuera del cabello, como hacían la mayor parte de los indios de America del Sud. Padre Lazarraga dice que los Chiriguanos se sacaban las cejas y la pestaña. Esta costumbre hoy ya no existe y las fotografías de hombres Chiriguanos, desnudos, representados por Lehmann Nitsche, (129) muestran, que hoy por lo común no se sacan los pelos de las partes pudendas. También encuentranse hoy diversos hombres de edad mediana que tienen bigotes, como el cacique de los Izoaio representado en la figura 10 y diversos de los hombres Chiriguanos representados por dibujos por Lehmann - Nitsche. (130) Por causa de esta variación, naturalmente el utensilio para sacar los pelos formado por pinzas chicas, antes muy común, ha perdido hoy una grande parte de su importancia y también en su forma transformada como adorno de pecho el es más raro. Yo hallé tales pinzas entre los Matacos y los Chorupis. Por desgracia no logré aquirir tales pinzas o el correspondiente adorno de pecho, llamado «bolvera» también por los Chiriguanos. Nordenskiöld describe exactamente esas pinzas (131) y el añade que los Chiriguanos emplean también palitos de caña para sacar sus pelos.

La forma de esas pinzas fabricadas de metál, corresponde a la de las pinzas conocidas por hallazgos hechos en sepulcros de los Peruanos antiguos. Hoy, esas pinzas son fabricadas por lo común de cualquier pedazo de lata o chapa de hierro, pero hasta hoy los Chiriguanos usan todavía algunas de esas pinzas hechas de plata, las que provistas de un cordón, ellos usan también, fuera de su destino primordial, como adorno de pecho. Esta costumbre, de usar la pinza como adorno de pecho, era muy común entre los Peruanos antiguos. Entre los collares de estos hay muchos que consisten, aparte de otras cosas, de pinzas de plata. Fué costumbre entre los Peruanos antiguos que esas pinzas agrodadas, impropias para su destino primordial, se transformaron en adorno pero o distintivo. El Museo de Etnografía en Berlín tiene tales adornos en forma de pinzas para depilar, fabricadas de cobre, de plata o de oro y en gran número, de los cuales un ejemplar tiene un largor de 58 cm. (132) Por eso cuando que tenemos que deducir que la costumbre de los Chiriguanos de usar como adorno de pecho es adorno de plata en forma de una de esas pinzas son debida a la influencia Peruana antigua. De las «bolveras» ahora raras y sin duda las más veces guardadas cuidosamente de la vista de los blancos, existen varios ejemplares en los museos europeos. Ellas son son fabricadas por los Chiriguanos mismos así por medios varianos y son vendidos a los indios. La forma exterior es todavía la de pinzas, muy agrandadas. Pero también sin contar en tamaño la bolvera de hoy no se puede emplear como pinzas para sacar pelos porque las dos partes

de su borde inferior han sido suldados. El hecho de que la ornamentación de su superficie no es indaria primordial se explica de que los Chiriguanos no son los fabricantes de esos adornos.

VESTIDO y ADORNO.

Del siglo XVI poseemos la corta descripción de los Chiriguanos por el obispo Lizarraga (133) en la que, entre otras cosas se dice: «Andan desnudos, cuando mucho cuál o cuál tiene una camisetilla hasta el ombligo.» Podemos suponer que esta indicación del Obispo de aquel tiempo se refiere solamente a los hombres de los Chiriguanos, porque se recuerdo que las mujeres Chiriguanas ya en el tiempo de su inmigración usaron, como lo sabemos de las mujeres Guaranies de la Provincia antigua del Uruguay (134) un vestido que cubria sus organos genitales. Es recuerdo que ese vestido tenia la misma forma como el «tipoy» que es un vestido en forma de una manga y sin costura y hasta hoy todavia muy común entre las mujeres Chiriguanas y Chaná como también entre diversas otras tribus de indios de America del Sud.

Los hombres de los Chiriguanos y Chaná, que yo he visto, estaban vestidos de la manera europea tal como es, según Nordenskiöld, hoy costumbre común entre ellos (135). Pero muchos de los hombres Izaná a los que encontré en Toledo, no tenian un tal vestido europeo completo. Varios de ellos no tenian camisas y varios otros, especialmente los menos y muchachos, andaban sin calzones. Pero, sin duda, este estado era solamente transitorio, producido por la situación excepcional de los Izaná traslados a Toledo desde sus comarcas habituales. Cuando yo repartí trajes en Toledo a esos indios, se acercaron todos los que tenian escasés de ropas. Al dia siguiente, fué más visible esta carencia entre los atraidos por los donativos hechos el dia anterior. Vimos entonces a la mayor parte de los menos llegar sin calzones porque habian visto que fueron favorecidos el dia anterior los que no tenian tal prenda de vestir.

De vestidos indígenas los hombres usan todavia el llamado «chiripá», el poncho y la simple manta. Según Nordenskiöld (136) ellos traen algunas veces todavia una camisa «tirasunhai» que consiste en un poncho cuyos dos lados han sido unidos por costura hasta las aberturas para los brazos.

El chiripá consiste en un pedazo cuadrangular de género que pasa por entre las piernas y cuyos dos extremos son sujetos, por atras y por delante, con una cinta. El chiripá, vestido de esa manera, cubre los órganos genitales. La figura 11 representa un muchacho Izaná vestido con tal chiripá. También Nordenskiöld representa por su dibujo un muchacho Chaná vestido con el chiripá (137) Según este autor, el chiripá es usado también muchas veces por los hombres Chiriguanos y Chaná cuando estan trabajando.

El poncho es un vestido hasta hoy todavia usado en común por los hombres y muchachos Chiriguanos y Chaná durante la estación fria. La figura 17 muestra un muchacho Chiriguano vestido con el poncho. Porque hoy los ponchos como las lajas son un artículo muy solicitado por los blancos y muchas veces se fabrican para el comercio, yo procuré adquirir solamente ponchos usados por los indios mismos.

Para explicar las medidas arriba mencionadas tenemos que decir que las medidas del largór se refieren al largór entero del poncho extendido. Como muestra la figura 17 el poncho se usa a la manera que la hendidura, estando en el centro es llevado encima de la cabeza de modo de que la hendidura está en la dirección del eje mediano del cuerpo humano y la mitad del poncho pasando los hombros, pende para adelante y la otra mitad para detrás. Pues corresponde la distancia entre el borde inferior del poncho y los hombros del hombre que viste el poncho, a la mitad del largór del poncho extendido. Solamente de dos ponchos de lana de los Izoció, la mitad del largór es igual a la anchura. La fabricación y la ornamentación de esos ponchos las trataré en los capítulos relativos a la técnica de tejer y al arte.

Los Chanés del Rio Parapití visten todavía muchas veces mantas, tejidas de lana, las que ellos usan también para dormir encima o para cubrirse con ellos cuando están durmiendo. (138) Yo he adquirido 9 de esas mantas de los Izoció de las cuales cuatro habían sido hechas de ponchos, habiendo cerrado con costura la hendidura en el centro de ellos. Entre las otras cuatro mantas las que han sido fabricadas luego como mantas, las relaciones entre el largór y la anchura pueden ser muy diferentes. Hay algunas de forma casi cuadrada y otras, que son tres veces más largas que anchas. De los Chiriguanos, en Macharetí, recibí solamente un tejido correspondiente a esas mantas que ya está muy remendado.

MANTAS DE LA COLECCION

Ya mencioné las fajas, hoy usadas por los hombres Chiriguanos a modo de cinto, en el capítulo sobre corte y peinado del cabello y adornos de la cabeza. La fabricación y la ornamentación las trataré en los capítulos relacionados a la técnica de tejer y al arte.

FAJAS (Iouh: kouhá) DE LA COLECCIÓN

I. A. 420-441. (Chiriguano).
I. A. 730; 803-807. (Ianá.)

Solamente la faja de los Ianá I. A. 730 representada en la figura 414, que mide 1,30 m. de largur y 3,7 cm. de anchura, se diferencia respecto a la técnica de su fabricación y sus ornamentaciones, las que tienen que referir a influencias extrañas, a las demás fajas coleccionadas entre los Chiriguanos e Ianá. Estas corresponden bastante exactamente las unas a las otras respecto a sus dimensiones, la técnica de tejer y su ornamentación. Mas, estas fajas de los Ianá son siempre tejidas exclusivamente de algodón y las fajas de los Chiriguanos de lana fuera de una (I. A. 434) cuya urdimbre contiene no solo hilos de algodón sino que también hilos de lana. Todas esas fajas son menos largas de 2 m. La faja más larga de los Chiriguanos mide 2,06 m., la más larga de los Ianá 2,70 m. La anchura de las fajas de los Chiriguanos varía entre 8,5 y 16 cm., aquella de los Ianá entre 10 cm. y 19,5 cm.

Hecho más que los hombres, las mujeres y niñas han conservado su traje primordial consistente en el tipoy. Como muestran las fotografías representadas en las figuras 3, 4, 6, 12 y 14, la camisa moderna o la chaqueta de género moderno han completado muchas veces el tipoy, pero no lo han complicado. La mujer y las tres hijas del cacique de los Ianá representadas en la figura 12 están vestidas del tipoy y también casi todas las mujeres Chiriguanas representadas en la figura 4. Ciertamente las más de las veces, el tipoy es usado como una falda, siendo arrollada su parte superior alrededor de las caderas como una larga cinta. La mujer del cacique y la hija más vieja representadas en la figura 12 han puesto la parte superior del tipoy encima de su hombro. La mujer más vieja representada en la figura 14 viste el tipoy a la manera primordial amarrando sus agujas o espinas de cacto por encima de los dos hombros, (139) del que quedan dos aberturas para poder pasar los dos brazos. Fotografías representadas por Nordenskiöld (140) y v. Rosen muestran que existen todavía otras variaciones en la manera de vestir el tipoy.

De los Ianá he recibido tres de sus tipoys de los cuales dos han sido tejidos de algodón y uno de lana.

TIPOYS DE LA COLECCIÓN

I. A. 832. Ianá.	De algodón.	Largur	1,31 m.	(Fig. 113)
I. A. 833. "	De lana	"	1,61 m.	
I. A. 834. "	De algodón	"	1,37 m.	

Nota 139. Comparar N. Rosen l. c. p. 98.
Nota 140. Ibidem l. cit. 98.

Una especialidad de este tipo de los Chaco-Indios y también de los Chiriguanos en comparación con todos los tipos que conocemos de otras tribus, es su grande tamaño y podemos decir que este tipo bajo sido tan grande en los tiempos anteriores. La indicación de Vieira, (141) que las mujeres Chiriguanas habíanse vestido enteramente en pedazo de género alrededor de sus cuerpos contrata la respuesta contraria. De la fabricación y de la ornamentación nos ocupará en los capítulos sobre la técnica de tejer y el arte.

De los adornos de los Chiriguanos y Chaco ya han sido mencionados en los capítulos antecedentes los adornos del tobillo, el tembeta, el adorno de hombro en forma de plumas para sacar pelos y los anillos, actualmente usados por las mujeres. De otros adornos tienen importancia solamente los collares de las mujeres. La mayor parte de las mujeres fotografiadas por mí estan provistas de collares (ñoñ'E), los que consisten exclusivamente de materiales importados como abalorios, pedazos de metal y monedas como, y por eso no tienen importancia etnológica. Sorprendíbile sólo entre esas tribus, collares compuestos de conchas de tortugas y «chrysocolla» y de semillas negras. (142) V. Rosa representa por dibujo en tal collar de los Chiriguanos compuesto de conchas de tortugas y abalorios. (143) Según esos autor esos collares fueron usados algunas veces también por hombres. (144) También encontramos todavía agujas de plata para sujetar los tipoys, en forma de las de los Peruanos antiguos. Pero también aquellas no son el producto de una industria primitiva, sino si recibidas de plateros europeos. (145)

Al fin mencionos aquí un anillo recibido por el P. Ayala Sala de los Chiriguanos y donado por él al Museo de Historia y Etnografía del Paraguay. El anillo ha sido hecho del metal de la capsula de un cartucho de arma de fuego.

ANILLO (mokkarupa) DE LA «COLECCION

I. A. 1321. (Chiriguano). Donación del P. Ayala Sala. Diámetro 2 cm.

El «origen de los Incas» representado en la figura 12 «alas mandalas» (Chir. antiguas Inca: yñaqá). Por lo cuales los hombres y las mujeres ambos diferían. Pero los dos «ojos» «las mandalas», si ambos contan de una «cara pulpuna o «ojuna. (146)

La región de la propagación de la mandala en la América del Sud nos hace suponer que los Chiriguanos no han recibido primariamente esta prenda de los blancos sino ya antes y proveía de la cultura de los Peruanos antiguos. (147)

TRATAMIENTO DE ENFERMEDADES Y OFRENDAS

En el establecimiento de los indios en Toledo estaba arreglado un pequeño hospital en el que los Indios enfermos recibían tratamiento medico. Por eso no tuve ocasión de hacer entre ellos investigaciones sobre el tratamiento indígena de las enfermedades de esos indios. Tampoco en Machareti tuve ocasión de hacer tales investigaciones. Por eso, me remito a las investigaciones de

Nordenskiöld y Métraux hablan en punto a esto, (148) y quiero aquí solamente mencionar que también entre los Chiriguanos y Chaná, como entre la mayor parte de los demás indios de la América del Sud existe un médico profesional a quien corresponde el tratamiento de los enfermos, considerado este tratamiento, lo mismo de las tribus, también entre esos indios, es hechicerías. El médico intenta alejar el mal, empuja objetos «dañosos», provocados dentro del cuerpo del enfermo hechizado. Además de tal tratamiento explícase entre los Chiriguanos y Chaná remedios y, sea, fuera de remedios consistiendo en substancias vegetales, también la grasa de diversos animales usada exclusivamente para las diferentes enfermedades. Las heridas los Chaná las tratan con agua hervida.

El aspecto verificase entre los Chiriguanos y Chaná que vivos fuera de los ataúdes, por lo cual habría conforme a la costumbre primordial, en urnas. Según Nordenskiöld (149) los grandes potes para preparar la chicha son también usados como urnas funerarias, y una otra vasija sirve para tapar la urna. Dícese nunca el moribundo ya antes de estar muerto completamente, o largo después de la muerte es apretado por dentro de la urna en «cubillo». Una calabaza con agua se pasa junto con el muerto en la urna y esta es enterrada dentro de la cova. Por la cuenta la casa, después del aspecto, es abandonada por algún tiempo, pero esta tarde otra vez habitada. Una tal urna funeraria de los Chiriguanos del valle de Guipuzcoa es representada por dibujo por Erland Nordenskiöld. (150) Hasta la mitad la urna, provista de una tapa, está desenterrada. Importante es la indicación de Nordenskiöld de que los Chiriguanos usan los mismos potes que sirven a la preparación de las «vasijas» funerarias. De esto podemos deducir que los usos funerarios hallados también en otras regiones tuvieron lugar en vida, durante la vida del muerto, enterrado dentro de «la», a otros destinos relacionados a la economía de esta tribu.

JUEGO

De los diferentes especies de juego encontramos entre los Chiriguanos y Chaná los de movimiento, los juegos de habilidad y los juegos de azar. Pero los juegos de movimiento solo son practicados por los niños.

Entre los juegos de movimiento tenemos que mencionar aquí, principalmente el juego de pelota, gripada con la cabeza. Nordenskiöld lo visto a los muchachos de los Chaná jugar así. Una pelota de goma maciza, primero colocada al «la», dos partidas la «chutan», con la cabeza, sin que la toquen con la mano. Este juego llamado por los Chaná «tuki», sin duda, antes era mucho más común y practicado también por los adultos. Era un «final» el regreso de los Jesuitas en Toledo y lo «tuki» efectuado ya mucho antes por el autor de «Lettres Annues» del año 1616 respecto a los Chaná (151). Era «suelto» también de una leyenda de los Chaná apuntada por Nordenskiöld (152) Según esta leyenda el nuevo «Agaravirangue» se pone en libertad al «cuidar blanco» si «se con la condición de que le procure la pelota blanca de goma. En lo que sigue la leyenda describe minuciosamente como el primero el «ventrio» «Tauhi» juega con el «ventrilugo» «Ludiro» con esta pelota bailándola con la cabeza. Tanto el «Tauhi» blanco salió «cuando junto con la pelota blanca el Demonio Agaravirangue «medio a su pajero a buscar la pelota negra de goma y con esta juega el pueblo «nuevo y, el «ventrio» «Tauhi» esta vez con el nuevo Agaravirangue.

[illegible]

Este tiraba su pelota con una piedra y echaba esta al encuentro del avestrúz Rheo, parando la piedra con la cabeza, murió.

Esta leyenda de la cual mencioné aquí solamente las partes que se refieren al juego de la pelota golpeada con la cabeza nos dá aclaraciones interesantes sobre ese juego de los Chanés, en diversos puntos. En primer lugar ella nos muestra que era difícil para los Chanés, el procurarse dentro de su territorio la substancia necesaria para esas pelotas, porque allá no hay goma. Como los Chanés hoy compran esas pelotas de goma en Santa Cruz de la Sierra también antes ellos debían procurarselas de lejos. Además, tiene interés la distinción entre dos diferentes especies de pelota en la leyenda, la pelota blanca y la pelota negra. La pelota negra corresponde sin duda aquella pelota de goma, maciza, con la cual los muchachos de los Chanés todavía hoy practican ese juego, mientras que la pelota blanca, sin duda, corresponde a la forma de pelota con la cual, en el año 1910, he visto jugar a los Cosaríel - Parenis o Parresi - Kabichis. Esta pelota de goma, clara, más o menos blanca, de los Paresi - Kabichis era hueca y por eso apesar de su tamaño relativamente grande, muy liviana y elástica y por eso mucho más propia para golpearla con la cabeza que una pelota de goma, maciza y dura. Por desgracia Nordenskiöld no da ningún dato sobre el tamaño de las pelotas de goma, macizas de los Chanés, pero tenemos que suponer que ellas son chicas, porque el choque con una pelota de goma maciza del mismo tamaño como él de las pelotas huecas de los Paresis - Kabichis tiene demasiado fuerte para una cabeza, especialmente para una cabeza de un muchacho. En varias leyendas de los Parenis en Utiariti (Matto - Grosso) las que apunté en el año 1928 pero todavía no publiqué, figura el juego con la pelota golpeada con la cabeza. También en estas leyendas son las deidades que juegan ese juego y este tiene un carácter absolutamente religioso. Ha relatado que la deidad de la luna, el día antes de esa especie con su hermana juega ese juego con sus hermanos y en una otra leyenda lo juegan, como en la leyenda de los Chanés, demonios animales. La tortuga juega la pelota con el hijo joven del tigre y, siendo su pelota de piedra ella lo mata por el choque dirigido a la cabeza. Pues también hay aquí un paralelo a la leyenda de los Chanés, en la cual el zorro mata al avestrúz con su pelota transformada en piedra.

Nordenskiöld no vió a los Chiriguanos de la Sierra jugar el juego de la pelota golpeada con la cabeza, pero oyó contar que, antes, ellos practicaban este juego llamado «bendi» por ellos y, eso, como los Chanés con pelotas de goma macizas. (153) En mi trabajo, publicado en esta revista, (154) ya he mencionado que según las «Litteres Annuae» del año 1589 (155) el juego con pelota golpeada con la cabeza era practicado también por los Itatines-Guaraynis y eso sin duda con una pelota de goma, hueca, porque ella es descrita en aquel lugar como muy liviana. Eder (156) menciona este juego con pelota golpeada con la cabeza en el año 1791 por los Matacos, los que no sólo usaban pelotas de goma blancas y huecas sino que también usaban pelotas oscuras y macizas. Diversos autores más antiguos y más recientes, por ejemplo Fernandez y de Orbigny mencionan ese juego entre los Chiquitos (157). Nordenskiöld, en sus viajes, lo ha visto jugar, fuera de los Chanés, a los Huari. (158)

Según esos datos sobre la región de propagación del juego con pelota golpeada con la cabeza, tenemos que suponer que los Chanés, ya antes de su sujetación por los Chiriguanos hayan conocido ese juego y, que los Chiriguanos de

la Cordillera, como los Itatines - Guarayús le han recibido desde temprano de los Chanés. Los Chiguanos usan también el juego de pelota hecha de hojas de maiz y golpeada con la mano lo que conocemos de muchos otros indios Sudamericanos (159). Según Métraux no se juega este juego sino en el tiempo cuando el maiz esta madureciendo y está relacionado del cultivo del maiz.

Respecto a otros juegos de movimiento, los muchachos de los Chiriguanos juegan un juego que corresponde al juego de polo y es muy común entre las tribus del Chaco. Los Chiriguanos lo llaman «taca». La pelota es golpeada sea, como entre los Chorotes y Churupis, con palos encorvados, sea con una raqueta primitiva. (160) Sin duda los Chiriguanos recibieron ese juego de las tribus circunvecinas del Chaco.

De los juegos de habilidad, solamente uno es jugado por los adultos y eso solamente por las mujeres. Es una especie de juego de bolo lo que los Chiriguanos en Tibuipa llaman «itarapóa» y los Chanés del Parapiti «tecorôre» (161) Los bolos de ese juego consisten en dos hileras de granos de maiz, dos a dos, uno encima del otro, o en un marlo. Es echado con bolas de piedra o con una pelota hueca de barro cocido provista por dentro de bolitas hechas de la misma materia. (162)

Tres otros juegos de habilidad, descrito por Nordenskiöld, son jugados solamente por muchachos. (163) Para uno de esos, llamado «sóuki» son empleados dos flechas provistas de marlos (164). Esos dos juegos son practicados por los muchachos de los Chanés del Parapiti.

El tercer juego llamado «parama», Nordenskiöld lo vió jugar a los muchachos de los Chiriguanos en el valle de Caipipendi. Con piedritas redondas, echadas con pedazos de barro cocido, se intenta derribar un botón, o tal cosa, de una piedra.

Recibí de los Chiriguanos en Machareti algunos juguetes de las criaturas los que pertenecen a esos juegos de habilidad.

LAMINA XIII

El juguete representado en figura 36. a, llamado «mou - mou» por los Chiriguanos, se compone de un chico disco de calabaza con borde dentado y un hilo doble. Este pasa por dos agujeros del disco. Por torcerse y estirarse alternativamente ese hilo, produce una rotacion rápida del disco junto con un ruido corriente. De otros juguetes de las criaturas de los Chanés son representados por dibujos por Nordenskiöld un cerco junto con chicote, un intrumento de musica consistiendo en dos arcos (167) y un mosquete chico. Con tales mosquetes juegan también las criaturas de los Chiriguanos en el valle de Caipipendi y de los Chorotes. (168)

De los juegos de habilidad tenemos que mencionar, al fin, los juegos de hilo de los cuales algunos son representados por dibujos por Métraux, los cuales un hombre Chiriguano hizo para él. También los niños de los Chiriguanos conocen este juego.

De los juegos de azar existen dos entre los Chiriguanos y los Chanés. Uno, llamado por los Chiriguanos «chúcaráy» y por los Chanés «chunquanty» es jugado con cuatro tablitas, y el otro, llamado «asúcareta», con un gran número de tablitas, cóncavas de un lado y convexas de otro lado. (170)

De los blancos esos indios recibieron dos juegos de azar, el juego de dados lo que llaman con el nombre español «daro» y el juego con un hueso de la pierna de una vaca lo que llaman «taba».

AGRICULTURA

Ya en el capitulo relativo a comida y bebida he explicado que es común como producto de la agricultura el cultivo del maiz y entre los Chanés del Parapití, el cultivo de la batata dulce. La mandioca no es cultivada sino pocas veces y no tiene importancia en la economía de esos indios. Diversas especies de habas son plantadas, además una especie de cacto, algunas calabazas que tienen frutas comestibles y también poco tabaco. A estas plantas comestibles o exitantes indígenas que son plantadas, se agregan algunas otras recibidas de los blancos, pero estas tienen poca importancia en la economía de esos indios. Según Nordenskiöld (171) son estas las siguientes: La caña dulce, el maní, la sandia, el melón, el higo, la naranja y el mijo y, por Métraux, es mencionado entre ellas también el plátano. (172) Fuera de estas plantas comestibles o exitantes son cultivadas diversas especies de calabazas, cuyas frutas no son comestibles pero sirven para fabricar vasijas; algodón para fabricar hilos; urucú para ganar el tinte colorado y entre los indios del Parapití también una especie de caña, Harundo Donax, que crece, en gran cantidad, silvestre en los bordes del Pilcomayo, pero no en los del Rio Parapití.

La especie de agriultura que en común practican esos indios es aquella que podemos determinar por la palabra «el rozado», la que corresponde el mejor al término técnico alemán: «Waldrodung» usado para este concepto. Un pedazo del monte es rozado y la tierra, en esta manera cultivada, es tantas veces plantada hasta que esté agotada. Según Métraux (173) el lugar destinado a la plantación es primero limpiado del yuyo que es cortado con un gran palo provisto de un corte en sus dos cortados, y que es cremado en el lugar mismo. Métraux

ha compilado de la literatura también las respectivas indicaciones sobre la manera de la siembra del maiz. (174)

Los utensilios usados para este cultivo son recibidos casi todos de los blancos como palas y azadas de hierro. La pala, hecha de madera la que los Chiriguanos recibieron, sin duda, de la cultura de los Peruanos antiguos y que antes era usada universalmente por ellos es hoy muy rara. (175) Según Nordenskiöld esas palas consistian en madera dura y eran provistas de un mango artificialmente formado. Dos de tales mangos de palas provistos con un asidero especial en su extremo superior son representados por dibujos por Nordenskiöld y dos semejantes por Métraux (176). En las leyendas de los Chanés, apuntadas por Nordenskiöld, se menciona fuera de la pala, también el punzón de madera, que es un utensilio de agricultura muy común entre la mayor parte de los indios de la America del Sud que tienen agricultura. En una de esas leyendas se dice (177) que Tunpa, después de haber creado los abuelos de los Avás (Chiriguanos) y de los Chanés les dió una pala de madera y un palo largo y entallado, llamado «carumpa» y flechas y arcos para que se alimentasen con esos utensilios. En la otra leyenda se cuenta que el tigre va a buscar los punzones cuando el zorro quiere ayudarle a sembrar su chacra (178) De las indicaciones de Métraux mencionadas en lo que precede sigue que los Chiriguanos usan todavia un tal utensilio de madera para su agricultura.

Los Chiriguanos en Machareti tenian algunas plantaciones cerca de su pueblo pero por causa de la seca extraordinaria de aquel tiempo, ellos no habian producido nada. Los Izoños cerca de Toledo habian rozado grandes terrenos pero por la misma causa no podian plantar. Según Nordenskiöld (179) las grandes plantaciones de los Chiriguanos y Chanés están muchas veces lejos de sus pueblos y están cercadas con materrales.

CRIA DE GANADOS

De animales domesticos, primordiales en la America del Sud, los Chiriguanos y Chanés tienen el perro sudamericano, quien, hoy, está mezclado con la sangre de los perros europeos. (180) Porque los Peruanos antiguos criaban diversas razas de perros podemos suponer que los Chiriguanos recibieron el perro como animal doméstico de los Peruanos antiguos. Lo mismo podemos suponer respecto al pato, el que también era criado por los Peruanos antiguos. Por eso yo no hago entrar el pato en los animales domesticos que recibieron esos indios de los blancos como hace Nordenskiöld. No sabemos si los Chiriguanos en tiempos pasados hayan criado la llama. Del hecho de que existen en el territorio situado entre el Rio Parapiti y el Rio Grande, Guanacos, podemos suponer que la cria de aquella otra especie de Eschenia fuese posible en aquel pais.

Ya temprano los Chiriguanos recibieron los animales domésticos europeos como el caballo, el asno, el vacuno, carneros, cabras, chanchos y gallos y gallinas, los que ellos capturaron en gran cantidad en sus correrias continuas emprendidas contra los colonos españoles. Repetidas veces quejase en los documentos del siglo XVI del extenso robo de ganado hecho por esos indios. Hoy los Chiriguanos y Chanés no tienen muchos caballos y nunca ellos han tenido el caracter

pronunciado de una nación de jinetes. Las armas verdaderas de guerra eran antes un arco largo y flechas también largas, que no se pueden usar cuando el jinete está montado, además de que antes sus domicilios estaban en las cercanías en regiones en las que también los Españoles no pudieron alcanzar a entrar montados. En ciertas partes de su territorio la cría de vacuno tiene alguna importancia. (181) Más general es la cría de carneros, cerdos y gallinas. Hoy se encuentran entre ellos algunas veces también gallinas de Guinea y pavos. (182)

Animales silvestres domesticados se encuentran pocas veces en el interior de sus casas, sino que ellos tienen algunos loros. (183)

CAZA

Anteriormente hemos explicado que, por consecuencia de la carencia de animales que pueden comerse en el territorio de los Chiriguanos y Chanés, la caza tiene un caracter secundario entre los medios para su alimentación y, conforme a eso, conocemos por documentos antiguos que las plumas para sus flechas eran entregadas a los Chiriguanos por otras tribus de indios, que eran sus tributarios (183) La cría del ganado doméstico les da más ocasión de procurarse alimentos animales. Conforme al hecho de que los Chiriguanos, por lo menos hoy, no son excelentes cazadores, el método de cazar más común entre ellos es el uso de trampas. (184) Nordenskiöld describe tres especies diferentes de trampas que las tres sirven para prender aves. (185) La primera especie consiste en un simple lazo y es usado con ayuda de reclamos. La segunda especie, que es común entre otras diversas tribus de indios, es usada, por ejemplo, también por los Kaingua. La tercera especie consiste en una red que consta de dos partes y es asegurada al suelo por medio de estacas. En una de las leyendas de los Chanés, apuntadas por Nordenskiöld, se menciona una trampa para prender palomas. (186)

Solo accidentalmente son usados para cazar, arcos y flechas, así que hoy ya es difícil coleccionarlos entre esos indios. De los Ituzaé yo pude adquirir diversos arcos y flechas y de los Chiriguanos un pequeño arco para criaturas y diversas flechas. Entre éstas también dos ejemplares para matar aves, provistos de una maza en la punta. Porque muchas veces, en caso particular no podemos decidir, si una especie de flecha es usada exclusivamente para la caza o para la pesca o para estos dos destinos, enumeraré todas las tipos de flechas juntas en el siguiente cuadro.

I. A. 753. " Largúr 0,965 m. Punta de hierro; su largúr 21,5 cm. Asta de caña. Tal vez con emplumación.

De las 7 arcos de los Izozo, los 4 primeros de la lista son buenos ejemplares hechos de madera dura, y corresponden en todos los detalles exactamente a los arcos de los Chiriguanos descritos por v. Rosen (187) excepto, solamente su largúr, que tiene algunos centímetros menos que el largúr de estos. Esa diferencia en el largúr se explica bien de que esos arcos de los Chiriguanos ya fueron coleccionados por v. Rosen en los años 1901 y 1902. Hoy sería difícil encontrar entre los Chiriguanos todavía arcos tan largos como aquellos que adquirió v. Rosen hacen 35 años. De la indicación de Lizarraga de que los arcos de los Chiriguanos tenían el mismo largúr como el que tenía el tirador, resulta que los arcos de esos indios antes eran todavía más largos que los descritos por v. Rosen. Si nosotros proponemos según las mediciones antéricas de Lehmann-Nitsche, mencionadas en lo que precede, por término medio de la altura del hombre Chiriguano una altura de 1,63 m., hay, entre este número y el número de 1,65 m. que indica el largúr del arco más largo entre los arcos coleccionados por v. Rosen, tuviera una diferencia de 10 cm. Tenemos que tener esta reducción del arco de los Chiriguanos y Chaná, sucesivamente progresando, por una consecuencia de su degeneración producida por su caer paulatinamente en abuso.

La forma de todos los arcos coleccionados entre los Izozo es la misma, sin contar las diferencias insignificantes respecto a su largúr. La madera del arco, teniendo más o menos 3 cm. de anchura, es plano del lado que se dirige a la cuerda y convexa al lado contrario. Para poder asegurar mejor la cuerda del arco, cada uno de estos está provisto en sus extremos, de una reducción distintamente marcada y siempre al extremo superior bastante más corta que al extremo infe-

Nota del v. Rosen. l. c. p. 245 Sub.

rior. Tres de esos arcos de los Isoseño muestran, estando su tensa, la forma recién ya mencionada por v. Rosen con respecto a los arcos de los Chiriguanos. La cuerda del arco consistiendo en tiras de piel de animal, torcidas, se halla amarrada a la manera común que lo hacen los indios de la América del Sud. Por medio de un lazo provisto de un nudo, ella rodea la reducción del extremo superior del arco, mientras que el lazo del extremo inferior, está hecho de manera que se pueda efectuar conforme a la necesidad, ora una reducción ora una prolongación de la cuerda del arco. Compare figura 37. a y b. En todos esos arcos una grande parte de la cuerda está arrollada como reserva al rededor de la madera del arco. El arco I. A. 757 cuya madera muestra handiduras del lado que se dirige a la cuerda, tiene en dos partes refuerzos de la madera consistiendo el uno de estos en su envolvimiento con hilo y el otro en un pedazo de la piel de la cola de ganado vacuno que pasa en forma de una manga la madera del arco. Compare figura 37.

Los tres arcos I. A. 758 - 760, hechos de una madera clara, corresponden, respecto a su forma, a la de los otros, pero han sido fabricados mal y aparecen con una ornamentaría mala, destinada a hacer negocios. El arco I. A. 760 tiene hasta un alambre de cobre, en lugar de la cuerda.

El arco chico de los Chiriguanos, I. A. 918, es un arco destinado a los muchachos para tirar con flechas bien provistas de una punta de alambre, de las cuales se han enumerado en gran número en la lista precedente.

El largo de las flechas coleccionadas por mí entre los Chiriguanos 4 largos en queda bastante atrás con respecto al largo de los arcos correspondientes. La más larga entre ellas es una flecha de los Chiriguanos para tirar a las aves, provista de una maza en lugar de la punta, teniendo su largo de 1,11 m. Entre las flechas provistas de punta de hierro, un ejemplar de los Isoseño alcanza el largo de 1,07 m. y un ejemplar de los Chiriguanos, el largo de 1 m. Esto es lo contrario de las observaciones que hizo v. Rosen sobre las flechas de los Chiriguanos, las que eran tan grandes o tenían más grandes que los arcos.

Sin contar las flechas de los Chiriguanos provistas de puntas de alambre las que, sin duda, por lo común no son usadas sino por los muchachos para tirar a pájaros o a aves y las que son muchas veces provistas de astas de madera, las astas de las flechas consisten universalmente en caña, extraídas de la planta Arundo Donax, lo que, como ya mencioné en lo que precede, es cultivada por los Chaná del Río Paraguay. Según Nordenskiöld, los Chaná antes han usado también el Uká (Cymorium sp.) que llaman «Ibirbiro» (168). Las flechas coleccionadas entre los Isoseño están provistas de puntas de hierro. Nordenskiöld, representa por dibujos también flechas de los Chaná provistas de puntas de madera, en forma de una lanceta, o, dentelas. (169)

Entre las flechas de los Chiriguanos existen en la colección dos provistas de puntas de hierro, una provista de punta de madera, dentada, una tal punta de madera sin asta y dos flechas para matar aves, provistas de una maza en lugar de la punta. Las flechas provistas de punta de hierro, de los Chiriguanos corresponden respecto a la forma y la substancia, completamente a las de los Isoseño. La punta de hierro está jostada con el asta por medio de un pedazo de madera hendida, y de un envolvimiento de hilo, hecho de una cortina especial de un tejido y adornado con cera. El extremo inferior de la asta de caña está provisto de una estalladura encima de la cual el extremo de la flecha es también adornado por un envolvimiento con el mismo hilo y adornado con cera.

(168) Nord. I. p. 31.
(169) Nord. I. Fig. 5. a y d.

Algunas de las flechas de los Chiriguanos é Izozóe tienen emplumación, otras no. Mientras que la emplumación de algunas de las flechas que ahora no la tienen, se perdió posteriormente, como se puede conocer de los restos de cera que servía para asegurarla, otras flechas muestran claramente que nunca tuvieron emplumación. Si hay emplumación, las partes de plumas aseguradas por medio de envolvimiento con hilo y de cera, son pequeñas como las de la mayór parte de las tribus del Chaco. En el esquema combinado por Herrmann Meyer para los diversos tipos de flechas sudamericanas, la emplumación de las flechas de los Chiriguanos y Chaqueños corresponde a aquella que este autor llama «Peruanische Pechfiederung». La flecha de los Chiriguanos provista de una punta de madera, dentada, se diferencia de las demás flechas por ser su punta asegurada directamente al asta sin intermediar un pedazo especial de madera. Por lo demás, la forma de su asta provista, en este caso, de una emplumación, corresponde a la forma de las astas de las flechas provistas de punta de hierro. V. Rosen (190) v. Nordenskiöld (191) y Métraux (192) representan por dibujos, diferentes tipos de flechas de los Chiriguanos provistas de punta de madera.

Métraux halló entre los Chiriguanos en el valle de Caipipendi muchas veces flechas provistas de dos puntas de madera, dentadas, las que los jóvenes usaban especialmente para tirar a los yacú (193)

De las dos flechas de los Chiriguanos para tirar a aves provistas de una maza al extremo superior, en lugar de la punta (sóngo), solamente un ejemplar, I. A. 534, puede ser tenido por un ejemplar típico. Ella es, como ya mencioné, la flecha más larga de la colección. La otra flecha para tirar a aves, mucho más corta y mal hecha, sin duda servía solamente a los muchachos. La forma de las mazas de esas dos flechas (compare fig. 37. e.) es la misma y corresponde también a la forma de las flechas de esta especie, las que representan por dibujos v. Rosen y v. Nordenskiöld. (194) Esta maza está afirmada directamente por dentro de la parte superior del asta. El asta de la flecha mayor consiste en la misma caña como las de las demás flechas y la de la flecha menor, en madera liviana. El envolvimiento en la parte superior y también en la parte inferior del asta de la flecha más larga, consiste en hilo de algodón, afirmado con cera. Las dos flechas tienen una emplumación y la misma entalladura al extremo inferior del asta. Varios ejemplares de flechas de los Chiriguanos, para tirar a aves, cuyas mazas muestran diferentes formas son representados por dibujos por Métraux (195)

La forma especial de la maza de las flechas para tirar a las aves, (compare figura 37. e.) y la manera especial del envolvimiento del asta con un hilo de corteza de árbol y el largór que, antes, tenían estas flechas, nos hacen suponer que ese tipo de flechas, hoy común igualmente entre los Chiriguanos y Chaqueños, son la forma antigua de las flechas, que los Chiriguanos llevaron de su suelo natal, el Chaco. Ya mencioné que los arcos y las flechas de los Chiriguanos y de los Chaqueños entre ellos más largas. Pero podemos también suponer que esos utensilios de caza y armas de guerra, antes, conforme a su importancia mayór, fueron trabajados mejór que hoy.

Según Nordenskiöld, solo pocas veces aparece entre los Chiriguanos y los Chaqueños el boleador, el arco para echar bolas, y es usado solamente por los muchachos y mujeres. (196)

MACANA DE LA COLECCION

I. A. 817. (Chiriguano). Largór 64 cm. (Fig 38).

La macana de madera, adquirida de los Chiriguanos, está provista en su extremo superior de una dilatación distintamente delimitada del mango, (Compare Fig. 38) y corresponde en eso a las macanas las que conocemos de diversas tribus del Chaco, como por ejemplo de los Tobas; pero no corresponde a la macana de los Chiriguanos representada por dibujo por Nordenskiöld. (197) Esta tiene más o menos el mismo largór, pero no muestra una dilatación delimitada del mango, siendo su extremo superior solamente poco dilatado. Según Nordenskiöld, los Chiriguanos no usan esas macanas sino para la caza de puercos. (198)

HONDAS (tamombeka) DE LA COLECCION

I. A. 508. Chiriguano. Largor de la parte mediana de red 18 cm.
I. A. 509. » » » » » 14 cm. (Fig. 34. b.)

Las dos hondas adquiridas de los Chiriguanos se parecen completamente la una a la otra. Consisten en una parte mediana fabricada con la técnica de red y con hilo de fibras de caraguatá que acaba en cada uno de sus extremos en un cordón. De estos dos cordones uno acaba por un simple nudo y el otro por un pequeño lazo. Esas hondas corresponden a las de los Chaués representadas por dibujo por Nordenskiöld, mientras que la fabricación de la parte mediana de la honda de los Chiriguanos representada por Nordenskiöld es diferente. (199). Los Chiriguanos que tienen conexiones con los Quichuas usan también otro tipo de hondas hechas de lana. (200)

Según Nordenskiöld, antes, los Chiriguanos usaban para cazar el avestrúz, también la baleadora llamada por ellos «churimo». (201)

Todavia tenemos que mencionar que los Chiriguanos adiestran sus perros para la caza, especialmente para la caza de los puercos. (202)

LA PESCA

Porque, como ya mencioné, no hay en todas partes del territorio de los Chiriguanos ocasión para pescar y también los pocos grandes rios que están en su territorio, excepto el Rio Pilcomayo superior no provean sinó pescados de muy pequeño tamaño, la pesca tiene en la economia de la mayor parte de los Chiriguanos solamente una importancia secundaria, aunque ellos aprovechan toda ocasión para pescar.

Entre los Chiriguanos en Macharetí no he visto algunos utensilios destinados a la pesca, fuera de las flechas pequeñas provistas de puntas de alambre, las que sirven tal vez ocasionalmente a la pesca. Pero entre los Isoso adquirí un tal utensilio, consistiendo en una bolsa de red que se cerrada por encima por dos listones de caña asegurados al borde superior. (Compare figura 39.)

Nota 198. Nord. 1 p. 188.
Nota 199. Nord. 2. Fig. 7. a.
Nota 200. Métraux 1 p. 367 y planche VII.
Nota 201. Nord. 1. p. 188.
Nota 202. Nord. 2. p. 61. Métraux 1. p. 366.

UTENSILIOS DE PESCA DE LA COLECCION

I. A. 764. Utensilio de pesca (Ipaé). Largo de los listones 73,5 cm. Ancho de la red 24 cm. (Fig. 39).

I. A. 795-801. Bolsas de red para utensilios como I. A. 764. (Ipaé).

Por la elasticidad de los dos listones de caña asegurados al borde superior de la bolsa de red, se obtiene que la bolsa puede ser abierta por una traslación de los listones de caña. La abertura así producida se cierra rápidamente si la tracción termina. Un tal utensilio de los Chiriguanos del Parapití es representado por dibujo por Nordenskiöld. (203)

De los demás métodos de pesca mencionados, según v. Rosen y v. Nordenskiöld los siguientes: En primer lugar, la pesca por medio de una calabaza puesta al vado del río a la sombra de una rama la que está fijada al suelo cerca de ella. Si los peces atraídos con maíz acidificado se han juntado por dentro de la calabaza, su abertura se cerrada rápidamente con la mano. (204) Además como indios del Río Itiyuru hacen estanques oblongos levantando diques (205) y los del río Río Pilcomayo construyen grandes diques de piedra para la pesca (206) Se dice que en este río ellos utilizan la corteza de un árbol especial para envenenar el agua. (207) Ellos pescan también con anzuelos, los que ellos prefieren hoy de los blancos. Pero puede ser que el anzuelo sea un utensilio de la cultura antigua de ellos. (208) Además, pescan por medio de redes profundas que corresponden a las de las tribus vecinas del Chaco como son los Chorotes, Chunupis, Matakos y Tobas. (209) Pescan también con flechas y, antes, con lanzas provistas de dos puntas. De estas lanzas v. Rosen ha adquirido en su viaje, en los años 1901-1902, totavía un ejemplar de los Chiriguanos, la que ha descrito y representado por dibujo. (210) Entre las flechas de los Chiriguanos y Chanés destinadas exclusivamente a la pesca, tenemos que distinguir dos especies diferentes, una destinada a pescar peces mayores, provista de dos puntas de madera, dentadas, (211) y la otra para pescar peces chicos, provista en el extremo superior del asta, de gran número de espinas de cacto. (212)

ADQUISICION DE LA MATERIA PRIMA DE ORIGEN INORGANICO

Porque eran los tesoros ricos de los Incas y de las tierras confinantes especialmente su riqueza de oro y plata, los que habían estimulado a los Chiriguanos a inmigrar a las regiones confinantes a este imperio, se impone la cuestión de si los Chiriguanos participaron a la explotación de la tierra con ese objeto. Nosotros conocemos sus combates con Guacane y su hermano Condori por causa de las minas ricas de Mayporó y conocemos que los Chiriguanos han poseído por algún tiempo estas minas y han llevado en esta ocasión grandes cantidades de oro y de plata. Pero en esos combates ellos se habían apoderado de la persona de Condori, que era el dueño de esas minas y, se quedaron con él, sujetándola, para que explotase las minas para ellos. Además se poder sobre la región de las minas duró poco tiempo, porque fueron rechazados por el cacique Grigota

---

[illegible]

hasta las cordilleras orientales de los Andes. No tenemos ninguna noticia de que ellos en su nueva patria hubieran tenido ocasión de extraer oro y plata del suelo; tampoco de que ellos mismos hubieran labrado, en medio mayor esos metales. Hoy mismo ellos saben hacer sus adornos de plata o los sustituyen o bien con cuchillas, excepto el solo hecho de que los Chiriguanos fabricaban algunas veces sus tembetás de estaño.

Por la descripción de sus tembetás y collares conocemos que los Chiriguanos poseen algunas piedras semipreciosas. Como Kurtenbáhl refiere (312) ellos, según sus propias indicaciones, hallan las cuentas de turquesa y chrysocol en la tierra ondende existieron habitaciones o donde están ubicadas superiores antiguas.

Mientras que la sal hoy es adquirida de los blancos, antes, era extraída de la tierra, sea en la forma de sal gema, la que sacaban de las minas, cerca de San Luis, sea en la forma de agua salada que ganaban tratando por agua la tierra de las barreras llamadas «yokie» (314).

PRODUCCION DEL FUEGO.

Por los Chiriguanos y los Chaco hoy son usados para sus utensilios indígenas para producir el fuego. En la casa de habitación, generalmente, se puede producir el fuego de cualquier otro tipo de fuego y para otros usos, ellos se proveen comúnmente de cuchillas inglesas modernas. Además, como ya dije, los Chiriguanos y los Chaco no son grandes fumadores. Un utensilio para producir el fuego que se encuentra indeviá entre ellos es el mbiabia. El ejemplar adquirido por mí de los Chiriguanos está diferenciado de los mbiabiaos de las tribus del Chaco por consistir la pieza en una mecha de algodón bastante gruesa. Según Métraux (311) hallaron entre ellos también la forma conocida del mbiabia constituido la pieza en las palmas de la fruta del palo barroso (Chorisia insignis) guardada en un recipiente de cuerno vacuno o de coco de tatú.

UTENSILIOS PARA PRODUCIR EL FUEGO, DE LA COLECCION

I. A. 516. (Fig. 46.)

a. Bolsa tejida de hilo de algodón como recipiente para los utensilios.

b. Mecha de hilo de algodón.

c. Recipiente para el extremo encendido de la mecha, constituido por el cuerno de una especie de ciervo.

d. Pedazo de una lima moderna, de metal.

e. Pedazo de pedernal.

Como recipiente para el extremo encendido de la mecha, sirve un cuerno de una especie de ciervo. El fuego se produce por golpear un pedernal con el pedazo de una lima moderna, de metal.

De una leyenda de los Chaco apuntada por Kurtenbáhl (315) resulta que los Chaco antes producían el fuego frotando un palito medio de un otro. Según esta leyenda, dos muchachos y una muchacha recibían fuego de un hombre viejo, que no el sol. El «ave Hagi» les aconseja guardar bien el fuego. Si alguna vez se apagaría, debían producir nuevo fuego con el «tinte», lo que no el

utensilio para producir fuego frotando dos palitos. También el cacique de los Isoale preguntado por mi respecto a ese utensilio, lo conocía bien y lo llamaba con su nombre en Guaraní. Nordenskiöld ha visto una vez en Chiriguano que no tenía fósforos consigo, producir fuego con aquel utensilio. (917)

CERÁMICA

El gran desenvolvimiento de la cerámica de los Chiriguanos y Chanés, la máxima variedad de las formas de sus diversos vasijas y sus ornamentos han atraído, ya hace mucho tiempo, la atención de los etnólogos. Nordenskiöld quien indica el número de las variaciones de las formas de las vasijas de esos indios es más de cincuenta, ha publicado un gran número de ellas en contorno y representa también la ornamentación de muchas de ellas por dibujos. (918) También Fritz v. Reuss ha representado por dibujos numerosas vasijas de los Chiriguanos en su obra citada. (919) Métraux describe y representa por dibujos un gran número de las vasijas de barro cocido, de los Chiriguanos. (920)

Una publicación de Félix F. Outes trata especialmente de la cerámica Chiriguana. (921)

Porque, antes, no teníamos en el museo de la Sociedad Científica del Paraguay sino cuatro vasijas de barro cocido y no pudimos de una sola, de los Chiriguanos, que D. María F. de Casati había coleccionado entre ellos y regalado al Museo, yo tenía no intento especial en completar esta serie. Con algún trabajo alcancé adquirir de los indios en Tobodá 41 vasijas y de los Chiriguanos en Sicuaretí, 55 de ellas y, con bastante más trabajo alcancé traerlas enteras y en buen estado de los dibujos al término del largo viaje hasta Asunción.

También estas vasijas de barro cocido coleccionadas por mí muestran grandes variaciones de su forma y de sus ornamentos. Para estas diversas variaciones pueden ser relacionadas, conforme al diferente destino, a algunos grupos.

Las vasijas de barro cocido de los Chiriguanos y Chanés pueden servir á destinos muy diferentes:

1. A cocer comidas y legumbres.
2. A freír comidas.
3. A cocer harina de maíz al vapor.
4. A transportar y guardar el agua.
5. Como recipiente para chicha.
6. Para servir la chicha.
7. Como utensilio de beber, especialmente, para beber la chicha.
8. A guardar comidas.
9. A guardar cualesquier cosas.
10. Como platos para comer comidas.
11. Como base del horno para freír.
12. Como urnas funerarias.

[illegible]

1. VASIJAS DE BARRO COCIDO PARA COCER COMIDAS Y LIQUIDOS. (grupo) DE LA COLECCIÓN.

I. A. 412	(Chiriguano)	Altura	12 cm.	Diámetro máx.	14 cm.	Abertura	12 cm.	(Fig. 48)
I. A. 413	"	"	26 cm.	"	"	26,5 cm.	"	18 cm. (Fig. 46)
I. A. 414	"	"	24 cm.	"	"	23 cm.	"	17 cm. (Fig. 44.)
I. A. 415	"	"	29 cm.	"	"	19,5 cm.	"	14,5 cm.
I. A. 416	"	"	37 cm.	"	"	35 cm.	"	20 cm.
I. A. 417	"	"	29 cm.	"	"	22,5 cm.	"	19 cm. (Fig. 49.)
I. A. 418	"	"	23,5 cm.	"	"	24 cm.	"	20 cm. (Fig. 45.)
I. A. 419	"	"	22 cm.	"	"	23 cm.	"	14 cm. (Fig. 47.)
I. A. 420	"	"	23,5 cm.	"	"	28 cm.	"	20 cm.
I. A. 421	"	"	20 cm.	"	"	22,5 cm.	"	19 cm.

La tropa de estas 10 vasijas de los Chiriguanos, las que están destinadas a cocer comidas o líquidos, no es tan uniformemente variable igual. Solamente la vasija I. A. 412 tendiendo una altura de 12 cm. es bastante menor que las demás vasijas cuya altura varía entre 20 y 30 cm. Solamente de aquella vasija chica es el diámetro de la abertura superior no igual a la altura de la vasija mientras que de todas las demás vasijas el diámetro de la abertura superior es menor que la altura y esto no alcanza nunca tanto como hasta una diferencia de 10 cm. Del alrededor globular de estas vasijas no bien distinguido, por su canto, el cuello, de todas estas vasijas provistas del ornamento bondido. También la parte plana del fondo está bien distinguida por su canto, de la pared. La superficie del alrededor de las vasijas está provista de líneas grabadas, las que son producidas por medio del bruñimiento en la superficie, en estado humedo, barbo con un manto de mate. Solamente de la vasija chica I. A. 412 toda la superficie es llenada del ornamento bondido.

Todas estas vasijas destinadas a cocer son provistas de dos asas, en posición vertical, pasando el borde superior de la vasija y alcanzando la parte inferior del cuello. Las formas de estas asas muestran algunas variaciones de las cuales me ocuparé en el capítulo respectivo al arte.

VASIJA DESTINADA A COCER HARINA DE MAIZ PARA PREPARAR LA CHICHA, DE LA COLECCION

I. A. 422. (Chiriguano) Altura 52 cm. Diámetro máx. 42 cm. Abertura 24 cm. (Fig. 50)

A cocer la harina de maíz para preparar la chicha sirven grandes vasijas de barro cocido las que no alcanzan casi nunca mucho mayores que el ejemplar tratado por mí de los Chiriguanos. Como muestra la figura 50 esta especie de vasija se distingue de las vasijas comunes destinadas a cocer, solamente por su tamaño. La pared del alrededor no bien distinguida del cuello y del fondo plano. El cuello también de estas vasijas está provisto de ornamento bondido. La vasija representada en figura 50 es relativamente alta en comparación con su diámetro máximo y con el diámetro de la abertura superior. Las vasijas para cocer la chicha utilizadas de los Chaná en el Hiyura y presentadas por dibujos por Rudolphi (Ibero, no mencionándolas con su diámetro máximo y el diámetro de su abertura, esta abertura siendo menor. (300)

(300) Ibero (Rud.) I. Atlas 40

2. VASIJAS DESTINADAS A FRITAR MAIZ, DE LA COLECCION

I. A. 400. (Chiriguano) Altura 14 cm. Diámetro máx. 23 cm. (Fig. 53. a.)
I. A. 592. (Isoso) » 10 cm. » » 21,5 cm.

Estas dos vasijas se asemejan mucho una a la otra. Las dos están provistas de dos chicos asideros en su borde. Se diferencian una de la otra solamente en eso de que la distinción del fondo plano a la pared de la vasija de los Isoso es más marcada que en la vasija de los Chiriguanos. Una vasija muy semejante a las dos descritas en lo que precede y oriunda de los Chaná en Río Uruguay está representada por dibujo por Erland Nordenskiöld (223) Por razón de la indicación de Nordenskiöld de que esta vasija era destinada a fritar maíz, tengo también las dos vasijas semejantes de la colección por empleadas a ese destino.

3. VASIJA PARA SOMETER AL VAPOR LA HARINA DEL MAIZ, DE LA COLECCION

I. A. 422. (Chiriguano). Altura 12,5 cm. Diámetro máx. 23 cm. (Fig. 53.)

Esta vasija está provista en el fondo de algunos agujeros redondos, de los cuales uno está en el centro y los demás en dos circunferencias concéntricas a aquel agujero central. Según Nordenskiöld. (224) que representa por dibujo una tal vasija muy semejante sirven estos platos provistos de agujeros al fondo a someter al vapor la harina de maíz con la que ellos preparan una comida que llaman los Chiriguanos «baistimimo». Para ese destino ellos ponen el plato provisto de harina de maíz a la abertura superior de un pote en que hacen hervir agua. (225)

4 VASIJAS QUE SIRVEN PARA EL TRANSPORTE DE AGUA O COMO RECIPIENTE DE AGUA, DE LA COLECCION

I. A. 392.	Chiriguano.	Altura	28 cm.	Diámetro máx.	17,7 cm.	Abert.	4 cm.	(Fig. 54.)
I. A. 393.	»	»	32 cm.	»	» 29,5 cm.	»	9 cm.	
I. A. 395.	»	»	32 cm.	»	» 31,5 cm.	»	13,5 cm.	
I. A. 396.	»	»	32 cm.	»	» 30 cm.		14,5 cm.	(Fig. 55.)
I. A. 589.	Isoso.	Altura	34 cm.	Diámetro máx.	23,7 cm.	Abert.	6,5 cm.	
I. A. 606.	»	»	24,5 cm.	»	» 16,5 cm.	»	3,5 cm.	(Fig. 56 a.)
I. A. 607.	»	»	13,5 cm.	»	» 14,5 cm.	»	13 cm.	
I. A. 608.	»	»	19,5 cm.	»	» 19,2 cm.	»	3,5 cm.	(Fig. 93 b.)
I. A. 617.	»	»	16 cm.	»	» 17 cm.	»	11,5 cm.	(Fig. 56 b.)
I. A. 621.	»	»	28,5 cm.	»	» 16,4 cm.	»	3,5 cm.	(Fig. 93 a.)
I. A. 761.	»	»	40,5 cm.	»	» 27,5 cm.	»	7 cm.	(Fig. 54.)
I. A. 762.	»	»	44 cm.	»	» 34,5 cm.	»	7,9 cm.	
I. A. 763.	»	»	48 cm.	»	» 38 cm.	»	7,7 cm.	

Las vasijas mencionadas en lo que precede tienen en contraste con las vasijas destinadas al cocer, una superficie lisa. También no son pintadas. Esto nos hace suponer que son más destinadas al uso cotidiano que a ocasiones de fiestas y que tenemos que tenerlas en primer lugar por vasijas para agua, con lo que naturalmente no se excluye que ellas sean usadas ocasionalmente para chicha.

Società Classifica
del l'origine

Entre las cuatro vasijas de esta especie de los Chiriguanos, existen tres tipos diferentes. Dos de ellas tienen la forma global del vientre y la distinción bien marcada del cuello y del fondo plano, como las vasijas destinadas a cocer, pero la superficie, también del cuello, está lisa y sin asas sin diferentes. Estas asa, en contraste con aquellas, puestas en posición horizontal a la pared del vientre de la vasija, pero arriba del diámetro máximo.

Las dos otras vasijas de esta especie, de los Chiriguanos, no tienen asas y su abertura superior es, en comparación con la altura, relativamente pequeña. La vasija I. A. 393 tiene un fondo redondo de tal modo de que no puede mantenerse erecta de una base plana. La vasija I. A. 392 tiene fuera de su abertura muy pequeña un cuello cilíndrico, estrecho y relativamente alto, que se puede fácilmente rodear con la mano.

Las vasijas destinadas a agua, de los Ituaín, tienen una abertura superior relativamente muy pequeña. Tres de ellas tienen un fondo redondo de manera que no se pueden mantener erectas de una base plana, mientras que el fondo de las demás es plano. El cuello de todas estas vasijas es muy poco distinguido y el de la vasija I. A. 606 muy corto. La superficie es lisa y no pintada. Las vasijas I. A. 761, 762 y 763 están por dentro de una red, lo que las señala junto como vasijas especiales para transportar agua. La vasija I. A. 616 es señalada como vasija para el mismo destino, por un entrelazamiento de hilo en su parte inferior. Todas esas vasijas para agua, de los Ituaín, no tienen asas fuera de dos pequeñas vasijas divergiendo también en su forma de las demás. Ellas son provistas de dos asas pasando del borde superior en posición vertical. De las demás vasijas, ellas se diferencian también por la abertura superior, relativamente grande. La vasija I. A. 617 está provista de una tira de cuero asegurada en sus dos asas.

Entre las vasijas que sirven como recipientes para chicha, las de los Chiriguanos muestran generalmente formas diferentes de las de los Izozós. La forma de esas vasijas de los Chiriguanos, especialmente las de las vasijas grandes tienen en común la forma global del vientre, (compare las figuras 368, 370 y 377) mientras que de las vasijas de los Izozós, la parte inferior del vientre aumentan hacia arriba y comunmente se distingue por un canto de la parte superior que se disminuye arriba. (Compare las figuras 61, 68 y 69). La superficie de todas esas vasijas es lisa y excepto algunas vasijas de los Izozós, dibujada. Solamente la grande vasija I. A. 397 de los Chiriguanos tiene un fondo redondo; todas las demás vasijas tienen fondos planos, distinguidos por un canto del vientre.

Entre esas vasijas de los Chiriguanos y de los Izozós hay algunas (Compare las figuras 60 y 67) que tienen su diámetro máximo en la abertura superior, lo que les dá la forma de un gran plato. Las vasijas I. A. 397 y 398 se diferencian de las demás por su altura.

De estas vasijas de los Chiriguanos, 9 están provistas de asas y 12 no las tienen. De las 8 vasijas de los Izozós, solamente dos están provistas de asas. (Compare la figura 68. a.) La mayór parte de estas vasijas de los Izozós tienen la especialidad de que su cuello, bien distinguido por un canto, se ensancha bastante hasta el borde superior. (Compare las figuras 61 y 69. a y b.)

6. VASIJAS DESTINADAS A SERVIR LA CHICHA, DE LA COLECCION

I. A. 347. (226).	(Chiriguano)	Altura 18,3 cm.	Diám. máx. 15,3 cm.	Abert. 10 cm.	(Fig. 65)		
I. A. 348. (226).	Chiriguano	Altura 14,5 cm.	Diám. max. 14,7 cm.	Abertura 8 cm.

I. A. 587.	Izozó »	» 18 cm.	»	» 16,2 cm.	» 12 cm.		
I. A. 588.	»	» 14 cm.	»	» 14,3 cm.	» 12 cm.		
I. A. 590.	»	» 13 cm.	»	» 12,8 cm.	» 12,5 cm.		
I. A. 609.	»	» 14 cm.	»	» 12,5 cm.	» 12 cm.		
I. A. 623.	»	» 20,5 cm.	»	» 18 cm.	» 12,5 cm.	(Fig. 66).	

Vasijas como las mencionadas en lo que precede, los Chiriguanos y los Chanés las usan en las festividades de chicha para sacar por medio de ellas la chicha de los grandes potes llenando las cuyas o tazas de barro cocido que hacen circular entre los asistentes a la fiesta.

Entre esas vasijas tenemos que distinguir dos diferentes tipos principales. Las vasijas del primer tipo, tienen la forma global de su vientre, una parte disminuida al cuello, una abertura relativamente pequeña, un fondo plano y una asa vertical puesta en su borde superior y alcanzando la parte superior del vientre. Compare las figuras 74 y 82. a. El segundo tipo, cuya forma es recibida, sin duda, de los blancos, se diferencia del primero, principalmente por su abertura provista de un pico a la manera de las vasijas modernas. Compare las figuras 64 y 65. También las vasijas de este tipo, tienen una asa que, puesta en la borde superior, pasa hasta la parte superior del vientre.

Fuera de esas vasijas encontre entre los Chiriguanos una que corresponde respecto a su forma, a la vasija I. A. 382, ya mencionada entre las vasijas para agua. Ella tiene como aquella un cuello cilíndrico y estrecho que se puede facilmente rodear con la mano y no tiene asa. Por ser su superficie dibujada la he mencionado entre las vasijas destinadas a servir la chicha.

7. VASIJAS DESTINADAS A BEBER LIQUIDOS, DE LA COLECCION

I. A 602.	Inosé.	Altura	10 cm	Diám. máx	12,5 cm.	Abertura	10 cm.	(Fig. 70.b.)
I. A. 603.	»	»	8 cm.	»	9 cm.	»	6 cm.	
I. A. 610.	»	»	8 cm.	»	10,5 cm.	»	8,5 cm.	
I. A. 611.	»	»	9 cm.	»	11,5 cm.	»	8 cm.	

Entre las vasijas adquiridas de los Inosé hay cuatro con forma de tazas. De los tipos de vasijas representados por dibujos por Nordenskiöld (227) resulta que tazas semejantes son usadas también por los Chaná en el Ituyuru y por los Chiriguanos. Tenemos que suponer que la forma de esas tazas sea el producto de la influencia de estilos europeos. Esas vasijas tienen forma global y están provistas de una asa. El fondo de tres de ellas es bien distinguido del vientre, formando un pié. Dos de ellas tienen la superficie dibujada, las demás están sin bibujos.

8. VASIJAS QUE SIRVEN COMO RECIPIENTES DE COMIDAS, DE LA COLECCION

I. A. 394.	Chiriguano.	Altura	17,5 cm.	Abertura	44 cm.
I. A. 401.	»	»	11,5 cm.	»	30 cm.

Dos de los platos de barro cocido que recibí de los Chiriguanos en Macharetí, me parecen demasiado grandes para poder tenerlos por platos de comer, porque Nordenskiöld refiere que (228) los Chiriguanos no comen de un plato común y si cada uno tiene su plato separado. Podemos suponer que se trata de vasijas empleadas como recipientes para comidas o fuentes ántes que estas sean puestas en los platos individuales.

Los dos platos están sin dibujos. El fondo plano está bién distinguido de la paréd la que se aumenta para arriba. El plato I. A. 401 está provisto de un borde bastante ancho, que tiene dos asideros. Compare la figura 53. b.

9. VASIJAS QUE SIRVEN PARA GUARDAR OBJETOS

En contraste con los demás indios, los Chiriguanos y Chaná usan vasijas para guardar cualquier cosa de valór. No recibí de los indios la indicación de

Nota 227. Nord. 2. Fig. 60 N. 26; Fig. 47 N. 22 y 23; Fig. 44 N. 19-21.
Nota 228. Nord. 1. p. 198.

que una de las vasijas, las que traje de ellos, pertenecieso especialmente a esta especie. Por eso refiero en ese lugar una vasija representada por dibujo por Nordenskiöld con la indicación «For keeping knicknacks in» (229).

Nordenskiöld dice en otro lugar, que por dentro de esas vasijas la dueña de la casa guarda todas las cosas de valor de la familia, como vestidos adornos, platos de plata, collares de turquesa o crysocol y muchas otras cosas más (230)

10. PLATOS PARA COMER, (ayá e), DE LA COLECCION

I. A. 388.	Chiriguano.	Altura	6,5 cm.	Abertura	21 cm. (Fig. 79. a.
I. A. 389.	»	»	8 cm.	»	22,5 cm.(Fig. 79. b.)
I. A. 390.	»	»	5,2 cm.	»	15 cm.
I. A. 391.	»	»	4 cm.	»	13 cm.
I. A. 406.	»	»	9 cm.	»	25 cm. (Fig. 78. a.)
I. A. 586.	Izcaó	»	13 cm.	»	25,5 cm.(Fig. 76. b.)
I. A. 591.	»	»	9,5 cm.	»	16,5 cm.
I. A. 594.	»	»	9,5 cm.	»	21 cm.
I. A. 595.	»	»	9 cm.	»	20 cm. (Fig. 80. a.)
I. A. 598.	»	»	13,2 cm.	»	25 cm.
I. A. 612.	»	»	9,5 cm.	»	19 cm.
I. A. 613.	»	»	8 cm.	»	21 cm. (Fig. 80. c.)
I. A. 614.	»	»	9 cm.	»	22 cm.
I. A. 615.	»	»	10,5 cm.	»	27,5 cm.
I. A. 616.	»	»	10,5 cm.	»	22 cm.
I. A. 618.	»	»	10 cm.	»	18,5 cm.
I. A. 620.	»	»	15,5 cm.	»	15 cm.

Porque todos los Chiriguanos y Chaqués, como ya mencioné, comen cada uno de su plato propio, tales platos de barro cocido se encuentran en gran número en las casas de esos indios. Muchos de ellos que están destinados al uso común, no tienen dibujos, mientras que otros usados en ocasiones de las fiestas, están provistos de dibujos en su superficie exterior o en el borde superior de su superficie interior o, provistos de añadidos pequeños.

Todos estos platos tienen un vientre redondo aumentándose un poco hacia arriba. Las diferencias de las formas existen casi solamente en las variaciones del borde superior y del fondo. La paréd de algunos de esos platos termina para arriba sin formar borde especial. Compare la figura 76. b. Otros platos están provistos de un borde en dirección horizontal o oblicua. El borde superior del plato I. A. 406 (Compare la figura 78. a.) está provisto de estalladuras chicas, continuas. El fondo plano de la mayór parte de los platos de los Izcaó es bien distinguido de la paréd, formando un pié. Esa distincion del fondo falta a la mayór parte de los platos de los Chiriguanos, de los cuales uno tiene un fondo casi redondo.

11. VASIJA USADA EN LA TÉCNICA DE HILAR, DE LA COLECCIÓN

I. A. 619. (Izcaó). Altura 5 cm. Abertura 12 cm. (Fig. 81. b.)

Nordenskiöld (231) representa por dibujos dos platos chicos de los Chaqués del Rio Parapiti, los que, según su indicación son usados en la técnica de hilar

como base para hacer voltear el kaso encima de su fondo. El plato chico I. A. 410, que yo recibí de los Izoseño y que se diferencia principalmente por su fondo, grueso y pesado, de los demás platos de la colección, asemejase, respecto a su forma y sus dimensiones a esos dos platos publicados por Nordenskiöld, así que yo lo tengo por un plato con el mismo destino, aunque no recibí de los indios alguna indicación respecto a eso.

12. URNAS FUNERARIAS

Ya en el capítulo relativo a tratamiento de enfermedades y al sepelio, me ocupé de la costumbre de los Chiriguanos de poner sus muertos dentro de urnas funerarias y de taparlas estas con otras vasijas. Según Nordenskiöld, (232) las vasijas grandes de barro cocido, usadas para preparar y guardar la chicha sirven también como urnas funerarias. Porque el sepelio en urnas funerarias no entre esos indios no sepelio directo, quiere decir que el cadaver entero se puesto dentro de la urna, las vasijas elegidas para urnas funerarias deben ser bastante grandes para poder dar cabida al cadaver de un adulto. Por desgracias yo no pude traer de Macharetí vasijas tan grandes. Las mayores de las vasijas traídas por mí, de una altura de 52 cm. y 62 cm. no eran bastante grandes como para poder dar cabida a un adulto y principalmente sus aberturas superiores, las que miden solamente hasta 24 cm. son demasiado pequeñas para poder apretar un difunto adentro. Por eso yo refiero respecto a las urnas funerarias y a las correspondientes tapas la representación por dibujo hecha por Nordenskiöld (233) Outes ha publicado una vasija de los Chiriguanos que tiene una altura de 27.5 cm. y una abertura superior de 45 cm. que había servido como urna funeraria para un niño pequeño. Junto con la urna se encontró un plato chico de barro cocido que tenía una altura de más o menos 6 cm. (234)

De los datos de Outes resulta que, las vasijas de los Chiriguanos pueden alcanzar dimenciones bastante grandes. (235) Entre las vasijas descritas por él se encuentra una que tiene una altura de 92 cm. y una abertura superior de 70 cm. de diámetro. Una otra tiene una altura de 110 cm. y su diámetro máximo mide 85 cm. Wedell halló en el año 1845 tales vasijas en Capirendá, que tenían una altura de 130 cm. y un diámetro máximo de la pared del vientre de 100 cm.

13. DIVERSAS VASIJAS SIN INDICACIONES RESPECTO A SU DESTINO DE LA COLECCIÓN

I. A. 410. (Chiriguano). Altura 14,5 cm. Diám. máx 8 cm. Abertura 5 cm. (Fig. 81. b).
I. A. 411. (») Altura 13,5 cm. Largór 21 cm. (Fig. 81. a.)
I. A. 397. (Izoseño) » 10,5 cm. Diám. máx 16.7 cm. Abertura 15 cm. (Fig. 79).
I. A. 399. (») » 9 cm. » » 13 cm. » 10 cm. (Fig. 70. a).

Respecto al destino de estas cuatro vasijas, diferentes en su forma de los demás tipos de vasijas, no tenemos indicaciones. La vasija chica, doble, I. A. 411 (Compare la figura 81. a.) tenemos que considerarla como un producto particular de la mescla de los varios elementos de cultura, más diferentes. La manera de como los dos platos chicos están unidos para formar una vasija do-

Nota 232. Nord. l. p. 228.

Nota 234. Felix F. Outes. l. c. p. 126 y Fig. 80 y 81.
Nota 235. Felix F. Outes. l. c. p. 127 y 128.

bio corresponde a modelos peruanos antiguos, mientras que la forma del agarradero proviene de un asilla en sitio dudo pétamente de origen europeo. El todo tiene la forma de un sabre y es fabricado tal vez con «ese destino para vendirlo a los blancos. Por mercadería, debieron tener también la vasija I. A. 616 (Compare la figura 61, b.) mientras que las dos vasijas I. A. 897 y 899 parecen ser fabricadas para cualquier destino en las Antillas.

TORTERAS DE HONOS, DE BARRO COCIDO.

Las tarteras de los honos relacionados entre los Chiriguanos é Isoseño son de barro cocido o de madera y, los Chiriguanos tienen también algunos honos con tarteras de piedra. Porque me ocuparé de las tarteras de honos en el capítulo relativo al bilado, quiero acentuar aquí solamente una diferencia respecto de su fabricación, entre las tarteras de barro cocido de los Isoseño y las de los Chiriguanos. Las tarteras de estos están hechas de pedazos de barro cocido procedentes de cualquier vasija rota, afilándolas redondas y perforándolas en el centro mientras que esas tarteras de los Isoseño consisten en un chico disco con diferentes variaciones de forma, también perforado en el centro para fabricado en barro cocido especialmente para ese destino.

Sobre la técnica de la cerámica de los Chiriguanos y Chaná existen bien instruidos por las indicaciones hechas por Nordenskiöld, por S. Lizzé, por Métraux (236) y Campana. (237)

Entre estas es notable especialmente la descripción de la fabricación de las vasijas de barro cocido de los Chaná en el Río Ibiyuna, la que Nordenskiöld observó en todo el transcurso. En el libro escrito por Lizzé y titulado: «The technique of south american ceramics» hallamos, fuera del acuerdo sistemático de las observaciones hechas por Nordenskiöld entre los Chiriguanos y Chaná, datos importantes sobre los resultados de los análisis químicos y las observaciones microscópicas, las que Lizzé hizo respecto a las vasijas de esos indios. Según estas indicaciones, el curso de la fabricación de esas vasijas es el siguiente:

La primera condición para la fabricación de vasijas de barro cocido es el disponer de un barro propio que tiene bastante plasticidad para poder modelar la vasija y quemarla sin que ella se rompa. Solamente un barro provisto de cualidades especiales puede cumplir esas dos requisitos. Generalmente se necesita corregir los defectos del barro disponible, arreglándolo por añadidura de otras substancias. Así los Chiriguanos y Chaná añaden al barro, pedazos de barro cocido, triturados. Las mujeres Chiriguanas en Tarapaya, utilizaron con predilección como tal añadidura, que ellos llaman «takupe», los pedazos de barro cocido, antiguos, los que se encuentran en gran número en su terreno y cuya substancia contiene, según la investigación microscópica, igualmente pedazos de barro cocido, añadidos al barro. (238).

De la calidad de la substancia de una vasija de barro cocido de los Chaná del Paraguay la que está en el museo de Göteborg, resulta que estos indios añaden al barro fuera de pedazos de barro cocido, triturados, también arena. (239) Por análisis microscópico de cortes de vasijas, Lizzé pudo demos-

Nota 239. S. Lizzé. l. c. p. 34.

trar que al barro de los Chiriguanos fueron añadidos pedazos de barro cocido. Como resultado de estos analisis él indica lo siguiente: «Microscopic section analysis of Chiguano-ceramics have shown the materials, to contain, biside small quartz grains and larger grains of other minerals, particles of the same colour as the ground - mass, but with distinct outlines. These ar due to ground? potsherds. There are also some very dark particles, as well as lighter ones, and they, too, are potsherds. The variation as to colour is due to the vessels often, in the firing, becoming quite differenthy coloured in their outes and inner layers». (240)

Según las observaciones de Nordenskiöld entre los Chanés en Itiyuru el barro destinado a la fabricación de una vasija fué primero triturado y después mesclado con los pedazos de barro cocido, también triturados. No conocemos de que manera el barro asi aprestado es transmutado por añadidura de agua en la substancia plastica que se necesita. La construción de la vasija se hace a la manera más común entre los indios Sudamericanos. Primero se forma del barro preparado a la manera descrita, un disco con borde levantado y se le pone encima de un pedazo de genero o de una tabla. Sobre esta parte que forma la base de la vasija se construye la paréd por medio de rodillos de barro que son puestos, en forma de anillo, uno encima del otro. (241) A bruñir la superficie de la vasija construida de manera descrita, sirven piedras y palitos estrechos de caña. Estas se usan también como medida para lograr las justas proporciones. Para refregar la superficie de las vasijas destinadas a cocer y de las vasijas mayores es usado comunmente un marlo de maiz que hace lineas hundidas, paralelas de manera que la superficie de esas vasijas está menos lisa. (242)

A la manera descrita en lo que precede, los Chiiriguanos logran fabricar vasijas exquisitas solidas, que muestran una forma bién proporcionada de la paréd. Según mediciones, hechas por Linné, la diferencia radial de la abertura de las vasijas de los Chiriguanos cuyas aberturas superiores tienen un diámetro de 15 hasta 20 cm. es inferior a 1 mm. (243)

Datos sobre el espesor de las vasijas de los Chiriguanos, Outes los dá en su publicación mencionada. Según él «las paredes de los vasos, en general, no acusan un gran espesór; en los de mayor tamaño, tienen 15 a 20 milimetros; en los medianos, no exceden de 8 milimetros; en las reducidas jarritas ventricosas, oscilan entre 7 y 4 milimetros. Como excepción de esos Outes menciona una vasija chica de una altura de más o menos 6 centimetros y un diámetro máximo de 12 centimetros, que es relativamente grosera, pues sus paredes laterales tienen de 9 a 7 milimetros y el fondo alcanza a 15 milimetros. (244)

Una grande parte de las vasijas están provistas, todavia antes de sufrir la cocción, de asas o de diferentes especies de adornos encima de su superficie. La superficie del cuello de las vasijas destinadas a cocer, está adornada con el ornamento hundido por impresiones hechas con el dedo. Sobre la superficie de algunas vasijas se colocan rodillos de barro, como muestra el pedazo de barro cocido de una vasija de los Chanés representado por dibujo por Linné (245) o, la superficie está munida de pequeños añadidos. Compare la vasija representada en la figura 44. Las vasijas más finas son pintadas antes de la cocción. Los dibujos son aplicados en blanco, colorado, marrón - oscuro y negro. (246) El tinte blanco representa en común el colór fundamentál encima del cual son aplica-

dos los demás tintes. A eso sirven pinceles chicos hechos de pelos de agutí o de plumas unidas por medio de cera. (247) El tinte blanco consiste de un tinte de tierra (Caolino), el colorado, el marrón oscuro y el negro en substancias minerales polverizadas del correspondiente colór. (248) Métraux ha publicado los resultados de analisis quimicos y observaciones petrograficos que hizo de estos colores minerales. (249)

Según Nordenskiöld, los Chiriguanos, a veces, pintan sus vasijas con tinte que consiste en una mescla de urucú y aceite, el cual es aplicado probablemente después de cocida la vasija (250)

Antes que la vasija sea cocida, debe estar bién seca. En el caso observado por Nordenskiöld entre los Chanés, en el Itiyuru, se hizo secar la vasija un dia en la sombra, lo que se puede hacer según una otra indicación de Nordenskiöld también al sol. (251) La cocción se hace según las observaciones de Nordenskiöld de modo que leña, marlos de maiz y excrementos secos de vaca son amontados al rededór de la vasija. Este combustible debe quemar con un fuego fuerte un cuarto de hora y siendo la vasija grande, todavia más tiempo. (252)

Algunas de las vasijas de los Chiriguanos están barnizadas. Según Nordenskiöld tales vasijas son frecuentes entre los Chiriguanos y Chanés en el Rio Itiyuru. Las untan con la resina de una Minosoidea, que los Chiriguanos llaman «taraviruti». Barnizadas de esa manera las vasijas reciben un lustre amarillento. Solamente las vasijas de los Chanés en el Itiyuru muestran a veces una pintura negra en su orilla, la que se hace con la resina de Palo santo (Bulnesia Sarmienti) la que es extendida sobre la superficie de la vasija después de estar ella cocida. (253)

EL LABRADO DE LA PIEDRA Y DE LOS METALES

La fabricación de utensilios de piedra no se efectua entre los Chiriguanos y Chanés. Lo mismo se puede decir respecto a la fabricación de utensilios de metál excepto que los Chiriguanos, a veces, hacen ellos mismos sus tembetás de estaño, (254) mientras que ellos procuran por lo común sus adornos y utensilios de metál de los mestizos y los blancos.

EL LABRADO DE LA MADERA

Ya en lo que precede fueron mencionados diversos objetos de los Chiriguanos, labrados en madera, como ser postes de casas, escaleras, platos, cucharas, pipas, arcos, puntas de flechas y también cúyas y calabazas. Entre otros objetos hechos en madera tenemos que mencionar todavia el mortero junto con la mano, diversos utensilios de tejer, palitos para hacer redes, grandes platos que sirven para guardar comidas, y flautas. Porque los Chiriguanos al labrar la madera hoy utilizan exclusivamente utensilios modernos recibidos de los blancos, no conservaron en nada su técnica indigena.

[P-56-H]

LA TRITURACION DE LAS MATERIAS PRIMAS

Para la trituración de las materias primas, principalmente para triturar el maiz, los Chiririguanos y Chanés usan grandes morteros de madera con largas manos de mortero. (255) Un tal mortero de madera está presentado en figura, 15 y un otro, por Nodenskiöld. (256) Molinos de piedra, esos indios no los usan aunque ese utensilio era empleado, fuera de las tribus del Chaco, por todas las tribus de las que los Chiriguanos tenian como vecinos, después de su inmigración al Oeste. Según Métraux se emplea un pequeño molino de piedra sololamente para triturar las semillas de una planta las que los Chiriguanos las usan como jabón, lavando sus cabellos. Un tal molino de piedra esta representado por dibujo por Métraux. (257)

Porque el mortero de madera es común hasta hoy entre los Kaingués, los que pertenecen también al grupo linguistico de los Guaranies y, también es mencionado de los Tupinanbás antiguos de la costa oriental del Brasil, podemos suponer que los Chiriguanos trajeron este bién de cultura de su pais natal.

Del hecho de que la mandioca no tiene importancia en la economia de esos indios, se explica que ellos no utilizan el ralladór de madera, cuya aplicación está difundida entre tantas otras tribus de indios de la Americana del Sud que cultivan esa raiz alimenticia.

HECHURA DE CUERDAS Y DE HILOS

De los hilos de los Chiriguanos y Chanés los que están hechos de lana o de algodón, son hilados por medio del huso, mientras que los que están hechos de caraguatá, son torcidos con la mano. Sobre la manera de como son torcidos esos hilos de caraguatá no tenemos indicaciones.

La dirección según la cual esos hilos están torcidos por esos indios es comunmente hacia la izquierda, mientras que las dos madejas de las cuales, generalmente, consta cada un hilo están torcidas por lo común hacia la derecha. Compare los dos esquemas representados en la figura 137. La cuerda bastante gruesa, de algodón, extendido al telar, representado en la figura 104, para tender la urdimbre, está torcida a la derecha, pero ella consiste de tres hilos particulares, torcidos a la izquierda, los que a su vez se forman cada uno de dos madejas torcidas a la derecha. Las cuerdas de los arcos para tirar flechas formadas solamente de una madeja de pellejo animal, están torcidas a la derecha. La regla es, que todos los hilos, sean hilos de caraguatá hechos con la mano, sean hilos de lana o de algodón, hechos con el huso, están torcidos hacia la izquierda, constituidos por dos madejas torcidas hacia la derecha. Investigando muchos hilos de los Chiriguanos e Izozós hallé solamente dos excepciones a esta regla. De los dos hilos, enrrollados, junto, a la canilla I. A. 413 y constituido cada uno por dos manejas, el uno está torcido hacia la derecha y el otro hacia la izquierda y los hilos gruesos de lana de la urdimbre de la hamaca trenzada, I. A. 448, estan torcidos hacia la derecha formados por dos madejas torcidas hacia la izquierda.

Los husos que recibí de los Chiriguanos e Izozés pertenecen a aquel tipo de husos, muy común entre los indios de la America del Sud, que Nordenskiöld llama «tipo Bakairi» en contraste con el «tipo Bororo», siendo fundado esa nomenclatura por la descripción primera de esos dos tipos de husos por Carl von den Steinen, los que encontró entre los Bakairis por un lado y entre los Bororós por otro lado. (258) En contraste con el «tipo Bororo» el huso del «tipo Bacairi» usandolo para hilar, está tenido en posición vértical y tiene un chico aumento a modo de un botón al extremo superior del palito. Hilando, el hilo listo se envuelve al rededor del pedazo superior del palito. La materia de las torteras de los Chiriguanos e Izozés consiste en barro cocido (de los Chiriguanos de pedazos de vasijas rotas de barro cocido, afilados) en madera o, pocas veces entre los Chiriguanos, en piedra.

De las medidas mencionadas en lo que precede, resulta que las torteras de los Chiriguanos tienen por lo común un diámetro bastante mayór que las torteras de los husos de los Izozés. El palito más largo de los husos de la colección (de los Izozés) mide 54,5 cm; el más corto (de los Chiriguanos) 25,5 cm.

Como ya mencioné, todos los palitos de los husos de los Chiriguanos e Izozés están provistos al extremo superior del palito de un aumento a modo de un botón. La mayor parte de los palitos de husos tienen además un aumento en la parte inferior, directamente por debajo del lugar donde está puesta la tortera, de modo que se evita el descender de la tortera del palito en la posición vértical del huso. Muchos husos tienen directamente por debajo de la tortera un envolvimiento con algodón o lana cruda para asegurar la tortera.

La forma de las torteras muestra muchas variaciones. Ya mencioné que las torteras de los Chiriguanos son por lo común bastante mayores que las de los Izozés. Ellas son también mucho más uniformes. Los dos lados de barro cocido de los Chiriguanos son simplemente planos y lisos, lo que ya resulta de su origen de pedazos de vasijas rotas de barro cocido a las cuales los Chiriguanos dan la forma de un disco, afiliándolos y a los cuales los perforan en el centro. La misma forma la muestran también las torteras de piedra de los Chiri-

Nota 258. Carl von den Steinen: Unter den Naturvölkern Zentral-Brasiliens. Berlin 1894. p. 238. y 439 R. vd. 2. p. 196. Otto Nordenskiöld. Zwirnen und Spinnen bei Indianern. Ostmerikan., Göteborg 1924.

guanos y la mayór parte de las torteras de madéra. Pero entre estas hay también algunas (Compare la figura 87) que se asemejan a las formas, más complicadas, de las torteras de los Ipurinás aunque se diferencian de estas por su mayór tamaño.

Entre las torteras de los Ipurinás se encuentran solamente dos que están, como las torteras de los Chiriguanos en los dos lados planos. Las demás torteras de los Ipurinás, no solo las de barro cocido sino que también las de madera, muestran grandes variaciones de sus formas, de las cuales muchas se asemejan a las formas de torteras de los Peruanos antiguos. Compare las figuras 89 y 90.

LA TÉCNICA DE TRENZAR.

En una leyenda, la que me contó un indio Parecsi en Mato-Grosso, se trata de la aparición de una época nueva. La generación joven de los Parecsis se queja a su abuelo de que ellos ya habían olvidado la fabricación del fondo de sus diferentes cestas, quiere decir el principio y así pues el rellenado de esos trabajos. Del mismo pueden quejarse los Chiriguanos a sus abuelos. También ellos han olvidado por consecuencia del nacer de una nueva época, quiere decir por consecuencia de la conexión con los blancos la mayór parte de los elementos de su arte de trenzar y, imitaciones de mercaderías europeas o de objetos trenzados de indios vecinos, menos cultivados que ellos, constituyen solamente una mala compensación.

De las cuatro especies principales en las que pueden ser clasificados, respecto a su técnica, todos objetos trenzados de los indios de la América del Sud y las que yo he llamado en mis correspondientes publicaciones (259) «Stufengeflechte, Doppelfadengeflechte, Rohrstabgeflechte y Geflechte in Spiralwulsttechnik» encuentranse entre los Chiriguanos y Chaná-Ipurinás solamente las dos primeras. Sorprendente es el hecho de que no existe entre esos indios la cuarta especie (Geflechte in Spiralwulsttechnik) de objetos trenzados porque la técnica de esta era la más común en las regiones montañosas confinantes al territorio de los Chiriguanos.

Los objetos trenzados de la primera especie están hechos a la manera de que las tiras de un grupo son trenzadas con las tiras de un otro grupo que están verticales a las primeras, de la manera de que las tiras del primer grupo pasan alternativamente un cierto número de las tiras del segundo grupo y son pasadas por ellas; y en de modo que siempre las mallas que transcurren en la misma dirección, forman líneas de gradas. El número de las tiras cada vez pasadas por una tira del otro grupo, está generalmente de tres o de dos pero hay casos en los que es pasada cada vez, solamente una tira.

De objetos trenzados que pertenecen a esta primera especie, yo recibí de los Chiriguanos una grande estera para dormir, canastillos chatos, cribas, una cesta cuadrangular y un sombrero y, de los Ipurinás, canastillos chatos semejantes a las de los Chiriguanos y dos especies diferentes de cestas. Además usan los Chiriguanos y Chaná pocas veces también abanicos para soplar fuego (tapéko) trenzados de hojas de palmera (260). Métraux ha descrito y representado por dibujo un tal abanico para soplar el fuego. Este abanico está trenzado de las hojas de la palmera Caranday a la manera de los «Stufengeflechte», de modo que las tiras del primer grupo pasan alternativamente dos tiras del segundo grupo y son

La materia de los objetos trenzados los que ha mencionado en lo que precede, consiste en tiras de hojas de palmera o en tiras de caña y de la cesta I. A. 551, de los Chiriguanos en tiras de madera. Porque esos indios no disponen de palmeras con hojas pinadas ellos tienen que usar las hojas palmadas de la Carandaí, de donde se sigue la diferencia entre los objetos trenzados de esos indios y aquellos de otras tribus. Por ejemplo hacen los indios Guaraníes estores trenzados a la estera coleccionada entre los Chiriguanos, y costas almohadas a su tipo de cestos de los Ipurinas, de las grandes hojas pinadas de la palmera Acuri (Cocos Schizophylla Mart.). El lado o los lados de los cestos entre las hojuelas que forman el trenzado, forman el borde superior de la estera o de las cestas. Respecto a la palmera de Carandaí se necesita doblar las hojuelas del lado para ponerlas en la posición necesaria para poder trenzarlas las unas con las otras. Por tanto el borde superior está formado a la manera de un trenzado a la real las hojuelas están torcidas para poder seguir desde este rodamiento el trenzado. El borde inferior es también formado a la manera de un trenzado la que las extremas libres de las tiras y terminan en dos extremos, una en cada

Para Del. Mitteilungen. I. p. 460 y 461 y Plancha 69.

tula, que adornaban los bordes laterales de la estera. La estera está trenzada a la manera de que una tira pasa cada vez dos tiras del otro grupo. La ornamentación se formaba por «líneas rayas, paralelas al borde superior de la estera.

Las cestillas chaco de los Chiriguanos o Isoseña, en general, se asemejan respecto a su forma y a sus dimensiones. Ellas están trenzadas de tiras de caña y, a su borde exterior, provistas de un cerco de madera. Como la estera, trenzada, ellas son trenzadas a la manera de que siempre una tira de un grupo pasa dos tiras del otro grupo y muestran por ello en su superficie la misma ornamentación, que consiste en rayas paralelas y es típica para todos los objetos trenzados de esta manera. En esta ornamentación de las cestillas existe una diferencia en cuanto que, de algunas de ellas, la superficie entera está llenada de líneas paralelas que pasan todas en la misma dirección (Compare la figura 94c), mientras que la ornamentación de la mayor parte de estas cestillas consiste en «cuadrados concéntricos» (Compare las figuras 98. a y b.) formados por la combinación de cuatro mitades de la superficie de las cuales dos muestran las líneas paralelas en la dirección vertical a la de las líneas paralelas de los dos otras mitades. Respecto a los detalles de la formación de tales ornamentos por la técnica misma yo remito a mis relaciones publicadas. (102)

Las tres cribas las que recibí de los Chiriguanos corresponden respecto a su forma exterior y el redondeado del trenzar a las cestillas descritas en lo que precede. Ellas se diferencian de estas solamente en de que una tira tiene una cierta distancia una de la otra y de que una tira de un grupo pasa siempre sólo una tira del otro grupo, lo que no es producido aquella ornamentación de la superficie considerada en «rayas paralelas» que muestran las cestillas. También estas cribas están provistas de asas como las cestillas de los Chiriguanos. Un dibujo de una criba de los Chanés representado por Nordenskiöld, muestra que también «los Indios usan tales cribas. (103) Cestillas y cribas análogas a las mencionadas, Métraux las describe y representa por dibujos. (104)

La técnica del sombrero de los Chiriguanos (I. A. 504.) no es primordial, más, sin duda, recibida de los blancos y tal vez ha sido directamente enseñada a los Indios en las misiones. Para mostrar la técnica de este sombrero no tiene interés aquí porque ella es aplicada por los Isoseña también a la fabricación de un tipo de cestos de las cuales la figura 99. b. representa un ejemplar. La fabricación del sombrero principia en el centro y las tiras de las cestas está trenzado el principio son «enseñadas» por «alrededor» de otras tiras. Compare la figura 99. Lá manera de trenzar es como la de todos los otros objetos de esta especie, de los Chiriguanos y Chanés, de modo que una tira de un grupo pasa siempre dos tiras del otro grupo.

La técnica de la balsa chica, I. A. 512, que está provista de una tapa y correspondía respecto a su forma a una cigarrera moderna, no tiene interés para nosotros porque se trata de un producto de fabricación moderna.

Las cestas I. A. 501 (de los Chiriguanos) y I. A. 677 (de los Isoseña) tienen un interés especial, porque ellas representan el producto de una época vuelta en que ya se han olvidado los artículos primordiales de la técnica y por lo tanto se han perdido las formas típicas de las producciones de esas técnicas. La imitación de un tipo de cestas que tiene una grande propagación entre las tribus de Indios de la América del Sud principia con la hechura del fondo y termina en el borde superior de la cesta donde las estrenas libres de las tiras son sir-

(102) Vaca Schmidt: Schlingenmuster in Amerika-Ornamentik, Berlin 1906, p. 56 ss. y: Die nordamerikanischen Flechtmuster in der Ornamentik der Kriegerkultur Südamerikas.

(104) Métraux: l. c. p. 457 ss. Planches 56 ss.

mados. Si comparamos la estructura del fondo de esas cestas de los Chiriguanos y Chanés con la estructura de las cestas correspondientes de otras tribus de indios Sudamericanos como con la estructura de las cestas de los Bacairis en las afluencias del Rio Xingú (Matto-Grosso-Brasil) o de las tribus en el Rio Negro, llama la atención la grande diferencia respecto a la conformidad del trabajo. En mis publicaciones ya mencionadas (265) yo he descrito esta especie de cestas más minuciosamente y he mostrado que el ornamento especial que aparece en dos variaciones en el fondo de la mayor parte de las cestas de esta eepecie, todavia no degeneradas, está coherente con la técnica, porque solamente un fondo ornamentado de esta manera puede ser un principio propio para poder formar las paredes de la cesta. Además, hay la dificultad de que para la fabricación de las cuatro paredes de una de estas cestas se necesitan dos veces más tiras de lo que integra el número de los extremos libres de las tiras que salen del cuadrado o rectángulo trenzado que forma el fondo de la cesta. Por eso, los indios que saben todavia trenzar exactamente estas cestas, trenzan en el principio un pedazo rectangular, plano, dos veces mayor que el fondo proyectado de la cesta. Entonces los cuatro cantos de este rectángulo son doblados hacia arriba sirviendo de este modo como partes de las paredes de la cesta las que son completadas trenzando los extremos libres de las tiras las unas con las otras. Por este artificio se alcanza a disponer de un número suficiente como para poder formar las paredes de la cesta. Los Chiriguanos y Chanés de hoy desconocen este artificio y por eso ellos no logran hacer cestas exactas de esa especie. No sabemos si ellos, influenciados por industrias importadas o por ideas nuevas hayan olvidado poco a poco los artificios de su técnica primordial de trenzar o, si ellos hayan imitado formas de cestas las que habian visto entre otras tribus de indios sin que conocer los artificios de la técnica.

Completamente diferente de los fondos de las dos cestas, descritas en lo que precede, están formados los fondos y asi los rudimentos de las dos cestas I. A. 678 y 725. a, representadas en las figuras 86. a. y 98. b. En la fabicación de estas cestas los indios se han aprovechado de la experiencia que habian hecho en la fabricación del sombrero moderno descrito en lo que precede. El principio del trenzar de esas dos cestas en el centro del fondo corresponde exactamente al principio de la fabricación del sombrero, fuera de que las tiras de las cestas consistiendo en las hojuelas de la caranday son más anchas y por eso las mallas son mucho más grandes. Donde principian las paredes laterales de la cesta y se necesitan más tiras que para el fondo, son añadidas otras tiras, pero en contraste a la fabricación del sombrero por medio de una especie de trenza que une los extremos libres de las tiras primordiales con las tiras añadidas asi que todas juntos sirven para trenzar las paredes de la cesta. También las cestas análogas de los Chirignanos del valle de Caipipendi descritas y representadas por dibujos por Métraux parecen estar influenciadas bastante por la técnica moderna. (266)

Un tipo completamente diferente de las cestas descritas en lo que precede, representan las cestas I. A. 679 - 686, de los Izozós. El trenzar de ellas no principia en el fondo como el trenzar de las otras cestas, pero si en el borde superior y termina con la hechura del fondo. Yo he descrito minuciosamente este tipo de cestas que aparece entre muchas otras tribus de indios de la America del Sud, en tratando las cestas correspondientes de los indios Guatós y remito aqui mis relativas indicaciones y dibujos esquemáticos hechos para explicar la fabricación de esa especie de cestas. (267)

Porque los Guatós usan las hojas pinadas de la palmera Acuri como ma-

Nota 265. Max Schmidt: Indianerstudien l. c. y: Die technischen Voraussetzungen. l. c. p. 157 y 158.
Nota 266. Métraux. l. p. 454 - 457. Planches 58 - 61.
Nota 267. Max Schmidt: Indianerstudien in Zentralbrasilien. l. c. p. 221 - 227.

terial para esas cestas, ellos pueden dejar las hojuelas las que necesitan para trenzar la cesta, junto al limbo, él que forma así el borde superior de la cesta. Los Izozós, no disponiendo de hojas de palmera, pinadas, tienen que usar las hojas pentadas de la Caranday. De estas tienen que soltar las hojuelas para poder servir ellas a la fabricación de cestas. Por eso estas cestas principian al borde superior con una especie de trenza, que une las hojuelas sueltas para poder trenzar las paredes de la cesta. Como muestran las figuras 96 y 97 esta trenza principia y termina con un nudo. Estos dos nudos se encuentran al costado de la cesta o al medio de la paréd y están ligados de las más de las veces por un envolvimiento de hilo para evitar una interrupción del borde en ese lugar. Las tiras, saliendo de la trenza, son trenzadas las unas con las otras a la manera de que resulta la forma de una manga cuya abertura, por abajo, es cerrada por una trenza doble, cuyos dos extremos a los dos lados de la cesta, pasan por la paréd y salen otra vez para fuera de la paréd, terminando cada uno con un nudo. Los extremos de las trenzas del fondo de la cesta I. A. 683 (Compare la figura 97) forman a la vez el asa de la cesta. Las asas de otras cestas de esta especie consisten en un hilo o de una tira de cuero.

Trenzas iguales o semejantes a aquellas que forman a veces las asas de las cestas descritas en lo que precede, son usadas por los Chiriguanos é Izozós también en otros casos, como algunas veces en las franjas de las fajas y sobre todo para formar la parte mediana de las vendas para los cabellos de las mujeres anteriormente mencionadas. Conforme a la diferencia del numero de las madejas trenzadas y del numero de las tiras que cada vez son pasadas por una tira de la trenza resultan variaciones de esas trenzas como las representan las figuras 139 - 141. Cuanto mayór es el numero de las madejas de la trenza, tanto más la forma de una cuerda de la trenza se transforma en el aspecto de una venda. Compare la figura 32. a y b.

A la segunda de las cuatro especies de objetos trenzados, en que se clacifican todos los objetos trenzados de los indios Sudamericanos, pertenecen aquellos que están trenzados de modo que una fila de palos, de hilos o de semejantes cosas son unidos a la manera de que un hilo doble pasa continuamente o con ciertas distancias, la fila y, eso de modo que los dos hilos particulares del hilo doble, abrazan en cada rotación uno o más de los palitos o hilos de la fila.

De objetos trenzados con esta técnica existen en la coleción dos hamacas de los Chiriguanos y una cubierta de silla de caballo, de los Izozós.

OBJETOS TRENZADOS CON HILO DOBLE, DE LA COLECCIÓN.

I. A. 448. Hamaca. (Chiriguano) De lana. Largor 2,60 m. Anchura 0,75 m. (Fig. 102. b. y 109.)
I. A. 449. » » » » 2,05 m. » 0,60 m. Fig. 110.)
I. A. 844. Cubierta de silla de caballo (Izozó) 1,21 m. » 0,57 m. Fig. 103. b. y 129.)

Los hilos de las hamacas mencionadas en lo que precede están hechos de lana y eso no solo respecto a los hilos de la urdimbre sino que también respecto a los hilos dobles. La fabricación de esas hamacas se halla explicada por los dos dibujos esquemáticos representados en las figuras 109 y 110. El esquema representado en la figura 109, muestra el lugar de la hamaca I. A. 448 en que el hilo doble principia a pasar la fila de los hilos de la urdimbre. El arreglo de los hilos de la urdimbre se puede explicar solamente a la manera de que se ha hecho primeramente una urdimbre de un hilo continuo y en forma de una manga,

como se hace la urdimbre de los tejidos hechos con el telár. Los hilos dobles pasando los hilos de la urdimbre, abrazan con cada lazo originado por su rotación, un hilo del lado anterior de la urdimbre y un hilo del lado posterior de la urdimbre. Solamente al borde lateral son abrazados, como muestra la figura 109, tres o cuatro hilos por cada lazo. El hilo doble, que principia al lado derecho del esquema, transcorre toda la anchura de la urdimbre de la manera indicada por el esquema. Llegando al otro lado, el hilo doble no vuelve para pasar la urdimbre en la dirección encontrada, mas sus extremos son afirmados y, en ciertas distancias, pasan otros hilos dobles la urdimbre, á la misma manera como el primero. La hamaca I. A. 449 muestra el mismo arreglo de los hilos y de la urdimbre y el hilo doble pasa la urdimbre a la misma manera, fuera de que también al borde lateral son abrazados por él solamente dos hilos de la urdimbre y eso también un hilo del lado anterior de la urdimbre y un hilo del lado posterior de esta. Compare el esquema representado en la figura 110.

La cubierta de la silla de caballo, de los Izozós, mencionada en lo que precede, muestra una particularidad en cuanto a que los hilos dobles están apretados uno al lado del otro, de modo que forman un genero compacto cuyos hilos de la urdimbre desaparecen debajo de los hilos dobles. También de esta cubierta de silla de caballo están abrazados dos hilos de la urdimbre por cada un lazo del hilo doble y, solamente a los dos lados algunos hilos más. Pero una diferencia de las hamacas trenzadas con hilo doble consiste en que el hilo doble después de haber pasado los hilos de la urdimbre de un lado al otro lado, vuelve en la dirección encontrada pasando los hilos de la urdimbre. Una otra particularidad consiste en que cada una de las filas consecutivas de las mallas del hilo doble muestra cada vez la dirección encontrada de la otra, por lo que aparece una especie de ornamentación encima de la superficie, consistiendo en rayas. Como muestra el esquema representado en la figura 111, esta particularidad es producida por la manera especial de que son abrazados los hilos exteriores de la urdimbre por el hilo doble.

AROS DE MADERA PARA GUARDAR BIENES, DE LA COLECCION

I. A. 580.	Un par de aros.	(Chiriguano)	Diámetro	53 cm.	
I. A. 581.	»	»	»	»	51 cm.
I. A. 582.	»	»	»	»	46 cm.
I. A. 583.	»	»	»	»	43 cm. (Fig. 41.)
I. A. 584.	Un aro		»	»	48 cm.

En las casas de los Chiriguanos en Machareti hallé suspendidos aros de madera, los que, comunmente dos a dos, servian para guardar diversos bienes de los indios. La superficie circular de los aros está llenada por tiras de caña que están extendidas entre el aro y trenzadas unas con las otras como la muestra la figura 41. Los aros están provistos de cordones o tiras de cuero para poder suspenderlos en las casas. (268).

OBJETOS TRENZADOS, MODERNOS, DE LA COLECCION

I. A. 550.	»	»	»	27 cm.	»	13 cm.
I. A. 552.	»	»	»	31 cm.	»	23 cm.
I. A. 553.	Canasta chata			56 cm.	»	16 cm.

Nota 268. Compare Métraux I. p. 471. fig. 126 y 127.

De los Chiriguanos recibí algunas cestas, cuya técnica se diferencia completamente de la técnica de las cestas descritas en lo que precede. Ellos corresponden tanto a las cestas comunmente usadas por los Paraguayos que tenemos que tenerlas por artículos de una industria absolutamente moderna y no precisamos tratar su técnica. Nordenskiöld y Métraux representan, por dibujos y describen tales cestas de los Chiriguanos entre los cuales están algunas provistas de asas y otras de tapas. (269).

LA TECNICA DE TEJER

En ocasión de la publicación de un telár de los Parexi-Kabichis (270) he llamado la atención a la grande semejanza de todos los telares conocidos desde ahora de las tribus Aruacas. El telár que recibí de los Izozós corresponde, respecto a su forma y a su construcción, al telár de los Parexi-Kabichis, descrito y representado por dibujo por mi, mas contiene, sin contar con algunas discordancias insignificantes, un perfeccionamiento lo que Nodenskiöld ya menciona. (271).

TELAR Y OTROS UTENSILIOS PARA TEJER, DE LA COLECCION

I. A. 500. Punzón de madera, para arreglar los hilos de la urdimbre. (Chiriguano.) Largór 20,5 cm. (Fig. 91. a.)

I. A. 513. Canilla. (Chiriguano) Largór 25 cm. (Fig. 91. f.)

I. A. 741. Telár. (Izozó). Altura 1,19 m Largór del poste horizontal superior 56 cm. Largór del poste horizontal inferior 57 cm. Altura de la urdimbre 83 cm. Anchura de la urdimbre 25 cm. Largór de la lanzadera 28 cm. Largór de las dos espadas para tejer 44,5 y 41,5 cm. (Fig. 104.)

I. A. 728. » » » 27 cm. (Fig. 91 e.)
I. A. 671. Espada para tejer » » 38 cm.
I. A. 672. » » » » 45 cm.
I. A. 673. » » » » 30 cm. (Fig. 91 c.)
I. A. 674. Punzón para arreglar los hilos de la urdimbre. (Izozó) Largór 30 cm. (Fig. 91 b.)

I. A. 742. Espada para tejer. (Izozó). Largór 123 cm.
I. A. 743. » » » » 128 cm.

Antes de describir el telár de los Izozós, mencionado en la lista precedente y representado en figura 104, tenemos que acentuar que se trata en ese caso de un ejemplar muy pequeño. Por lo común los telares de los Izozós y Chiriguanos son bastante mayores, como ya muestran el largor y la anchura de sus tejidos. Pero yo tuve que contentarme con un ejemplar pequeño, por que la mayor parte de los telares mayores de los Izozós estaban armados en árboles, estando formado un poste vertical del telár por un tronco y, porque, en el principio de mi viaje, no pude llevar objetos demasiado grandes y difícilmente transportables. Un telár grande de los Chanés es representado por dibujo por Nordenskiöld. (272.)

Como muestra la figura 104 el cuadro del telár de los Izozós es formado por dos palos verticales y dos palos horizontales. Los palos verticales están pro-

Nota 269. Norp. 2. p. 171 y Fig. 58 y 61. Métraux I. p. 411-454. Planches 73-77.
Nota 270. Max Schmidt: Die Parexi-Kabichi. Ethnologische Ergebnisse der Expedition zu den Quellen des Jauru und Juruena in Jahre 1910. Baessler-Archiv. Bd. IV. Heft 4/5. 1914. p. 214 y 215.
Nota 271. Nord. 2. p. 174-176.
Nota 272. Nord. I. Abb. 129.

vistos en sus extremos superiores de horquetas y son fijados en la tierra a cierta distancia uno del otro. El palo horizontal, superior, está puesto en los dos horquetas de los palos verticales y el palo horizontal inferior asegurado a ellos, a poca distancia del suelo, por un envolvimiento.

De los telares de los Paressi-Kabichís la urdimbre es construida simplemente de la manera de que un hilo es arrollado continuamente al rededor de los dos palos horizontales. Por tanto, la urdimbre, lista, envuelve los dos postes, horizontales como un anillo cuya mitad está al lado anterior del telár y la otra mitad en la parte posterior. De la construcción de una urdimbre, formada de tal manera, resultan ciertas condiciones de la forma de los tejidos hechos con un tal telár. Si la urdimbre entera está utilizada, transformandose el anillo entero de los hilos de la urdimbre, por la trama, en un tejido, este tejido tiene necesariamente también la forma de un anillo ó de una manga como por ejemplo, los tipoys de las Paressi-Kabichís. Pero, cuando se quiere fabricar un tejido plano como, por ejemplo, una venda, se necesita dejar una parte de los hilos de la urdimbre libres y cortarlos en ese lugar. El tejido formado de esta manera tiene la desventaja de que hay que afirmar, de cualquier manera la trama en los dos extremos. De los telares de los Chanés-Izozós y de los Chirihuanos esta desventaja es evitada por un artificio ingenioso que es ilustrado por el esquema representado en la figura 105. La urdimbre de este telár no es formada a la manera de que el hilo, que la forma está arrollado simplemente al rededor de los dos palos horizontales del cuadro del telár. Como muestra la figura 105, un cordón está extendido entre los dos palos verticales en el lugar donde se quiere principiar con la trama. El hilo que forma la urdimbre pasa primeramente a este cordón extendido, pasa el palo horizontal inferior y entonces al palo horizontal, superior, pasa otra vez hasta el hilo extendido, enlazandole y volviendo al palo horizontal, superior y así por delante hasta que, después de haber enlazado todavía una vez el hilo extendido, él es afirmado en el tejido. También en ese caso la urdimbre lista forma un anillo y así pues los Chiriguanos y Chanés pueden fabricar con su telar, como los Paressi-Kabichís, tejidos en forma de una manga sin costura, de los cuales el tipoy, tan común entre sus mujeres, representa un ejemplo. Pero, como muestra también el esquema, ese anillo puede ser abierto a gusto sacando el hilo extendido, de modo que resulta un tejido plano cuyos cuatro bordes están afirmados por la manipulación de la misma operación de tejer. Del hecho de que los hilos de las franjas de las fajas, de los Chiriguaé Izozós, terminan como lazos, siguese de que también las fajas de estos indios han sido tejidas con un tal telár provisto del cordón extendido, el cual fué sacado posteriormente.

En lugar del palito que los Paressi-Kabichís hacen pasar entre los hilos pares é impares de la urdimbre para arreglar la «formación normal» de esta, á la manera de que los hilos pares están por abajo y los hilos impares por arriba ó, vice-versa, los teláres de los Izozós tienen un cordón torcido de fibras de caraguatá que pasa la urdimbre a la misma manera y está asegurado con sus dos extremos a los palos verticales del telár.

Para poder formar facilmente por una sola manipulación la segunda formación de los hilos de la urdimbre, en que los hilos pares, los que estaban en la formacion normal por abajo, son tirados para arriba, pasando los hilos impares, está construido el mecanismo representado por el esquema de la figura 106. Como esta figura lo muestra, este mecanismo consiste en lazos pequeños de hilo de algodón, los que abrazan los hilos pares de la urdimbre y son enlazados los unos con los otros. Del mecanismo correspondiente del telár de los Paressi-Kabichís, ese mecanismo de los Izozós se diferencia por eso de que no está previsto, como aquello de un palito que sirve para unir los mencionados lazos los unos a los otros.

Por tirar la urdimbre la posición de esta puede ser variada de modo que la parte de la urdimbre con que se trabaja está siempre en la altura propia y al lado anterior del telár. También se puede efectuar por trasladar el palo horizontal, inferior, del cuadro del telár, que los hilos de la urdimbre están siempre tirantes.

Para hacer pasar el hilo de la trama alternativamente las dos divisiones de los hilos de la urdimbre, formados por el cordón y los lazos mencionados en lo que precede, se habren estas divisiones por medio de una especie de espada de madera, de las cuales la colección tiene 5 ejemplares fuera de los dos que pertenecen al telár. Dos de estos miden más de un metro, pues, están destinados a la labor con telares mucho más grandes que aquél que está represen ado en figura 104. Ese utensillo sirve a la vez para fijar el hilo de la trama a la parte terminada del tejido después de haber pasado la urdimbre.

La lanzadera por medio de que se hace pasar el hilo de la trama las dos divisiones de los hilos de la urdimbre, alternativamente de la izquierda a la derecha y de la derecha a la izquierda, consiste en un simple palito en que está envuelto el hilo. En la lista de los objetos de la colección están mensionados dos ejemplares de tales lanzaderas de los Izozós fuera de él que pertenece al telár. Compare las figuras 91.d y e.

Fuera de estos utensilios, yo adquirí dos otros en forma de un punzón y hechos de madera, los que son usados para arreglar los hilos de la urdimbre. Uno de estos es de los Chiriguanos y el otro de los Izozós. Peines que eran usados por los Peruanos antiguos para este destino, los Chiriguanes y los Chanés no los usan.

Fuera de ese tipo usual de telár encuentranse entre los Chanés y Chiriguanos también otros tipos especiales, correspondientes a las formas de telares de los Peruanos antiguos, para tejer vendas. Del hecho de que el mecanismo de estos telares hace posible la formación de más divisiones de los hilos de la urdimbre resulta la posibilidad de más variaciones respecto a la ornamentación. Nordenskiöld representa por dibujo un tal telár de los Chiriguanos. (273) Sin duda, esta especie de telár es un producto de la influencia de la cultura de los Peruanos. antiguos.

Conforme al destino diferente, se puede hacer con el telár provisto de una urdimbre en forma de un anillo, descrito en lo que precede, tejidos muy diferentes, de los cuales la mayor parte ya fueron mencionados en el capítulo respectivo al vestido. Respecto a las medidas de esos tejidos remito al lector a mis indicaciones correspondientes. El material de todos esos tejidos consiste en hilos de algodón o de lana.

De los tres tipoys de la colección, recibidos de los Izozós, uno (I. A. 839) consiste en un tejido de forma de una manga hecho de la urdimbre en esta forma. El tipoy de lana (I. A. 832) ha sido alargado por coser dos de tales tejidos, uno al lado del otro. La estructura del tejido muestra claramente el hilo que fué extendido entre los dos palos verticales del telár antes de hacer la urdimbre y, que se quedó en el tejido. El tipoy I. A. 838 no es típico, consistiendo en un tejido plano, cuyos dos bordes enfrentados están cosidos el uno al otro.

Respecto a la fabricación de los ponchos tenemos que mencionar que los de los Chiriguanos consisten de dos tejidos cosidos uno al otro en la dirección de la hendidura del poncho, mientras que los ponchos de los Izozós, consisten, las más de las veces, en un solo tejido hecho con el telár en toda su anchura y, por eso, no muestra, en su parte mediana, una costura como la muestran los ponchos de los Chiriguanos. De los bordes firmes en la dirección de la trama se puede conocer claramente que fué utilizado el mecanismo especial de los Chiriguanos y Chané-Izozós, que consiste en el hilo extendido entre los dos palos verticales del telár. Después de terminar la labor de tejer, el hilo fué sacado del tejido para transformar este en un tejido plano.

La hendidura de los ponchos que están tejidos como enteros, no es hecha de modo que se corta posteriormente el tejido, ya terminado, pero si es formada en el mismo acto del tejer. Como muestra, el esquema, representado en la figura 113, la hendidura, está efectuada de modo que en la parte de la urdimbre en la que se hace la hendidura, el hilo de la trama no pasa la urdimbre entera, mas vuelve, cuando ha pasado la mitad de ella, para pasar la división siguiente de los hilos de la urdimbre en la dirección encontrada. De este método de tejer resulta que la hendidura, del poncho está provista de un borde firme. Tenemos que mencionar, todavía, la especialidad de los ponchos de los Chiriguanos y de los Izozós de que los cuatro cantos están doblados y costureados a la demás parte del tejido. Por eso los ponchos de esos indios muestran cantos redondos. Compare las figuras 117 y 118.

De las mantas de los Izozós, solamente una consiste de dos tejidos costreados el uno al otro. Algunas otras están transformadas posteriormente de ponchos, cerrandose sus hendiduras por una costura.

También las vendas para los cabellos de hombres muestran claramente que están tejidas con un telar como aquél que hemos descrito en lo que precede y que era provisto del hilo extendido entre los dos palos verticales del telár. Excepto solamente una de esas vendas (I. A. 669) las franjas de las demás de ellas terminan todas en lazos del hilo, de modo que no puede ser que la urdimbre, antes en forma de un anillo, fuese cortada posteriormente. Los lazos de los hilos libres en los dos extremos de esas vendas pueden estar afirmados de manera muy diferente como lo muestran los esquemas representados en las figuras 107-110.

La fabricación de las dos vendas para cabellos de hombres, tejidas de pelo humano y, correspondientes respecto a su forma a las fajas, es la misma como en la de las vendas de algodón, además de que los lazos de los hilos libres están afirmados de una manera más simple. Compare el esquema representado en la figura 111.

La fabricación de las fajas de lana o de algodón, corresponde a la de las vendas para los cabellos de hombres, tejidas de pelo humano. También la manera de afirmar los lazos de los hilos libres en los extremos de las fajas es en general la misma, como lo muestra la figura 111, excepto solamente en que las franjas consisten de más de uno de esos lazos, de modo que forman hilos torcidos más gruesos, los que terminan con cuadros.

De las dos cubiertas para silla de caballo, el uno (I. A. 842) está tejida a la manera como de las mantas, mientras que la otra, I. A. 843, muestra, respecto a su fabricación, la especialidad de que cada vez dos hilos de la trama pasan la misma división de los hilos de la urdimbre y, eso de modo que uno de esos dos hilos de la trama pasa la división de la izquierda a la derecha y el otro de la derecha a la izquierda. El esquema representado en la figura 126 muestra el curso de ese hilo doble de la trama y muestra también como por eso se efectúa hacer el borde del tejido más firme de lo que fuese si los dos hilos de la trama pasarían la división de los hilos de la urdimbre en la misma dirección.

El tejido del cual está fabricada la bolsa de los Chiriguanos I. A. 444 no está hecho de un tejido en forma de una manga, pero sí de un tejido plano en forma de una manta. Por costura de los dos cantos más estrechos fué hecho primeramente un tejido en forma de una manga del cual se hizo la bolsa costureando los bordes el uno a otro, dejando solamente una parte abierta para abertura.

Las bolsas dobles, mencionadas en lo que precede, están hechas de un tejido plano, sea de hilos de lana, sea de hilos de algodón, doblando sus dos extremos y costureando los bordes el uno al otro. El esquema representado en la figura 112 muestra el tejido plano antes de la costura de los bordes. Todos los bordes exteriores del tejido están afirmados por el proceso del tejer mismo, pues el tejido está hecho primeramente en forma de una manga y transformado en un tejido plano por sacar el hilo que fué extendido entre los dos palos verticales del telár. También los bordes, señalados en el esquema EF; GH; EI; GL; FK; y HM son afirmados por el proceso del tejer, lo que fué alcanzado por hacer pasar el hilo de la trama a las divisiones de la urdimbre solamente por partes de la manera como lo conocemos por la fabricación de la hendidura de los ponchos. Solamente en los lugares que están señalados en el esquema con JL y MK, los hilos de la urdimbre han sido cortados de modo que estos cantos del tejido, no son afirmados por el proceso del tejer mismo. Para taansformar el tejido, descrito en lo que precede, en la bolsa doble sus dos extremos son doblados en las partes marcadas en el esquema por las dos líneas punteadas, de modo que los puntos A; B; C; y D están puestos encima de los puntos A/; B/; C/ y D/. Entonces los bordes que están puestos uno encima del otro (OA/; QB/; PD/; y EC/)

son costureados uno a otro. Las partes EILG y FKMH son dobladas al revés para formar las tapas de la bolsa doble.

Correspondiente del mecanismo simple del telár con que los Chiriguanos y los Chané - Izozós fabrican sus tejidos, las posibilidades de producir variaciones de la ornamentación de estos, están muy limitadas. Las variaciones de la ornamentación de los tejidos de las tribus del Chaco, como, sobre todo de los Churupis la que consiste en meandros, zigzagues, rombos y muchas otras figuras, no las hallamos entre las ornamentaciones de los tejidos de los Chiriguanos y Chanés.

Porque hoy los tejidos de esos indios, sobre todo las fajas y los ponchos están tejidos muchas veces de hilos importados o si están tejidos con hilos de lana o de algodón, indígenas, éstos están muchas veces teñidos con tintes importados, los diferentes colores de los ornamentos en la superficie de esos tejidos no tienen importancia etnológica.

La ornamentación está formada exclusivamente por los hilos de la urdimbre debido a que la distancia entre los hilos de la urdimbre es mucho menór que la distancia entre los hilos de la trama, de modo que las mallas de la trama desaparecen completamente abajo de las mallas de los hilos de la urdimbre. Porque fuera de eso la formación de las divisiones de los hilos de la urdimbre, es efectuada por un solo mecanismo de lazos, ella puede consistir solamente en levantar y bajar alternativamente los hilos pares y los hilos impares de la urdimbre, por lo que la ornamentación no puede ser influenciada todavia por el proceso de la operación misma de tejer. La estructura de esa especie de tejidos es necesariamente tal, que en la dirección del hilo de la trama así pues vértical a la dirección de los hilos de la urdimbre, cada vez una hilera de las mallas formadas por los hilos impares de la urdimbre, alterna con una hilera de mallas formadas por los hilos pares de la urdimbre. Así, en las figuras 120-124, la primera, tercera, quinta, septima, novena y undécima hilera horizontal están formadas por las mallas de los hilos impares, de la urdimbre, 1; 3; 5; y así sucesivamente, mientras que la segunda, cuarta, sexta, octava y décima hilera horizontal se forman de las mallas de los hilos pares de la urdimbre, 2; 4; 6; y así sucesivamente. De eso resulta que todas esas hileras impares, en la dirección de la trama, son iguales una a la otra respecto a su estructura y a su colór, asimismo son iguales entres si todas las hileras pares, en la direción de la trama. Por tanto la ornamentación de esos tejidos puede consistir solamente en la repetición continua de la ornamentación fijada por las dos primeras hileras, en la direción de la trama.

De esas reflexiones resulta que la unica posibilidad de proveer esos tejidos de ornamentaciones diferentes consiste en la variacion del colór d los hilos de la urdimbre.

La ornamentación más simple, que se puede hacer de esta manera, consiste en simples rayas de dirección longitudinal, quiere decir en la dirección de los hilos de la urdimbre. El tejido, incompleto, al telár representado en la figura 104 y, la manta I. A. 818 están provistos de una tal ornamentación de simples rayas. La figura 120 muestra que estas rayas en la dirección longitudinal están producidas de modo que, en ciertas distancias, está cambiado el color de los hilos de la urdimbre. Además de estas rayas longitudinales y, en varias combinaciones junto con estas, aparecen como ornamentación de esos tejidos, rayas transversales. Compare las figuras 121-124. Estas están producidas de modo que, cada vez, alternan, entre los hilos de la urdimbre, dos hilos de diferentes colores. Por eso es efectuado que la hilera de mallas formadas por los hilos impares de la urdimbre se diferencian respecto a su color de la hilera de mallas formadas por los hilos pares de la urdimbre. Si un hilo solo de la urdimbre tiene un color di-

ferente del color de los hilos constantes, aparece punto en la ornamentación como los muestra la figura 121.

De las explicaciones que preceden resulta que toda ornamentación de esos tejidos de los Chiriguanos y Chané-Izozio está producida exclusivamente por el arreglo de los hilos, de la urdimbre, de diferentes colores. El proceso del tejer es absolutamente indiferente a la ornamentación fijada desde su principio por el arreglo de los hilos de la urdimbre.

TEJIDOS DE LA COLECCION, HECHOS CON UN TELAR ESPECIAL

I. A. 737. Bolsa. (Izozó) De lana. Altura 21 cm. Anchura 22 cm. (Fig. 116.)
I. A. 738. Venda. » » Largor 1,3 cm. » 3,7 cm. (Fig. 115.)

Por causa de las conexiones que los Chiriguanos y Chanés tenían, desde hace tiempo, con la cultura de los Peruanos antiguos, es sorprendente que la técnica de estos tan desarrollada, no hubiera influenciado más en la técnica de tejer de esos indios. Así es que los Chiriguanos, todavía hoy, hacen la mayor parte de sus tejidos con el telar típico de los Araucos y con urdimbre en forma de un anillo, que han recibido, sin duda, de los Chanés. Además de estos telares comunes, aquellas formas de telares que recibieron directa o indirectamente de la técnica de los Peruanos antiguos tienen poca importancia.

Los dos tejidos de los Izozio, mencionados en lo que precede y sobre todo, la bolsa I. A. 737, son tejidos, que corresponden exactamente a los tejidos, hasta hoy, producidos por los Quichua y también a los tejidos típicos del último tiempo del imperio de los Incas.

Para poder explicar el aparecer de tales tejidos entre los Chanés del Paraguay tenemos una indicación interesante de Nordenskiöld. Los indios comunicaron a ese autor que ellos habían aprendido esa técnica de tejer directamente de una mujer Quichua la que había inmigrado al terreno de ellos. (274).

El telár de los Chiriguanos destinado a tejer vendas y representado por dibujo por Nordenskiöld, muestra que también los Chiriguanos han aprendido tejer a la manera de los Peruanos antiguos. (275) En contraste con la manera de tejer descrita en lo que precede, esos tejidos están hechos a la manera de que el hilo de la trama pasa alternativamente los hilos del lado anterior de la urdimbre y los hilos de su lado posterior. Fuera de eso, un mecanismo doble para las divisiones de los hilos de la urdimbre hace posible mucho más variaciones de la ornamentación.

objetos son formados sin mecanismo especial para hacer las divisiones de los hilos de la urdimbre.

La figura 125 representa la estructura de la venda de la red I. A. 768. (Compare la figura 133.) El esquema muestra la manera de que están hechas esas vendas. Primeramente son extendidos los hilos longitudinales de manera semejante al modo de extender los hilos de la urdimbre de los tejidos comunes entre los dos palos horizontales del cuadro del telár, pero sin que fuese usado el hilo especial, extendido entre los dos palos verticales del telár. Entonces se hace pasar un hilo transversal que corresponde al hilo de la trama de los tejidos comunes, las dos hileras de los hilos longitudinales alternativamente de la derecha a la izquierda y de la izqnierda a la derecha de modo que este hilo se queda alternativamente bajo de un hilo de la hilera posterior de los hilos longitudinales y encima de un hilo de la hilera anterior. Pues la fabricación de esas vendas y de la hamaca I. A. 450 se diferencia de la de los tejidos comunes, principalmente por el hecho de que el hilo de la trama, pasa simultaneamente los hilos del lado anterior y del lado posterior de la urdimbre. Diversas irregularidades del curso de los hilos de la urdimbre muestran que los tejidos de esta especie han sido fabricados sin utilizar un mecanismo para formar las divisiones de los hilos de la urdimbre.

LA TECNICA DE HACER REDES

La técnica de hacer redes, tiene una grande propagación entre los Chiriguanos y Chanés y es empleada para fabricar diversos objetos, como redes de pescar, hamacas, redes para llevar cargas, bolsas y hondas. La materia que se usa para la fabricación de esas redes consiste en general en hilos hechos de fibras de caraguatá. En la colección existen dos redes para llevar cargas, de los Chiriguanos, hechas de hilos de lana y una otra hecha de tiras de piel de ganado vacuno.

La técnica común de fabricar sus redes es entre los Chiriguanos y Chanés la técnica llamada en alemán «Knotentechnik», empleandose» el nudo llamado en inglés reefknot. La figura 138. a y b muestra una tal «reefknot» y la figura 142 representa la técnica de hacer redes con este «reefknot». Según Nordenskiöld (275) los Chiriguanos y Chanés utilizan para hacer sus redes tablas rectangulares, chicas, iguales a aquellas que conocemos de muchas otras tribus de la América del Sud. Por desgracia, no adquiri una tal tabla de los Chiriguanos o de los Izozós. Por envolvimiento continuo de la primera tabla con un hilo se producen los lazos simples que están representados en el esquema (Figura 142) en la hilera superior. El hilo, después de haber alcanzado al otro extremo de la tabla se envuelve continuamente en la dirección encontrada al rededór de una segunda tabla enlazandose cada vez, con un nudo, con los lazos del hilo envuelto al rededór de la primera tabla. Si el hilo ha enlazado, de la manera descrita, hasta con el primer lazo de la primera hilera, la primera tabla puede ser sacada para servir entonces a la formación de la tercera hilera de las mallas de la red, la que es hecha a la manera igual como la segunda mas, en dirección encontrada. Es claro que las redes hechas con esa técnica en su forma más simple y sin complicaciones, deben tener una forma rectangular y, esta forma es típica para todas las redes de los Chiriguanos é Izozós, mientras que diversas otras tribus Sudamericanas, como por ejemplo los Bakairis, los que vivian antes en los afluentes del Rio Xingú (en Matto-Grosso), hacen redes triangulares.

I. A. 795-801, Redes para utensilios como I. A. 764 (Izozó) De caraguatá.
I. A. 508. Honda (Chiriguano). De caraguatá .Largor 15 cm.
I. A. 509. » » » » 14 cm.

Del gran tamaño de las mallas de las redes I. A. 360; 766 y 794 resulta que se trata de hamacas. Porque en el territorio de los Chiriguanos y Chanés no existen generalmente peces, sino pequeños, las redes para la pesca deben estar provistas de mallas bastante menores.

De las redes para llevar cargas, de los Chiriguanos, dos están hechas de lana y una de estas está provista de una venda como la mayór parte de esas redes de los Izozós.Las demás de estas redes, de los Chiriguanos y de los Izozós están hechas de hilos de caraguatá. Algunas de ellas tienen mallas bastante pequeñas pero entre las de los Izozós las con mallas grandes son la regla. Así también las mallas de las redes de los Izozós para transportar los grandes potes para agua, son muy grandes. La mayór parte de esas redes de los Izozós están provistas de una venda especial la que pasa por la frente del portador. La estructura de esas vendas que están hechas de hilos de caraguatá, de lana o de algodón, ya la hemos descrito en el capítulo respectivo de los tejidos. Compare la figura 133 y el esquema representado en la figura 125.

De los Izozós, la colección tiene dos bolsas de red las que están hechas de modo que la unidad de red, rectangular, es doblada en el medio y los cantos que están uno encima del otro son enlazados por el hilo en los dos lados longitudinales.

A la manera descrita en lo que precede, está hecha también la red del utensilio para pescar. I. A. 764. descrito en el capítulo respectivo a la pesca y representado en la figura 39. Porque ese utensilio se emplea para prender peces pequeños, la red tiene mallas muy pequeñas. También las hondas descritas entre los utensilios de la caza están hechas de la misma manera.

Nota 276 Donación del señor Teodoro Rojas.

RED PARA LLEVAR CARGAS, FORMADA CON LA TECNICA, LLAMADA EN ALEMAN «KNOTENCHNIK» PERO EMPLEANDOSE EL NUDO LLAMADO EN INGLES «SHEETKNOT», DE LA COLECCION.

I. A. 573. Red para llevar cargas. (Chiriguanos) De tiras de piel animal. Largor 0,85 m.

Esta red está hecha como las redes descritas en lo que precede, formada de nudos, pero el nudo empleado es el tipo, llamado en inglés «Sheetknot» y en alemán «Schotenstich». Este nudo está representado en la figura 138. c. y d. Según Nordenskiöld, (277) los Chiriguanos tienen también redes para pescar las que están hechas empleando esta especie de nudo.

REDES, DE LA COLECCION, FORMADAS CON LAZOS Y SIN USO DE NUDOS

I. A. 555-566. Red para llevar cargas. (Chiriguano). Largor 0,93 m.—1,80 m.)
I. A. 567. » » » » » Largor 1,15 m. (Fig. 134 y 143.
I A. 568. » » » » » » 1,20 m. (Fig. 144)

De los Chiriguanos recibí varias redes para llevar cargas, las que están hechas, sin que fuesen empleados nudos, por enlazarse el hilo en la forma que es ilustrada por las figuras 143 y 144 y que es común entre muchas tribus del Chaco, tal como sucede entre los Tapietés, Matakos, Tobas, Chorotes y Churupis.

El gran número de redes las que adquirí de los Izozós están formadas, sin excepción, de nudos, así que tenemos que suponer que esos indios no conocen o no usan la técnica de formar las redes con simples lazos y sin aplicar nudos y, que esta técnica, llamada en alemán «Schlingtechnik» es empleada solamente por los Chiriguanos o por una parte de estos. Nordenskiöld no menciona esta técnica de los Chiriguanos y en el cuadro sinoptico en que las diversas técnicas de formar redes son ilustradas, los Chiriguanos no son mencionados en la columna 5 entre las tribus de indios que usan la técnica de formar redes sin aplicar nudos. De las redes para llevar cargas, formadas de hilos de caraguatá, que adquirí de los Chiriguanos, 10 están hechas sin que fuesen aplicados nudos, en la técnica llamada «Schlingtechnik» y, solamente 7, aplicandose nudos con la técnica llamada «Knotentechnik». Por eso podemos suponer que, por lo menos, esta parte de los Chiriguanos usa la técnica de formar redes sin aplicar nudos aunque esta opinión está en contraste con la de Nordenskiöld que dice (278) que todas las redes fabricadas en esta técnica, halladas entre los Chiriguanos y Chanés, hayan sido adquiridas de los indios del Chaco:

BOLSAS DE RED FABRICADAS POR LOS TOBAS, DE LA COLECOION.

I. A. 572. Bolsa para llevar cargas. (Hallada entre los Chiriguanos) Lorgor 0,70 m.
I. A. 845. » » » » (Hallada entre los Izozós) Largor 57 cm.

Yo adquirí dos bolsas de red, una de los Izozós y la otra de los Chiriguanos, las que muestran diferencias de las técnicas mencionadas en lo que precede. Los Izozós y los Chiriguanos me dijeron que ellos mismos no hicieron esas bolsas y si las recibiesen de los Tobas.

Nota 277 Nod. 2. p. 164.
Nota 278 Nord. 2. p. 116.

COSTURA

Con la adquisición de vestidos europeos se generalizó naturalmente entre los Chiriguanos y Chanés la costura de estos vestidos para hacerlos y remendarlos. Agujas de coser, modernos, son hoy un artículo muy solicitado por ellos. Pero, sin duda, esos indios conocieron la técnica de la costura con empleo de una aguja con ojo, ya desde hace mucho tiempo por la conexión con la cultura de los Peruanos antiguos. Aunque los tejidos indígenas, las más de las veces, están hechos en un pedazo, son añadidas a la técnica indígena de estos tejidos muchas veces costuras provenientes de culturas ajenas. Mencioné que un tipoy grande de los Izozós consta de dos tipoys menores costureados uno al otro. Los ponchos de los Chiriguanos en Machareti constan de dos partes costureadas una a otra. Los cuatro cantos de los ponchos de los Chiriguanos e Izozós, las más de las veces, están doblados y costureados a la demás parte del tejido. En la fabricación de las bolsas para llevar cargas, especialmente de las doble-bolsas para cargar caballos o burros cargueros se emplean costuras.

Entre las cuyas que recibí de los Chiriguanos e Izozós hay varias que muestran desgarrones remendados por costura. Compare la figura 25. a. Los dos esquemas representados en la figura 130 a y b sirven para ilustrar la manera de hacer esa costura la que está formada, de las dos cuyas I. A. 666 y 667, de los Izozós, con hilo de algodón y, de una cuya de los Chiriguanos (I. A. 460.) con alambre fino. La cuya I. A. 667 muestra dos de esas reparaciones hechas con costuras.

EL LABRADO DE LAS PIELES Y EL CURTIDO DEL CUERO

Los Chiriguanos y Chanés conocen el arte del curtido del cuero y ellos utilizan para eso la corteza de la «Piptadenia» y de otros árboles. Sin duda, ellos recibieron el conocimiento de este oficio de los blancos. Emplean no solo cuero curtido sino que también tiras de piel animál para la fabricación de diversos objetos, (279) pero el oficio de trabajar cueros y pieles no tiene mucha importancia. Se dice que antes, los Chiriguanos, cuando cazaban, usaban un traje hecho de cuero y conforme a la hechura europea. (280) Fuera de eso no se usa el cuero para fabricar vestimentás sino para fabricar las sandalias. (281) La costumbre moderna de los hombres de usar un cinto de cuero tenemos que reducirla a la influencia de los blancos. Sin contar su aplicacion a la fabricación de los frenos y sillas de caballos o de asnos, de carga o de silla, sobre lo que no tenemos indicaciones, tiras cortadas de cuero o de piel animál son empleadas en forma de correas, principalmente para transportar o sospender cualquier objeto. Muchas veces, correas de cuero son colocadas a las redes para llevar cargas, a las hamacas y también a los aros para guardar objetos, mencionados en lo que precede, en lugar de los cordones comunes de fibras vegetales. La venda de la red para transportar cargas I. A. 564. de los Chiriguanos, consiste en una correa de piel de ganado vacuno, no curtida. Compare la figura 134. La vasija I. A. 617, de los Izozós, está provista de una correa de cuero asegurada en sus asas. Las cuerdas de los arcos para tirar flechas consisten de tiras de piel animál y, de tiras de la piel de ganado vacuno está fabricada la red I. A. 573, de los Chiriguanos.

ra guisar las comidas ya los hemos mencionado en los capítulos precedentes, como los potes para cocer las comidas y para hacer fermentar la chicha, los platos previstos de agujeros en el centro de su fondo para someter al vapor la harina de maíz, vasijas para fritar el maíz, los morteros de madera con sus manos y las cribas. No emplean los Chiriguanos y Chanés para fritar carne o pescados los estantes cuadrangulares o triangulares que son tan frecuentes entre muchos otros indios Sudamericanos, pero sí simples asadores de madera. (282) También no encuentrase entre estos indios, como ya dijimos, el rallo para rallar los raíces de la mandioca.

Tenemos que mencionar todavía dos otros utensilios usados por los Chiriguanos y Chanés para guisar sus comidas: el grande plato de madera y la espátula para remover las comidas y bebidas cuando están hirviendo o fermentando.

GRANDES PLATOS DE MADERA (FUENTES), DE LA COLECCION.

I. A. 574. (Chiriguano) Largor 0,83 m. Anchura 0,39 m. (Fig. 19.)
I. A. 575. » » 1, m. » 0,325 m.

Por desgracia no recibí datos sobre el destino especial de estos grandes platos de madera los que adquirí de los Chiriguanos en Machareti. Como muestra la figura 19 estos grandes platos de madera están previstos de los mismos asideros como los de los platos de madera, más pequeños, que sirven como vasijas para comer.

ESPÁTULAS PARA REMOVER LAS COMIDAS, QUE HAY EN LA COLECCION

I. A. 501. (Chiriguano) Largor 49.5 cm.
I. A. 502. » » 24.5 cm. (Fig. 21)
I. A. 576. » » 114 cm. (Fig. 20. b.)
I. A. 577 » » 93 cm.
I. A. 578. » » 62 cm. (Fig. 20. a.)
I. A. 579. » » 66.5 cm.

Estas espátulas de madera para remover son empleados por los Chiriguanos y Chanés para remover la gacha hervida de maíz cuando se la hace fermentar. Algunas de esas espátulas están provistas en sus mangos, de ornamentos semejantes a los de las espátulas correspondientes de los indios Guatós. Nordenskiöld representa por dibujo una tal espátula de los Chiriguanos prevista del ornamento en zigzag (283) y, al lado de él (284) una otra forma de esos utensilios, de los Chiriguanos, que consiste en el omóplato de un gran mamífero, asegurado a un mango de madera. (285)

FABRICACION DE BEBIDAS FERMENTADAS

Sobre la fabricación de la Chicha de maíz o sea la bebida nacional de los Chiriguanos, Nordenskiöld indica lo siguiente: (286) Primeramente el maíz es

Nota 282 Nord. 2 p. 55. Métraux I. p. 352 y figura 22.
Nota 283. Nord. 2. Fig. 17. A.
Nota 284. Nord. 2. Fig. 17 B.

Nota 286. Nord. 1. p. 297

triturado en grandes morteros, luego, cribabo y hervido en grandes potes con agua. Una parte de esa masa, sacada del pote, masticada y, bién mezclada con saliva, se une otra vez a la masa general. Esta, después de ser colada, fermenta en grandes potes abiertos, con calór moderado. Por medio de grandes espátulas de madera o de omóplatos de mamiferos provistos de mangos de madera, la masa es removida en el interior del pote. Una descripción más detallada de ese proceso la encontramos en la publicación de Métraux. (287)

LA CONSERVACION DE LOS VIVERES

Sobre el modo de conservar viveres conocemos que los Chiriguanos y Chanés secan pescados para el uso futuro, en los casos de pesca abundante. (288) Según Niño (289), antes también la carne de la caza era conservada para las grandes fiestas secandola al sol, sin emplear sal. Hoy todavía, cuando se mata un animál vacuno, una parte de la carne es conservada secandola al sol (290)

EL TRANSPORTE

Los Chiriguanos y Chanés, en contraste con los Itatines - Guarayis, no tienen embarcaciones. (291) Sobre los medios del transporte por tierra no tenemos indicaciones sinó las que resultan de los diversos utensilios que sirven para transportar cargas. Podemos suponer de la forma de sus doble-bolsas, mencionadas en el capitulo respectivo al tejer, que emplean sus caballos y burros para el transporte de cargas.

Los ojetos empleados para transportar cargas, ya estan mencionados, todos, en los capitulos que preceden. Entre ellos está el más generál la red para transportar, muchas veces provista de una venda. Por medio de ella son transportadas las cargas en largos viajes o son traidos los productos de la cosecha desde las plantaciones hasta las casas o el agua, muchas veces de lejos, hasta las habitaciones. La red para transportar se usa a la manera de que la venda pasa por la frente del portador de modo que la carga pesa encima de su espalda. (292) Por Nordenskiöld está publicada una fotografia de una mujér que está transportando una carga en su red. (293)

Canastos no son usados por los Chiriguanos y Chanés para transportar cargas, ellos sirven entre esos indios solamente para guardar objetos. Tampoco es empleada una venda especial para llevar criaturas; más bien estas son llevadas en un pliegue del tipoy.

Solamente si el agua está cerca de la casa las vasijas para agua, algunas veces, son transportadas sin red encima del hombro, pero, no encima de la cabeza. Esto aparece solamente en los casos de que los indios están influenciados directamente por los blancos como sucede en las misiones. (294)

Para transportar cantidades pequeñas de agua esos indios, cuando viajan, usan también calabazas enlazadas con un hilo, o vasijas chicas de barro cocido,

provistas de un hilo o de una correa de cuero, como por ejemplo, la vasija I. A. 617 representada en la figura 56. b.

Tenemos que recordar todavía que los Chiriguanos y Chanés transportan los peces a la misma manera como los tribus vecinas del Chaco lo hacen ensartandolos en un cordón provisto de una grande aguja de madera. (295)

UTENSILIOS PARA GUARDAR OBJETOS

También de los objetos que sirven para guardar cosas la mayór parte ya están mencionados en los capitulos que preceden, como las diversas especies de cestas y los arcos de madera los que están suspendidos en las casas para guardar diversas cosas dentro de ellos. La bolsa de red y la red para transportar no sirven solamente para transportar, sinó también para guardar cosas. Las vasijas de barro cocido no sirven solamente para guardar liquidos, pero se usan también para guardar muchas otras cosas que tienen un valór especial o son memorias antiguas de la familia. (296) Además, en las casas, están suspendidos ganchos especiales para sostener diversas cosas. Un tal gancho está representado por dibujo por Nordenskiöld (297) y, por Métraux un tal gancho, hecho de la pierna de un ciervo (298)

LA ARTE
FLAUTAS Y SILBATO DE LA COLECCIÓN

I. A. 491. Flauta «sororé (Chiriguano). De madera. Largor 17 cm. Anchura 2,7 cm. (Fig. 33. b.)
I. A. 492. » » » » Largor 20 cm. Anchura 3,5 cm. (Fig. 33. a.)
I. A. 493. Flauta. (Chiriguano) De caña. Largor 45 cm.
I. A. 494. » » » » 41 cm. (Fig. 34. a.)
I. A. 495. Silbato-doble. » » » 33,5 y 7 cm. (Fig 34. b.)

De los Chiriguanos en Macharetí adquirí dos diferentes especies de flautas, las unas hechas de caña y las otras hechas de madera. Las dos flautas hechas de madera I. A. 491 y 492 (Compare las figuras 93 a. y 93 b.) tienen importancia especial porque ellas se asemejan respecto a su forma y I. A. 491 también respecto a su ornamentación a una especie particular de astil de balanza de los Peruanos antiguos y, por eso ya fueron tratadas varias veces en la literatura etnológica. Estas dos flautas son sin duda, ejemplares bastante viejos que tal vez ya fueron usados por varias generaciones. Ellas son denominadas por los Chiriguanos «sororé» y consistes en una madera dura, perforada desde un extremo al otro. En el medio del canto superior de la losange del aparato hay dos pequeñas perforaciones. Una flauta análoga representada por dibujo por v. Rosen (299) muestra que esas perforaciones sirven para hacer pasar un cordón, para poder ponerse la flauta como adorno del pecho. Nordenskiöld (300) ya ha llamado la atención de la concordancia sorprendente que existe entre estas flautas y una forma especial de astiles de balanza de los Peruanos antiguos. Estos, de los cuales son conocidos numerosos ejemplares están caracterizados sin duda, como astiles de balanzas por el hecho de que de algunos ejemplares se conservó to-

Nota 295. Nord. 2. p. 46.

davia el cordón que pasa la perforación horizontal y que está provisto en su extremo de una pesa y en el otro extremo de un lazo o tal cosa parecida para recibir los objetos que hay que pesar. V. Rosen describiendo y representando por dibujo una de estas flautas de los Chiriguanos, que corresponde a la flauta I. A. 491, excepto solamente que de aquella flauta está conservada todavia el cordón que pasa los dos agujeros en el canto superior, defende contra las deducciones de Nordenskiöld la opinión de que también los objetos de esta forma de los Peruanos antiguos hubiesen sido primordialmente flautas y fuesen empleados solo excepcionalmente, en caso de necesidad o sea secundariamente, como astiles de balanzas. Entre los objetos de esta especie existen en la colección Peruana antigua del Museo en Berlin tantos ejemplares que muestran claramente que son astiles de balanzas por lo que no puedo declararme conforme con esta opinión de V. Rosen.(301) Tenemos que aprobar la opinión de V. Nordenskiöld de que esos objetos de madera, empleados por los Peruanos antiguos como astiles de balanza, fuesen aceptados por los Chiriguanos pero no como astiles de balanza, porque los Chiriguanos no tenian la necesidad de pesar cualquier cosa, pero si como flautas. Tenemos que mencionar que con esta especie de flautas, abiertas en sus dos extremos, se puedon producir dos diferentes sonidos según que se deja la abertura inferior abierta o se la cierra con el dedo.

Las dos flautas de los Chiriguanos, hechas de caña están provistas de 6 agujeros para variar el sonido y de un agujero, a un costado, para la boca. Compare la figura 39. a. Nordenskiöld que representa una tal flauta por dibujo (302) opina que los Chiriguanos y Chanés recibieron una especie de flauta de los mestizos o de los blancos, porque tales flautas provistas de un agujero a un costado para la boca no existen entre los demás indios Sudamericanos y tampoco entre los Peruanos antiguos.

El silbato doble I. A. 495 consiste en dos pedazos de caña unidos uno a otro a la manera de las flautas de Pan. En contraste con las flautas descritas en lo que precede, los dos tubos de esos silbatos están provistos de labios. Uno que tiene cuatro agujeros para hacer variar los sonidos, mide 33,5 cm, y el otro que no tiene tales agujeros solamente 7 cm. Un silbato de esta especie, pero no doble, está representado por dibujo por Nordenskiöld. (303)

Fuera de estos instrumentos de música son descritos por Nordenskiöld algunos otros, los que vió entre los Chiriguanos y Chanés. Entre ellos también encuéntranse aquellas flautas redondas, que son usadas por muchas tribus del Chaco y de las cuales una está representada por dibujo por Nordenskiöld. (304) Ellos tienen también grandes trompetas, las que los Chiriguanos llaman «angúahuasi», mientras que la trompeta común es llamada con la misma palabra para el mortero: angúa» o «angúarai». También encuentranse trompetas hechas de cuerno de ganado-vacuno o de una calabaza, las que son sopladas por el extremo superior. (305)

Según Nordenskiöld, las flautas de Pan que consisten en varias flautas unidas una a otra se encuentran pocas veces entre esos indios. (306)

El arte plástico está desenvuelto muy poco entre los Chiriguanos y Chanés. Plástica en forma animal la encontramos raras veces en las formas de las vasijas de barro cocido de los Chiriguanos. (307) Estas vasijas son, sin duda, imita-

ciones de modelos Peruanos antiguos o productos modernos. Fuera de eso están representadas por dibujos por Nordenskiöld dos muñecas en forma de un hombre y de una mujér, hechas de cera, las que servian como juguetes de las criaturas de los Chanés del Rio Parapiti. (308) Plástica solamente ornamentál la muestran principalmente la mayor parte de las vasijas de barro cocido destinadas a cocer comidas, en forma del «ornamento hundido», que es puesto generalmente encima de la superficie del cuello de estas vasijas, pero puede tambièn extenderse sobre la superficie entera. Compare la figura 48. La vasija I. A. 414, representada en la figura 44, está ornamentada fuera del ornamento hundido en el cuello por una hilera de añadidos chicos puntiagudos pasando al rededór de la paréd de la vasija, Linné representa por dibujo un pedazo de una vasija de barro cocido de los Chanés cuya superficie está ornamentada por un rodete de barro cocido puesto en zigzag encima de la paréd de la vasija. Añadidos chicos los tienen también muchas de las vasijas con superficie lisa y eso generalmente dos a dos. Ellos están muchas veces en lugar de asas. Tambien los platos de barro cocido para comer y los platos para fritar el maiz están provistos muchas veces de tales añadidos. Las asas de las vasijas de barro cocido no tienen la forma de figuras pero ellas pueden ser ornamentadas plasticamente de la manera de que un surco las divide en dos partes, las que pueden estar torcidas una al rededór de la otra. Compare las figuras 46 y 49.

También algunos utensilios de madera están provistos de una plástica ornamentál, primitiva, como las espàtulas para remover las comidas y bebidas, los platos de madera para comer y los grandes platos o fuentes para guardar comida. Los mangos de algunas de las espàtulas para remover las comidas son entallados de modo que sus bordes forman lineas en zigzag (Compare la figura I. A. 579.) y los platos están provistos muchas veces de dos añadidos como los muestran también algunos platos de barro cocido. Compare las figuras 18. a. y b. y 19.

Dibujos encuentranse encima de la superficie de objetos de los Chiriguanos y Chañéz, en forma de pinturas encimas de la superficie de las vasijas de barro cocido, en forma de gravados en la superficie de cuyas y calabazas o de flautas, de madera o de caña, y, en forma de ornamentos pirograbados encima de cuyas y también, pocas veces, en forma de tatuaje encima de partes del cuerpo humano. Sorprendente es la diferencia absoluta entre los dibujos aplicados a las superficies de las vasijas de barro cocido y a las de las cuyas y calabazas. Esta diferencia se explica por el hecho de que las ornamentaciones de las vasijas de barro cocido están hechas exclusivamente por las mujeres y las de las cuyas y calabazas por los hombres.

Los elementos fundamentales de la pintura hecha encima de la superficie de las vasijas de barro cocido, de estos indios, consisten en ornamentos geométricos completamente diferentes de los de los Peruanos antiguos é intactos de influencias europeas modernas. Sin duda se trata de productos de un arte antiguo é indigena. Pero no sabemos hasta qué punto este se origina de los Chiriguanos y hasta qué punto de los Chanés. Tampoco conocemos si las diferencias que existen entre el caracter de las pinturas de los Chiriguanos en Machareti y el de las pinturas de los Izozós del Parapiti sean solamente diferencias locales o estén fundadas en la diferencia de esas dos naciones. Pero, fuera de esa ornamentación primordiál y mesclada con ella, aparecen elementos ajenos de ornamentación que tenemos que reducir a modelos Peruanos antiguos asi sobre todo, las representaciones de plantas encima de la superficie de una vasija, de los Chiriguanos, las que muestran las figuras 64 y 145. Un

Nota 308 Nord. 1. Abb. 105.

ornamento, sin duda, también fitómorfo, que aparece repetidas veces encima de la superficie de las vasijas de barro cocido, como por ejemplo, de las vasijas representadas en las figuras 67 y 75. b, tiene su modelo directo en la forma de un ornamento que conocemos de las vasijas Peruanas antiguas de los últimos tiempos del imperio de los Incas. (309) Representaciones zoómorfas y antropómorfas encuentranse relativamente pocas veces entre los ornamentos de las vasijas de barro cocido. El cuadrúpedo representado en la superficie de la vasija I. A. 347, de los Chiriguanos, (Compare las figuras 65 y 147) y la manera de que está representado el camino abajo de este animál muestran muchas reminiscencias a representaciones correspondientes de los Peruanos antiguos. Las representaciones de animales y gente encima de la superficie de la vasijas I. A. 378 (Compare las figuas 63 y 146) la que es, respecto a su forma exterior, bastante moderna, corresponden a las de otros indios Sudamericanos. Como estos, también los Chiriguanos combinan elementos de la ornamentación geométrica para la representación de motivos zoómorfos o antropómorfos; así por ejemplo la linea graduada para la representación de gallos, y triangulos, para la representación del cuerpo de mujeres. Compare la figura 146.

Una diferencia principal entre la onamentación pintada encima de la superficie de las vasijas de barro cocido y la ornamentación grabada en la superficie de las cuyas, existe en eso de que la pintura de la vasija de barro cocido, se limita a la ornamentación de la parte superior de la superficie exterior o a la del borde superior de la superficie interior de la vasija; quiere decir a la ornamentacion de una lista continua, más ancha o más estrecha; mientras que los grabados en las cuyas ornamentan la superficie exterior entera, más o menos semiglobál, formando muchas veces el centro del semiglobo a la vez el centro de una ornamentación concéntrica.

Entre las cuyas ornamentadas que recibí de los Chiriguanos en Machareti se encuentran algunas que están provistas solamente de grabados y otras que tienen solo pirografias. Pero la mayór parte de ellas combinan estas dos maneras de producir una ornamentación. Varios ejemplares de esas cuyas ornamentadas, muestran los mismos motivos de ornamentación con sorprendente semejanza Sin contar con los motivos fitómorfos, estilizados, se encuentran entre los onamentos grabados, también figuras como la representación de un pequeño pez (compare la figura 148) y de una capilla, caracterizada claramente por una cruz. Compare la figura 153.

Entre los ornamentos grabados, tenemos que mencionar todavía las circunferencias concéntricas hechas encima de la superficie de la mayór parte de las torteras de los Izozós y de varias torteras de madera de los Chiriguanos y, la ornamentación de la flauta «serere» representada en la figura 33. b., la que corresponde, como también la forma de esa flauta, completamente a modelos Peruanos antiguos. También la superficie de la flauta de caña, I. A. 494, de los Chiriguanos, (Compare la figura 34. a.) muestra algunos grabados.

De los ornamentos tatuados uno está representado por dibujo por Nordenskiöld y lo halló aplicado al brazo de una mujér. (310)

EL ESTADO SOCIAL DE LOS CHIRIGUANOS Y CHANÉS

Respecto al estado social de lós Chiriguanos y Chané-Izozós, no puedo completar los pocos datos que conocemos sobre ese asunto porque las situaciones en las que me encontré con esos indios no eran propias a tales investigaciones.

Nota 309. Compare: Max Schmidt: Kunst und Kultur von Peru. 1. e. p. 38» Abb. 1.
Nota 310. Nord. 1. Abb. 108

Entre los Izozós, con los que me encontré en Toledo estaban algunos que fueron designados como caciques. A uno de estos que hablaba perfectamente español, yo debo el vocabulario que apunté de la lengua de los Izozós. A los Chiriguanos yo les conocí solamente en Manchereti, donde ellos vivieron mucho tiempo bajo la administración de Misioneros y, al tiempo de mi viaje, bajo la jefatura de uno de sus compañeros que tenía las funciones de un comisario. Dos otros indios Chiriguanos con quienes me encontré en Machareti fueron significados como caciques.

Para completar mis indicaciones sobre los Chiriguanos y Chané-Izozos tengo que resumir lo que conocemos de la literatura sobre el estado social de esos indios remitiendo a las indicaciones de Moreno, fundadas en los documentos antiguos y las de v. Nordenskiöld, basadas en sus propias investigaciones.

Naturalmente, muchas de las instituciones sociales, antiguas de los Chiriguanos y Chanés se han perdido después que aquellos perdieron su independencia de los blancos. También el poder de los caciques mayores disminuyóse considerablemente desde que ellos dependen de los blancos. Cuando Nordenskiöld hizo su expedición, no existia todavía un tal cacique mayór entre los Chanés en el Rio Parapití. El último cacique mayór había sido Aringui, cuyo sobrino, Batiraya era cacique; pero él habia recusado el oficio de un cacipue mayór porque no quiso estar demasiado dependiente de los blancos. (311)

Según las indicaciones de los documentos antiguos, los Chiriguanos después de su inmigración en la Cordillera, no formaban una comunidad uniforme, un estado, en sentido propio del derecho público. Antes si ellos formaban una federación de varias parcialidades. En la carta del Licenciado Cepeda, (312) del año 1585, se dice «que la Provincia de los Chiriguanos, que están en la cordillera en medio de Santa Cruz y la ciudad de La Plata los que están repartidos en tres parcialidades, distintas cada una de la otra, veinte y cinco leguas, aunque se comunican y se favorecen. Es la una la parcialidad de Vitupué y la otra de Condorillo y la otra Chiquiacá».

De las dos parcialidades de Vitupué y de Chiquiacá sabemos, que ellas, por lo menos primordialmete, cada una estaban bajo de la jefatura de un cacique mayór, de las que ellas recibieron sus respectivos nombres. Vitupuera era cacique mayór de aquella y Chiaca cacique mayór de esta. (313) Respecto a la parcialidad de Condorillo no tenemos indicaciones de si también esta parcialidad entera estuviese bajo la jefatura de un cacique mayór. Sabemos solamente que el pueblo Saigpuru era uno de los más importantes y el más temido por los enemigos y que sus habitautes fueron derratados el año de 1779 por Don Tomás Leso. (314)

Según las relaciones escritas por el Gobernadór de Santa Cruz, Don Lorenzo Suárez de Figueroa, la Provincia de «Yvytupue» quiere decir, la región gobernada por el cacique mayór Vitupuera, constaba de cinco subdivisiones grandes. Como puede suponerse de la relación citada, constaban estas subdivisiones en parte de un pueblo y en parte de varios pueblos y estaban excepto de una, gobernadas por varios caciques. Así es mencionada en primer lugar la subdivisión «Taquirán y Caracará», tratándose verosimilmente de los pueblos que tienen estos nombres. Como caciques de esta primera subdivisión son mensionados tres: así que el número de los caciques no corresponde al número de los pueblos. Así, pues, no se trata de una comunidad fundada exclusivamente en una base

Nota 311. Nord. I. p. 170 y 285.
Nota 312. Carta del Licenciado Cepéda dando cuenta de la guerra a los Chiriguanos encomendada a Lorenzo Suarez de Figueroa Gobernador de Santa Cruz y al Maestre de Campo Fernando de Casorra por Tomina y a Luis de Fuentes por Tarija. Según Moreno II. p. 113.
Nota 313. Moreno II. p. 121 y 126.
Nota 314. Moreno II. p. 244.

territorial. Por la segunda subdivisión son mencionados tres nombres: Aguapea, Naipea y Traybi. Pues ella constaba verosimilmente de tres pueblos. De esta subdivisión el número tres de los pueblos corresponde al número de los caciques. La tercera subdivisión es llamada Tamborá. Pues, es presumible que ella constaba solamente de un pueblo y es mencionado también solamente un cacique. La cuarta subdivisión se llama Tendy y son mencionados tres caciques de ella. Se dice que uno de esos caciques, llamado Abaqué, era el hijo del cacique Tendy, pues de aquel cacique que dió su nombre a esa subdivisión. De la quinta subdivisión Ayaguá o Cayaguá son mencionados hasta cuatro caciques. (315)

También de la parcialidad Chiquiacá son mencionados fuera de su cacique mayór Chiquiacá o Chiacá, 14 otros caciques, pero no se puede decidir, de estas indicaciones, hasta que punto se trata de nombres de caciques sucesivos o contemporáneos.

Interesantes noticias tenemos del siglo XVI sobre la manera de como las comunidades particulares de los Chiriguanos distribuyeron entre si los diferentes paises en que ellos hacian sus depredaciones. En la «Confesión de Blas Negro» se dice «que los de la provincia de caypuru les cabia la parte de tomina, y los de coyagua a los churumatas, y los de tendi hazia misque é tiraque, y los de aguapea hazia este camino de poxo y santa cruz» (316)

Ya en el cuadro histórico compuesto al principio de ese trabajo, se mencionó que los Chanés y tambien otras tribus, han sido subyugados por los Chiriguanos y incorporados como súbditos a las comunidades de estos. Las comunidades de los Chanés que habian estado primordialmente en el territorio de los Chiriguanos o en sus contornos habian sido exterminadas hasta que al fin del siglo XIX, cuando los Chiriguanos perdieron su independencia por causa de los blancos, los Chanés se emanciparon de sus opresores y habitaban otra vez sus pueblos separados y gobernados por sus propios caciques mayores. Tenemos una indicación interesante en los «Comentarios de Alvar Nuñez Cabeza de Vaca» por la que conocemos que los Chanés en tiempos pasados antes de ser subyugados por los Chiriguanos, tenian una organización social, firme y poderosos caciques mayores. En Puerto de Reyes, Alvar Nuñez se encontró con un cacique Chané que anteriormente habia acompañado a Garcia en su regreso del Perú y, más tarde, despues del asesinato de Garcia por los Guaranies, habia huido de estos. Entre otras cosas ese cacique declaró: «que en su tierra los de su generación tienen un solo principal que los manda a todos y de todos es obedecido, y que hay muchos pueblos de muchas gentes de los de su generación» (317) Los Chanés subyugados fueron repartidos a las diversas comunidades sociales de los Chiriguanos como súbditos o esclavos. En la «Relación del Corregidor de Tomina Don Juan Arce de Alvedin», del año 1618, se dice que en la Provincia de Machareti» que es Pilcomayo y sus contornos» vivian Chiriguanos puros cuatrocientos escasos a las cuales estaban repartidos 5.000 Chanés «qual a duzientos qual a ciento qual a sesenta y de esta forma hasta el número dicho». En la Provincia de Charaguay eran repartidos, de la misma manera, a los 350 Chiriguanos de esta provincia 4.000 Chanés y a los 200 Chiriguanos de la Provincia de Guapay, 1.000 Chanés para arriba. Como en otros documentos, también en este, se menciona el mal tratamiento que tenian que sufrir esos súbditos de los Chiriguanos y, el odio que aquellos tenian a sus opresores. (318) Los Chiriguanos llamaban a los Chanés despectivamente «tapií», mientras que aquellos mismos eran llamados

Nota 315 Moreno II. p 123 y 124
Nota 316 Moreno II. p. 130.
Nota 317. Moreno II. p. 30.
Nota 318. Moreno II. p. 25» y 104

por estos como «cheya» quiere decir «mi amo». (319) Aunque la mayór parte de esos subditos o esclavos constaban en Chanés, habia también entre ellos otros indios que fueron subyugados en las expediciones, así por ejemplo indios Chichas (320) y entre los Chiriguanos de Tendi también indios Guaiucos. (321) Según Techo (322) cuya relación fué escrita en la segunda mitad del siglo XVII, los Chiriguanos solian vender algunos de sus esclavos a los Españoles.

Fuera de esos súbditos incorporados directamente a las comunidades Chiriguanas, existian diversas tribus de indios, subyugados por los Chiriguanos, que eran tributarios de estos, quiere decir de sus parcialidades particulares. Esas tribus tenian que entregar tributos determinados y prestar servicios como auxiliares de guerra. (323) De esta manera eran tributarios de los Chiriguanos de la provincia de Yvytupue, los Tamacocies, los Xores y los Yurucarés. En la «Carta de Don Lorenzo de Figueroa» del año 1584 se dice que los Tamacocies y Xores y Yurucarés no habian auxiliado a los Chiriguanos de la parcialidad de Vitupue viendo que estos fuesen derrotados por los Españoles. De esa noticia puede suponerse que ellos, como tributarios, hubiesen sido obligados a auxiliar a sus dueños. De la «Confesión del Blas negro» que habia vivido mucho tiempo como prisionero entre los Chiriguanos, nosotros conocemos en qué constaban los tributos que las tres tribus tributarias tenian que entregar a la parcialidad de Ybytupue. (324) «Dan tributo en esta manera, los Xores yervas ponsoñosas para sus flechas, y los Tamacozies yndios yndias arcos y flechas y pescado y caza y guacamayos y los Yurucares les dan cocos y plumas de pavos y chonta de palma para hacer flechas.» Además es dicho por el mismo garante que los Chiriguanos de Tendi y Aparo, Agunpea y Caripui hubiesen contratado con los Chuis-indios del pueblo del Misque, a proveerlos» de polvora salitre piedra azufre ochas coronas chipatos tixeras cuchillos y otras cosas.» (325)

Según todo lo que conocemos de los documentos antiguos, las comunidades de los Chiriguanos, quiere decir, las parcialidades bajo de la jefatura de caciques mayores, y las subdivisiones bajo la jefatura de caciques comunes, tenian en comparación con otras tribus de indios Sudamericanos una organización muy firme. El cacique mayór manda a sus súbditos y estos le obedecen asbsolutamente. Es verosimil que respecto a eso el ejemplo del imperio absoluto de los Incas del Peru vecino ha influenciado en la organización de los Chiriguanos. Todavia en el tiempo, del viaje de Erland v. Nordenskiöld, en el año de 1908, los caciques de los Chiriguanos y de los Chanés eran muy poderosos en contraste a los caciques de las tribus vecinas del Chaco. Todavia en aquel tiempo existian caciques mayores, que gobernaban un grande territorio que constaba de varios pueblos' y caciques comunes que gobernaban a los habitantes de un pueblo o a una parte de ellos. Así eran gobernados en el tiempo del viaje de Nordenskiöld, la mayór parte de los pueblos del valle de Caipipendi por un cacique mayór llamado Tarniri El cacique mayór, Mandepora, tenia, antes, un poder considerable en y cerca de Machareti y el cacique mayór Maringay en el valle de Iguembe. Tenemos la indicación interesante de Nordenskiöld de que entre los Chanés también mujeres pueden ser caciques mayores. Así era cacique mayór de los pueblos de los Chanés en el Itiyuru una mujér, llamada Vuáyruyi, que había sucedido en ese oficio a su hermano fallecido. Porque ella ya era vieja ella era reemplazada en sus funciones por su sobrino Vocapoy que era el hijo mayór de su hermano y prede-

Nota 319. Moreno II. p. 284.

Nota 324. Moreno II. p. 121 y 125.
Nota 325 Moreno II. p. 121.

cesor. Su hijo era predilecto como cacique mayór después de Vocapoy. (326) Entre los Chanés en el Itiyuru y, antes, cuando los Chanés del Parapití tenían todavía un cacique mayór, también entre estos el oficio del cacique mayór era ligado a una cierta familia, mas no pasó del padre al hijo. Nordenskiöld apuntó de la familia de los caciques de los Chanés en el Itiyuru un arbol genealógico según que, después del cacique mayór, Hinu Parava, dos hijos de este sucedieron sucesivamente en este oficio. Después del fallecimiento del ultimo de estos, fué la hija de Hinu Parava cacique mayór, la mencionada Vuáyruyi, mientras que el hijo de su hermano fallecido y predecesor, como ya mencionamos, la reemplazó en sus funciones. El predestinado al oficio del cacique no puede entrar en sus funciones sino tiene capacidad y la habilidad de discurrir. El cacique mayór en el valle de Caipipendi fué tenido por incapaz por causa de su embriaguez continua y fué reemplazado en sus funciones por uno de sus parientes. (327) En los pueblos de los Chanés en el Itiyuru también los caciques comunes pertenecen a la familia de Hinu Parava. (328)

Como símbolo del cacicazgo. Nordenskiöld vio [illegible] guarnecidos de plata y, la llamada «Yandagua» que consiste en una pértiga adornada con un penacho de plumas de avestrúz y es traido por los caciques en las fiestas y bailes. Según Corrado, las caciques antes traian como símbolo de su oficio un mechón encima de la cabeza que llamaban «yattira» y, piedras verdes como pendientes en los lóbulos y, en las fiestes además de la mencionada «yandagua» el «iguiripe» que era un bastón entallado con figuras. (329)

Al lado de los caciques tienen una posición especial los hechiceros, entre los cuales los Chiriguanos diferencian dos especies, los «ipáye» que son buenos y remedian hechicerias y, los «ipáyepótchi» los que pueden remediar hechicerias pero también hechizan. El hechicero es sobre todo también el médico que tiene la obligación de curar enfermos. (330) En general el oficio del hechicero es separado del oficio del cacique. Solamente en Ivu, Nordenskiöld observó el caso de que el cacique de los Chiriguanos era a la vez el hechicero. (331)

Las desigualdades que antes existian entre la clase de los Chiriguanos propios y la clase de sus súbditos que constaban por la mayór parte de Chanés, hoy no tienen más importancia después que éstos se anticiparon, desde el fin del siglo pasado y tienen otra vez sus caciques mayores y caciques comunes propios. Fuera de que los miembros de la familia a que pertenecen los caciques tienen alguna preferencia (332) hoy, existe apenas una diferencia entre los miembros de la misma comunidad de los Chiriguanos respecto a la economia de su vida. Pero sí, puede existir una tal diferencia entre las diversas comunidades mismas, conforme a las condiciones de la producción en los diferentes lugares. También el trabajo se distribuye, hoy después de la emancipación de los Chanés, más o menos igualmente entre los miembros de la comunidad, del mismo sexo. El cacique mayór y su mujer participan a los trabajos comunes. Están solamente exceptuados de esta regla algunos indios, que se han acomodado a la situación moderna y mandan a trabajar miembros de su tribu propia como sirvientes (333)

Una desigualdad de importancia práctica existe casi solamente entre los dos sexos y, sobre todo, respecto a la distribución del trabajo. Respecto al cum-

8: Schmidt SF10 Chiriguano

plimiento de las necesidades, esta desigualdad entre los dos sexos no aparece sino en eso de que los hombres y mujeres comen separados y si, los hombres en general los primeros y después las mujeres y las criatusas. (334) Nordenskiöld ha combinado un cuadro exacto de la distribución del trabajo entre los hombres y las mujeres. (335) Según este cuadro están proporcionados a los hombres solos los trabajos siguientes: La caza, el plantar y el rozar, el labrado de la madera, el torcer cordones, el hacer redes, el trenzar esteras y cestas, el labrado en cuero, la fabricación de armas, el ornamentar las cuyas y calabazas y la edificación de las casas. A las mujeres solas están proporcionados los trabajos siguientes: El transporte del agua, el cocer, la fabricación de las bebidas fermentadas, el recojer frutas y raices, la cerámica, la fabricación de las hamacas, el hilar y al trenzar vendas. A los dos sexos están proporcionados los trabajos siguientes: La pesca, con la diferencia de que las mujeres prenden los peces pequeños en agua baja, mientras que los hombres pescan en el agua honda, el sembrar el cosechar, el cocer—Atribuido en lo que precede a las mujeres—en cuanto que los hombres participan a las veces a la preparación de lo cazado, el traer leña lo que es las más de las veces ocupación de los hombres, mas entre los Chanés en el Parapití también de las mujeres, la cria de ganado, la costura y el tejer, en cuanto que en algunas regiones también los hombres tejen mientras que, en general, el tejer es trabajo de las mujeres. También las criaturas participan, según el sexo, a los trabajos respectivos de sus padres así principalmente a la cosecha (336) y aprenden de esta manera, viendo é imitando, ya desde temprano los trabajos que tienen que hacer en su vida más tarde.

Ya mencioné, en el capítulo respectivo a pueblos y casas, que los pueblos de los Chiriguanos, antes, constaban solamente de pocas casas de las cuales cada una estaba habitada por hasta 100 personas. Hoy, vive, por lo común, en cada casa solamente una familia, mas, muchas veces, junto con los esposos de las hijas, los que viven un tiempo antes de las nupcias y también el primer tiempo del matrimonio en la casa de la suegra. (337) El Chiriguano roza un pedazo de tierra para su hija de lo que el yerno puede ocuparse haciendo siembra y cosecha. (338)

La moza es nubil cuando ella ha pasado, después de la primera menstruación, una cierta ceremonia, la que dura hasta que sus pelos cortados cortos han crecido otra vez medio largos. Esa ceremonia de las mozas que es llamada «yimundia», consiste en que ella es puesta en una especie de apartado dentro de la casa. Hasta la menstruación siguiente ella tiene que guardar dieta y no debe comer sino maiz cocido y harina. (339) Solamente en compañia de su madre ella debe salir temporariamente, del apartado para bañarse y hacer sus otras precisiones. (340)

De los Chanés sabemos por Nordenskiöld que también los muchachos de 10 hasta 12 años de edad tienen que pasar ciertas ceremonias las que consisten en que un hombre especialmente experto en eso les perfora al labio interior (341) y pone un palito por la perforación y, su abuelo les produce hondas heridas en el cuerpo para que sean valientes para el combate y para la caza y, los conduce de la mañana, cuando hace frio, a bañarse. (342)

Las mozas de los Chiriguanos y Chanés son guardadas por sus madres hasta

Nota 342. Nord. 1. p. 211.

8: Schmidt SF10 Chiriguano

sus nupcias (343) y, raras veces nacen criaturas ilegítimas. (344) Las nupcias se hacen entre los Chanés a la manera de que el joven que quiere casarse manda a los padres de la moza varias piezas de caza. El pone leña delante de su casa y, si esta es usada, eso significa consentimiento. Pero solamente después de haber trabajado por un año para su suegra futura él puede casarse con la moza. La noche antes de las nupcias, que son celebradas bebiendo bastante chica, el joven duerme con la moza. (345)

Mientras que los hombres jóvenes tienen una mujer sola, los hombres más viejos y, principalmente los caciques, tienen muchas veces varias mujeres. Así poseia el cacique mayór sustituto en el Itiyuru cuatro mujeres las que vivian en diferentes pueblos y el cacique Maringay tenia dos mujeres las que vivian juntos. (346) Matrimonio entre hermano y hermana está prohibido mientras que primos y primas pueden casarse. (347)

A la mujer embarazada están prohibidas ciertas comidas. Así, entre los Chanés en el Itiyuru una mujer embarazada no puede comer palomas. Mas ellas hacen sus trabajos hasta que deben partir. (348) Después de nacer una criatura el hombre pasa la «couvade» que consiste en que él se queda acostado varios dias y guarda una cierta dieta. Entre los Chanés en el Parapití él puede comer, los primeros dias, solamente maiz cocido y sopa de maiz y no carne. (349) Más tarde él puede comer batatas dulces. Cuando la criatura principia a andar es dado un nombre a lo mas, no por sus padres, pero sí, por sus abuelos. Al nombre propio son añadidos muchas veces, más tarde, ápodos. (350) Huérfanos son criados por sus parientes. (351)

Desde los primeros tiempos de su inmigración a la Sierra de la Cordillera, los Chiriguanos, quiere decir sus parcialidades, hicieron la guerra o asaltos a las tribus de indios vecinos o a los Españoles. En el cuadro histórico compuesto al principio de este trabajo, yo he descrito a grandes rasgos estas hostilidades. Sus armas de guerra eran arcos y flechas y la macana. Los caciques eran a la vez jefes en la guerra. Según la indicación que hizo un cacique de los Chanés a Nordenskiöld, estos indios tenian, antes, la costumbre de traer en casa las cabezas de los enemigos muertos y de exponerlas en las fiestas en la plaza del pueblo. (352) Ya en el siglo XVI la capacidad de los Chiriguanos a la guerra es reconocida por los Españoles. En la «Declaración de Sebastian Perez Chamoso» del año de 1571 se dice de ellos: «Con las ynvenciones y asechancas y orden de guerra que tienen han hecho y hacen dichos daños en los españoles yndios y servicios que hay en las dichas chacras». (353) Antes de que los Chiriguanos ejecutaran su asalto al Rey Guacane hicieron reconocer por espias los Llanos de Grigota por donde estaba el Rey. (354) Sus pueblos descritos en lo que precede, estaban fortificados fuera de su posición natural por cercos. Ruiz Diaz de Guzman encontró en su expedición contra los Chiriguanos un pueblo proximo al Pilcomayo que estaba fortificado por dos cercos concéntricos de piedra y de madera. (355) Datos interesantes sobre las fortificaciones que hicieron los Chiriguanos en sus guerras los encontramos en la «Relación y breve noticia de lo sucedido en la guerra de Chiriguanos que se ha hecho este año de 1729 por orden

del señor Virrey y Real Audiencia de Chuquisaca por el Padre Bartholomé de Mora». (356) Estas fortificaciones son descritas en la forma siguiente: «Proseguiendo su camino (los Españoles y Chiquitos) ya de dia claro, como de una legua dieron con una trinchera, que atajaua el paso, muy fuerte y bien dispuesta, con palos muy gruesos, clavados en el suelo, q' hacheados a modo de tablones, tenian sus troneras por donde disparauan las flechas. Aqui se encontró mucha resistencia, por estar la trinchera muy bien fortalecida, y ser muchos los yndios que la defendian.» En otro lugar se dice: «Prosigiose el camino estando ya todos juntos, y llegaron al lugar, donde los enemigos se auian hecho fuertes. .. Era el fuerte una barranca cortada a modo de paréd, que solo tenia una subida muy estrecha, y empinada, que sembrada de ramas espinosas, la hacia más impenetrable. En cuya eminencia tenian atrincherada la puerta con palos clavados en la tierra.»

Hoy, los Chiriguanos y Chanés no hacen mas la guerra a otros indios fuera de eso, los Chanés en el Parapiti hacen ocasionalmente expediciones contra los indios Tsirakua. (357)

EL DERECHO

Porque las autoridades de los blancos intervienen más y más en las tradiciones jurídicas, primordiales, de los Chiriguanos y Chanés hoy ya no existen muchas de ellas y, también de las pocas indicaciones que Nordenskiöld da respecto a ese asunto de 30 años atrás, muchas hoy ya no corresponden a los hechos.

Respecto al derecho penal encontramos entre esos indios una mezcla entre el principio de la «vendetta» y la práctica del derecho penal. Entre los Chanés, en el Parapiti, la mayór parte de los delitos y, principalmente el hurto, fueron arreglados por medio del duelo. En caso de un hurto aparecen el que hurtó y el hurtado, cada uno junto con sus parientes en la plaza del pueblo para combatir el uno con el otro. Solamente el homicidio, la seducción de una mujer y la hechiceria eran sentencionados por el cacique mayór, como juez. Homicidio que, antes, acontecló entre los Chanés en la forma de envenenamiento con chicha envenenada («bád dyási») y la hechicería eran castigados con la quema del criminal. El seductor de una mujer, perdia sus bienes; (358) Según las indicaciones del cacique mayór sustituto de los Chanés en el Itiyuru era la obligación principal del cacique el que evitase la vendetta, enviando a otra parte a los criminales para que no fueran matados. Asi los ladrones, después de haber recibido 50 varazos eran mandados para otro pueblo. El homicida era condenado a trabajar hasta un medio año para la familia del muerto. (359)

Propiedad individual es bastante valida entre los Chiriguanos. Según Métraux también los parientes más allegados no pueden disponer de las cosas de uno de los suyos sin su asentimiento. La posesión de un terreno está asegurada a un Chiriguano por plantar cualquier planta en él o por limpiar la circunferencia del terreno requerido y hacer grandes entalladuras a los árboles. Escogiendo un terreno para su plantación, el Chiriguano examina cuidadosamente si no existian rastros de una plantación anterior. (360)

Después de haber sido rozado el terreno, escogido para la plantación, son convocados los parientes y amigos para ayudar al trabajo. Antes, también el cacique del pueblo participaba vigilando por los trabajadores. (361)

LA RELIGION

En los muchos años de su actividad, las misiones naturalmente han influenciado notablemente en las ideas religiosas de los Chiriguanos y Chanés. La mayór parte de ellos son hoy cristianos. Algunos han conservado todavía una parte de sus ideas primordiales, exprimidas en sus leyendas. Yo me limito aquí, a remitir al lector otra vez a las leyendas de los Chanés apuntadas por Nordenskiöld (362) y, varias veces mencionadas en lo que precede. También tengo que citar la publicación de A. Métraux: «Les Hommes-Dieux chez les Chiriguano e dans l'Amérique du Sud», (363) en que son tratados los casos, varias veces repetidos, en que algunos individuos entre los Chiriguanos aparecen como Mesias y adquiriendo muchos prosélitos dieron mucho que hacer a las administraciones de las misiones.

OBJETOS TRENZADOS, DE LA COLECCION, EMPLEADOS EN FIESTAS RELIGIOSAS

I. A. 1439. (Chiriguano), Largór 70 cm. (Fig. 43 b.)
I. A. 1440. » » 37 cm. (Fig. 43 a.)

Figuras trenzadas como las mencionadas en lo que precede son muy comunes también entre los Paraguayos y hechas en la misma forma. Esta costumbre de fabricar tales figuras trenzadas y hacer bendecirlas, como también los Chiriguanos lo hacen, está en conexión con el rito católico y, los Chiriguanos la recibieron, sin duda junto con los demás ritos de la religión católica de los misioneros. (364)

También las máscaras que los Chiriguanos fabrican para llevarlas al curso de las fiestas de Carnaval son objetos modernos. Algunas de tales máscaras de los Chiriguanos están representadas por dibujos por Nordenskiöld y por Métraux. (365)

LA LENGUA

Ya mencionó en lo que precede que los Chanés primordialmente hablaban otra lengua distinta de la de los Chiriguanos, pero que aceptaron durante el largo tiempo de su cautiverio la lengua de estos. Un cacique de los Chanés del Parapití, llamado Batirayu, dijo a Nordenskiöld que algunos de los Chanés sabían todavía algunas palabras de su lengua primordiál, y que tenía hoy el caracter de una lengua secreta. Así muchas veces se usan todavía invectivas de la lengua primordial de los Chanés, como: «karitimisóyti» lo que los indios tradujieron como equivalente a «hijo de puta». También encontranse canciones en la lengua primordial, por ejemplo: «siparakinánoye, siparakinánoye, siparakinánoye, tonéya tonéya, tonéya, tonéya;» pero que ellos no pueden traducir. Nordenskiöld no logró sinó con mucho trabajo y paciencia apuntar 6 palabras de la lengua primordiál de los Chanés en el pueblo Huirapembe en el Parapití donde se dijo que vivían algunos indios Chanés que sabían todavía su lengua primordial .De la Comparación de estas 6 palabras con las palabras correspondientes de la lengua de los Mojos resulta su grande semejanza con esta, así que no puede ponerse en

VOCABULARIOS DE LOS CHIRIGUANOS DE MACHARETI Y DE LOS IZOZÓS DEL RIO PARAPITÍ

ANOTACIONES SOBRE EL ALFABETO DE LOS VOCABULRAIOS

Publicando en lo que sigue los vocabularios de los Chiriguanos y de los Izozós, los que apunté en Machareti (Chirignanos) y en Toledo (Izozós) yo empleo el mismo alfabeto de mi publicación anterior del vocabulario de la lengua Guarayú, en esta misma revista. (Tomo III. N. 6)

LAS VOCALES

a; e; i; o; u. : vocales largas.
a; e; i; o; u. : vocales breves.
ã; ẽ; ĩ; õ; ũ. : vocales nasales.
ɨ : vocal guttral (como en Guaraní y agua.)
ä=ä en alemàn (como en : Bär=oso.)
ü=ü en alemán (como en : Übel=malo.)
ai ; au; oi son diptongos.
ai=ei ò ai en alemán (como en: Ei=huevo).
au=au en alemán (como en: Auge=ojo).
oi=eu en alemán (como en: Teufel=Diablo.)
aĩ es diptongo nasál.

El apóstrofo atrás de una vocal (a'i; a'u; o'i) indica que esta no forma diptongo con la vocal siguiente.

LAS CONSONANTES

Las consonantes aplicadas en los vocabularios de los Chiriguanos y de los Izozós son las siguientes:

b; d; (f no se usa.) g=g en alemán (como en Garten=jardin); h es siempre aspirada como en guaraní; j=j en español (como en jabón); k; (l no se usa) m; n; p; r; s=c en español ante i (como en cielo); t; v=w en alemán (como en Wagen=carro); y=y en Nueva York, es exclusivamente aplicada como consonante; z=z en francés; ch corresponde a la ch en español; sh=j en francés como en je=yo).

La silaba acentuada de los vocablos se indica por medio del acento agudo.

Nota 366 Nord 1. P. 187.
Nota 367. Según Padre Pedro Marban: Arte de la lengua Moxa con su vocabulario y catheciamo. Publicado nuevo por Julio Platzmann. Edición facsimilar. Leipzig 1894.

621. pintar.	cheamimpîta	odyegná

Para completar los dos vocabularios apuntados por mi de los Chiriguanos é Izozós tengo que mencionar todavia algunas palabras de los Chiriguanos y Chanés las que se encuentran dispersas en el texto de las publicaciones citodas de Erland v. Nordenskiöld. El alfabeto aplicado por Nordenskiöld ha sido conservado en la apuntación de estas palabras.

tierra. salada.	yukiu
las dos estrellas más grandes en el Centauro.	yánduipoy.
Venus.	coemilla.
Orion.	húirayúasa.
Pleyadas.	ychu
La Cruz del Sud.	yánduinyaka. (Chané)
parte de la via láctea cerca de la cruz del Sud.	yandurape.
aerolito.	baerendi.
resina especiál para barnizar las vasijas de barro cocido.	taraviruti.

rancho para cazadores.	tocay.
palitos para producir fuego.	tatay.
palo como utensilio de plantar.	carúmpa.
boleadora.	churima.
vasija para chicha.	yambuy.
chicha buena	cangui
chicha envenenada.	bád-dyási.
plato de plata.	cagua.
disco para el labio	tembeta
camisa de poncho para fiestas.	tirucumbai
vestido para mujeres (tipoy).	tiru,
mechón de los caciques.	yattira.
pértiga adornada con un penacho de plumas de avestrúz para los caciques.	yandugua
bastón entallado con figuras para los caciques.	iguirape.
pelota blanca para golpear con la cabeza.	toki
juego con pelota golpeando con la cabeza.	toki. (Chané del Parapití).
juego de pelota golpeando con palo o con raqueta.	táca. (Chané del Parapití).
juego de bolo, de las mujeres.	itarapóa. (Chiriguano en Tihuipa) tocoróre. (Chané del Parapití).
juego con flechas provistas de marlo de maiz.	sóuki. (Muchachos del Parapití).
juego con dos palitos	huirahuahua. (Muchachos de los Chanés del Parapití).
juego con palitos derribando un botón de una piedra.	paraná.
juego con dados.	daro. (esp. Muchachos Chiriguanos en el valle de Caipipendi).
juego con cuatro tablitas	chúcaráy. (Chiriguano). chunquánti. (Chané).
juego con palitos.	tsúcareta.
palitos del juego «tsúcareta».	máma.
ceremonia de menstruación de las mozas.	yimundia.

hombre.	ava.
mujer.	cuña.
hechicero bueno.	ipáye.
hechicero malo.	ipáyepótchi.
grande espiritu	añatunpa.
espiritu.	tunpa.
el muerto.	aña.
pueblo de los muertos.	aguararenta.
planta esp.	yúag.
fruta del algarroba.	mä.
samuu. (arbol)	samuo.
arbol esp.	urunday
planta esp.	supua.
semilla de una planta empleada para los cabellos.	nyantéra.
planta esp.	ikuahuasu
melon esp.	anday.
tigre.	yahuéte.
puma.	yahuapinta.
gato del monte. (grande)	embaracaya.
viscacha. (esp. chica; Langostomus)	tacumbocumba.
sorro.	agara.
murcielago.	andira.
tatú esp.	taturapua.
avestrúz.	yándu.
condor blanco.	ururuti
golondrina.	máchurupimpi
caracará.	kara-kara.
colibri.	chinú.
deferentes especies de aves:	urapua; tiu; choe; churincui; tayuyu; kése-kese; choncho; aragua; tavatán; toste; huapi; húiram.
boya grande	boybuasu.
tortuga.	carumbe
mosca.	mberu.
pulga.	tuáta.

garrapata.	yatáu.
hormiga esp.	isáu.
escarabajo esp.	nyákira
escarabajo esp.	tikitikiru

Indians in the years 1908, 1909 and 1913, and spent in all 4 to 5 months studying them. In my book »Indianlif» I gave a popular account of them as I got to know them during the Hermmarck expedition in 1908 and 1909. In my last book of travel »Forskningar och äventyr i Sydamerika» there is some information about the Chiriguano. I have brought home to Sweden from the Chiriguano and Chané about 1500 articles which are now in the Riksmuseum at Stockholm and in the Gothenburg Museum. In the Geographical Review I wrote a short article on the migrations of the Chiriguano Indians.

C Ce [126]

C Ce 12 114

A close study of the Chiriguano and Chané civilization by the ethno-geographical method affords points of especial interest, since their mode of life is rather well known, and we are able to trace their history back to the beginning of the 16th century. I have also collected archaeological material from their region. At first I was minded to give an account of this, too, in the present work. I decided, however, that it would be better here only to mention individual finds by the way, and to leave the archaeological material for another publication in which I shall be able also to publish certain archaeological finds made in other parts of Bolivia. This for purely practical reasons.

C Ce 121

I will here endeavour to make clear how the Guarani-speaking Chiriguano's and the Guaranized Chanés' civilization are composed, what culture-elements they have got from the Whites and from the Mountain civilization in the west, what each brought to the common stock and what they possibly obtained from other quarters.

In this analysis of Chiriguano and Chané manners and customs, I do not intend properly to examine the question as to whence these Indians came to their present abodes. Broadly speaking we know that already. Respecting the Chiriguano migrations there are historical documents extant which evidently show that it was not until the beginning of the 16th century that these Indians conquered

C 175 648 167

/295/ Preface

114 In the chapters to follow, I propose to publish part of the
● 12 results obtained in the course of the expedition that I undertook in the Bolivian and Argentinian Chaco in my capacity as director of the Institute of Ethnology of the University of Tucumán.

114 This expedition took place from February to June, 1929.
[101] Its itinerary was the following: Having left Tucumán, I went by railroad to La Quiaca where I stayed for several days, making observations on the more or less half-breed natives of the region. From La Quiaca I went to Tarija, where I remained longer than I might have wished because of the suspicions my trip raised at the time of the Paraguayan-Bolivian conflict.

114 After a 15-day stop I left Tarija to reach the Chiriguano
101 tolderías of the upper Pilcomayo. I crossed the village of Santa
103 Ana, then the Alta del Cóndor, the Narvaez River, the post of San Diego, passed five kilometers from San Luis (Entre-Ríos) to stop at the Cuesta de San Simon, where I found the first Chiriguano. Once having crossed the Cuesta de San Simón I quickly reached the Salado River, then the Chiriguano villages of Timboy
[126] (Saladito). It was there that I made my best acquisitions of pottery and where I collected the oldest objects. The inhabitants
[178] of these rancherías, who live relatively far from the highway from Argentina to Santa Cruz, have preserved the traditions and culture of their ancestors better than their racial brothers have. From Saladito I reached the village of Itasiti and then Salado Grande,
[361] in order /296/ to reach the Pilcomayo at the confluence with the Salado. There, the Chiriguano villages are large and numerous. The most interesting are those of Ñawirenda, Ibopeytí, and Tumbía.

After stopping for some time in this place, I continued my trip toward Huacaya and the mission of San Pascual de Boicovo.

In one day I went from Boicovo to Cuevo, going by way of the mission of Santa Rosa.

[199] From Cuevo on I was in the mission of Ivu, which is without
[178] doubt the one where the old Chiriguano customs have undergone the fewest modifications.

/296 cont./

114 101 103 From Cuevo I left for the northwest toward the Parapiti River region. I crossed this river near Pipi. After stopping in that village, I followed an Indian path which led me to Caurari, to the home of my good friend Captain Kamapadyi. I spent a week with him and left him only to explore the whole Caipipendi valley, visiting all the Indian villages one after another. At Caipipendi itself I made fruitful excavations and collected interesting myths.

The limit of my trip toward the north was the little city of Charagua.

I devoted the last part of my trip to more or less long stays in the Franciscan missions of Tarairi, Tigüipa, Macharetí, and Ivo.

Before going back to Argentina I made an excursion into the Iguembé valley as far as the village of Masavi.

114 127 The last two weeks of my expedition were devoted to the study of the Chané Indians who live near Aguaray in the Salta Chaco (Argentine Republic).

Previously I had been obliged, for various reasons, to stay at Oran for a month. I took advantage of this to make collections among the Ashluslay Indians who come there for the sugar-cane harvest.

In this volume I shall publish only the results of my expedition which bring new facts and details to light. Therefore the chapters I devote to the Chiriguano must not be considered an exhaustive study of their culture, but simply as a contribution. Chiriguano culture has been the subject of four important works, two of which are by ethnographers of great authority (1). /297/

1. Nordenskiöld (2, 5, and 10) and Rowe (1) /the underlined numbers following an author's name refer to the boldface numbers in the bibliography/. Campana's monograph on the Chiriguano, which I shall often have occasion to cite, is only a recompilation and reorganization of the manuscript notes left by the Italian missionary, the Reverend Father Dominco Giannechini. This work is excellent in many respects. As for the book of the Reverend

/SP1 cont./

Father Bernardino de Nino. It is only a translation of Campana's article, filled out with copious borrowings from Conzdr's work. Nevertheless the Reverend Father Bernardino de Nino added many very interesting details to the texts that he reproduces, which make consultation of his Etnografía chiriguana indispensable.

My aim was to complete the work of my predecessors and to get together for the Museum of Tucumán a collection which would be truly representative of the last of the cultures which formerly flourished within the limits of the old gobernación of Tucumán. My Chiriguano collections, along with those collected by Nordenskiöld, are, I believe, the most complete ones from this region that exist in the world. They bear witness, I hope, to the richness of this area from an ethnographic point of view, a richness which has been left unexploited and which will disappear in a few years.

May these pages demonstrate that every culture is a whole complex, so varied, that no ethnographer can study all its details in the course of a single trip. It is not useless to go back where others have preceded you, for, whatever their merits may have been, the material cannot be exhausted in one time.

There remains the paying of a debt of gratitude by thanking Doctor J. B. Terán and Doctor J. Heller, who, as rector and vice-rector of the University of Tucumán, gave me the means to bring about this trip. The new rector of the University, Doctor J. Prebisch, granted me the sizable funds which publication of the results of this expedition required and supported constantly the Revue d'Ethnologie of my Institute. I am eager to make known to him here how grateful I am.

I wish to express my thanks again to all those who helped me in the course of my trips first and foremost the Franciscan missionaries who gave me generous hospitality and helped me as much as possible; my debt is particularly great to the Reverend Father Jacundo Ferrari, thanks to whom I was able to carry out without damage the transportation of my collections from the upper Pilcomayo to Cuevas; to Father Angiuoni who received me so frequently in his Ivo mission. Neither do I wish to forget Fathers

Introduction

•121 For anyone who wants to verify experimentally, if I may say so, the value of the methods which are being adopted in modern ethnography, for anyone who wishes to judge the factors which condition the formation and evolution of civilizations, there is no better field than the study of the Chiriguano Indians.

We know where they came from, the period when they formed a new nation, the populations with which they mingled or were in contact, the influences they underwent and their duration, and finally we are acquainted with the vicissitudes of their history: in a word, we can be present at the formation and development of this people from their origin to their present decline, an experience unique in South America, rare perhaps elsewhere, and in any case rich in instruction.

Adaptation to the environment, borrowing of new cultural elements, abandonment of traditions and techniques, somatic and linguistic changes, so many problems that the Chiriguano civilization poses and that the historical documents and the collections permit solving or at least clarifying.

1778 1178 Chiriguano culture is composed of elements of different origins, borrowed from tribes which had only a little in common with one another. It involves an old Guarani substratum, transformed and entirely renewed by the contribution of the Arawak culture of the Chané, which itself had been enriched and modified by the influence of the Andean populations of present-day southern Bolivia. A common environment and long proximity allowed many a technique and industry of the primitive Indians of the Chaco to be adopted and assimilated by the Chiriguano. The importance of this third component is minimal.

/299 cont./

177 178 An analysis of Chiriguano culture (see Nordenskiöld, 10, pp. 196-213) makes manifest the heterogeneity which the history of the tribe caused to be suspected a priori. The pottery, basketry, weapons, and furniture almost constantly present disparate characteristics in which are expressed this play of influences, this intermixture of races and ideas of which the present-day culture of the Chiriguano is the product.

/300/ The ethnographer feels all the more at ease in his analysis when at every step history confirms or invalidates the findings to which his comparative work leads him. Thus he walks on firm ground, and the results he has acquired in this particular domain will justify his method when he uses it to solve problems whose data are less complete.

181 The Chiriguano, in more than one respect, deserve to hold a preponderant place in the ethnography of South America. They have played an important role in the history of Bolivia, Paraguay, and Argentina; their civilization has been brilliant and has maintained itself intact almost until our time; besides, they are remarkably endowed from the point of view of character and intelligence. To these qualifications they add that of having built up their civilization, so to say, before our very eyes and of offering to science a field where it moves with some sureness.

In order to understand the point of view I have tried to put forward in this introduction, it is indispensable to know, in its main lines, the early history of these Indians.

Chapter I

000 Historical Outline of the Formation of the Chiriguano Nation

/Eight lines of poetry in Spanish, from Barco Centenera, La Argentina, pp. 185-186, are omitted in the translation./

121 175 My intention is not to recount the history of the Chiriguano from the 16th century to today insofar as we can know it from official documents and chronicles. This work has been done and generally well done (Corrado; Kersten, pp. 66-69; Serrano y Sanz; Nordenskiöld, 7 and 8, pp. 45-58; Gandía, 2, pp. 25-56 and id., 3, pp. 161-196; Church, pp. 206-227; Mujía; etc.).

/300 cont./

and id., 1, pp. 161-196; Church, pp. 206-227; Mujía; etc.). I shall limit myself to tracing here, in their main lines, the characteristics of the great Guarani migration which ended in the formation of the Chiriguano tribe.

The Chiriguano Indians belong to the Tupi-Guarani linguistic family. A branch separated from the great Guarani nation or, more exactly, a swarm separated from the whole group of tribes of Paraguay and southern Brazil called Guarani, they came to establish themselves at the foot of the Andes at the end of the 15th and the beginning of the 16th century after crossing the Chaco plains.

/301/ The causes of this great movement, which swept along so many thousands of Guarani toward the frontiers of the Inca Empire, are explained by the singular attraction which metal objects, clothes, in a word everything that can make life easier and more beautiful, exerted and continue to exert on the Indians. The Guarani of Paraguay and the Tupi of the Brazilian coast had known for a long time about Peru and its riches. From there they used to receive bronze instruments and ornaments of silver and sometimes also of gold (1). At the same time as these objects,

1. On the trade relations between the peoples of the Andes and the tribes of the Chaco, Paraguay, and Brazil, cf. Nordenskiöld, 9, pp. 255-259.

confused descriptions reached them of these mountain peoples, so strange, who lived in stone huts, had "deer with long hair" at their service, and who decorated their persons with brilliant jewels. Bronze axes, necklaces, bracelets, breastplates, diadems, and goblets of silver reached them by a trade route whose exact position is unknown, but which probably used to pass through the northern Chaco. The Chané /Chane/ who lived in direct contact with the populations of the Inca Empire and traded with them, played the role of brokers, and with them as middlemen these tools and ornaments reached Paraguay, passing from hand to hand (2).

2. Hernández, p. 322: "They were asked of what race are those who have the silver and the

/375 cont./

Calabashes

415 In each Chiriguano village calabashes are as abundant as pottery (see Fig. 47 /see p. 139 /). The huts are full of them. They are of every shape and size, from the spoons we spoke of to the big basins in which the kāwi is distributed on feast days.

[286] The calabashes which are ovoid or gourd-shaped are generally enveloped in a kind of rudimentary net of vegetable fibers or leather thongs, which allows them to be carried in the hand or hung (1). In them is put either water, or grain

415
286
171

1. Nordenskiöld (10, p. 97) has given the list of the South American tribes who put their calabashes inside a net to carry or hang them. This contrivance is widespread on the continent and its distribution is certainly greater than that indicated by Nordenskiöld, but travelers generally take only slight interest in such details, which are nevertheless important. The Kaingúa of Paraguay encompass their calabashes with wembé bark just like the Chiriguano (see Ambrosetti, 2, p. 716).

415 and seed, or roasted flour, or finally roucou or kalasapa powder saved for feast days (Plate XX, 1 and 2; Plate XXI, 3 and 4).

[322] Some calabashes are provided with a lid which the Indians make by cutting a calotte with star-shaped edges in the still green fruit, and this then forms a hermetic closing. The lid is fastened on by means of a small cord which, when pulled, suffices to close the calabash /376/ (Plate XX, 4 and Plate XXI, 2). Gourds whose opening is small in diameter receive a fragment of a shelled ear of corn as a stopper. /Figs. 42-47 appear here./

[121] Painted, pyrographed, or incised calabashes will be the object of a special study.

/382 cont./

804 439 [177] The Chiriguano measure the cloth which Syrian peddlers come to offer them with varas, that is, a stick about 80 centimeters long, the length of the ancient Spanish vara. This instrument has been borrowed from the Bolivian half-breeds.

Chapter VI

●121 ## Art among the Chiriguano and Chané Indians

To Professor Félix F. Outes.

The artistic sense of the Chiriguano is manifested in pottery decoration, pyrography, and wood carving.

We shall study these three activities one after the other.

Pottery Technique

114 323 The Chiriguano pottery technique has been studied briefly by Campana (p. 54), following Father Giannechini's notes, and by Outes (3, pp. 122-123), who adds some details communicated to him by the naturalist Holmberg to the ones he took from Campana's work. Nordenskiöld (1 and 10, pp. 142-147) completed on many points Campana's brief survey, so that I myself shall have few new things to note.

317 323 The clay used by Chiriguano potters comes from beds well known to the Indians, where they go from time to time to lay in fresh supplies. It is enough to see old vessels full of earth around a hut to know that a woman lives there still practicing the ancestral industry. Where adequate clay is [439] lacking, pottery is imported. Thus in the Tigüipa mission all the vessels in use were made in Machareti.

323 In order to be used the clay must be degreased with powder /383/ coming from potsherds. Fragments of old vessels are ground in a mortar until, after being put through a sieve, they give a fine powder which is kneaded for a rather

/398 cont./

[266]
[443]

acted as masters and lords of the land, even to collecting a tax from the Chicha Indians. If they did not agree to this, they ate them and even had public meat markets for human flesh.'" /Translated from the Spanish./

175
139
648
[567]
[126]

Chicha women certainly shared the fate of the Chané women reduced to slavery by the bellicose Chiriguano and, like them, brought the secrets of their civilization to their masters. On the upper Pilcomayo I acquired a vessel (Plate XXV), a Panpipe (Fig. 67), and a T-shaped ax (Plate XXIII. 1), found not far from the village of Ibopeytí, well within Chiriguano country. These objects reveal either the existence in this place of an ancient Andean population, Chicha or some other one, which the Chiriguano may have annihilated or assimilated, or active commercial exchanges. In the absence of concrete evidence, the influence of the neighboring Andean tribes would have been demonstrated by the very style of the pottery of this region, which more than that of any other point in Chiriguano territory continues a tradition peculiar to the peoples of southern Bolivia.

437
439

Even today the Chiriguano receive from the half-breed descendants of the Chicha silver objects which probably used to be the object of an age-old traffic, and turquoise beads the latter unearth from the /Plate XXV appears here/ /399/ graves of their ancestors. On their part the Chiriguano go to sell ostrich plumes and pieces of basketry to the half-breeds and Quichua Indians.

121
192

Southern Bolivia is very little known from an archeological point of view. The few excavations which have been carried out there testify that the culture peculiar to the Humahuaca valley continues without appreciable modification. The homogeneity of the civilization which flourished in these vast regions will be even more apparent on the day when the decision is made to undertake the systematic study of this immense territory which includes all the altiplano to the north of the Argentinian frontier and the valleys which form the spurs of the Andes at the edge of the Chaco. It is already evident

[Text Continues on P. 173]

/403 cont./

A P.C 19 531

Latcham (p. 5) says that for a long time he has also had the impression that Chincha culture had played a very important role in the development of the prehistoric art of the north and center of Chile, especially in the Diaguito-Chilean region, that is, the provinces of Atacama and Coquimbo, and that these influences had extended as far as Cachapoal in the south.

After the publication of Uhle's work, Latcham (p. 20) not only accepted his conclusions but even demonstrated the extension of Chincha culture as far as Caldera. Like Uhle, Latcham (p. 20) is of the opinion "that an examination of Diaguito-Argentine pottery would furnish proof that the traces of Chincha and Chincha-Atacama influences are very common in the art of northwestern Argentina, where all the designs reproduced (by Latcham) are found again alone or in combinations with other local motifs. These influences made themselves felt as far as the southeast and even the northeast of Bolivia, as can be ascertained by consulting the works dealing with the antiquities of these regions. In the modern pottery of the Chiriguano many of these same elements persist, as one can realize by leafing through the work of Outes, 3."

C [415] [531] [177]

C 415 177 121

In the pages which follow I shall seek to demonstrate that Chiriguano pottery presents characteristics obliging us to rank it among those which seem to have undergone the influence of the Chincha-Atacama civilization.

A P.C 17 14 21 [648]

Even if the hypothesis of the existence of a Chincha-Atacama civilization must be rejected some day, it is not any less certain that at a given moment the prehistoric tribes of the region of Atacama, of the northern coast of Chile, of the south of Peru and Bolivia, and of the north and northwest of Argentina were united by close relations, which /404/ explain the numerous points of contact of their cultures. Uhle's theory has on its side the advantage of accounting for these analogies whatever may be the reservations we might be able to formulate concerning the date this scholar attributes to the Chincha-Atacama civilization, concerning the importance and the extent he gives it.

/404 cont./

CCD A PC 172 179 121

concerning the importance and the extent he gives it. To the Chincha-Atacama sphere of influence belongs, precisely, the culture of the Andean Chincha and Humahuaca peoples whom the Chiriguano and their Arawak predecessors had as neighbors for centuries.

C Ce 415

2. Analysis of the Influences Exerted on the Fancy Pottery of the Chané and the Chiriguano

C Ce [121]

The criterion of form. -- The influences which have made themselves felt on Chané and Chiriguano pottery are manifested in both form and decoration. In the pages to follow I propose to note the most striking affinities between Chiriguano and Chané vessels and those of the neighboring regions, and also to determine the importance of Guarani or other survivals which we meet here and there.

C Ce [171]

1. Vessels with a subglobular belly, short neck, flared lips, flattened base, constitute the most common type of fancy pottery (Plates XXXV-XL, XLVII-LIII, etc.). Pottery of this category lacks well-characterized counterparts in the Andean zone. On the contrary, they resemble the jars for kaśiri still used by the Indians of Guiana and the Amazon (Koch-Grünberg, 2, Vol. II, Fig. 151, p. 227).

C 415

One of the yambuí (Plate XLVIII, 3)[1] of this type has as handles on each side of the neck two little miniature vessels of the same form as itself. In what is perhaps only the fancy of a native artist appears nevertheless a concept peculiar to the Andean peoples and one in harmony with their style.

C [171]

2. The yapepo (Plate XLV, 1 and 2; LIX and LX)[2] are subglobular vessels with a low neck, provided with a handle which extends from the rim to the belly; they can be considered as yambuí in miniature. This category of vessels has its equivalent in several points of the adjoining Andean zone. Thus in Calama (Atacama Desert) and in Cagua (Yura canton, Porco province) pots have been found which seem to be, from the point of view of form, replicas of Chiriguano yapepo. (Créqui de Montfort, Plate VII, Fig. 8, and Plate VIII, Fig. 11.)

[1] [See p. 221 -- Analyst]
[2] [See pp. 221, 244 and 245 respectively. Analyst]

/426 cont./

531 Lacking them, the study we have pursued brings us the estab-
171 lishment of a very important fact. The existence on the upper
172 Pilcomayo of a pottery /427/ closely related to that of the
105

Ce
531
415

Fig. 83. Chané vessel. Prov.: Tuyuntí (Aguaray, Salta Chaco). On the belly: series of yakú (pavo del monte) in blackish brown on white background. (1/3 nat. size.)

C
531 Quebrada de Humahuaca is an indication which proves in a sure
171 way that the art of the former inhabitants of these regions was
172 identical to that of their neighbors, and perhaps racial brothers,
105 *of the Bolivian altiplano.*

Apropos of the Chiriguano, I believe it is wrong to speak of
S
121 Andean or Inca culture. The first of these terms is too vague and
531 the second partially false. In this chapter I have tried to demon-
171 strate that Chiriguano pottery exhibits close affinities with that
105 of the civilizations which, by their numerous points of similarity,
seem to have undergone a Chincha or Atacama influence and
which preceded Inca Culture.

/473/

Chapter XIII

Toys and Games

524 [126] All the toys which Chiriguano parents make for their children or the latter put together themselves are represented in my collections. Nevertheless, I consider it useless to give a description of them, for Nordenskiöld (2, pp. 193-200) has been greatly /Fig. 133 appears here/ concerned with this and has reproduced all of them. Simply as a curiosity I sketch a doll clothed in the traditional tipoy and the hair of which is intertwined with a ribbon in the Chiriguano manner (Fig. 133). A little bag (Fig. 134) contains a whole assortment of tipoy in miniature. [868] Minuscule vessels and baskets (Fig. 109) have been made for the use of little girls, who, in playing, thus learn little by little to become excellent housewives.

String figures. I have never seen children make string figures (cat-craddle /cat's cradle/), but I know they are acquainted with them. At Cururutí an Indian amused himself by executing a whole series for me, some of which were sewn by the Indians themselves onto the leaves of my notebook. According to the figure they wanted to produce, they used both hands or helped with the mouth and feet (Figs. 135 and 136). The "full moon" (Plate XXXIX, 3) /Fig. 134 appears here/ was made by my Indian who, having sat down, used feet and hands.

524 121 String figures have extraordinary interest from the point of view of comparative ethnography. If they prove themselves identical in two different regions, they can testify to trade or migrations, like certain games which pass from one region to the other without modifying their character or modalities. Games are the most stable of all cultural elements since they are independent of the environment, race, or way of life, at least in general. It is urgent to collect in South America /474/ the greatest possible number of string figures in order to be able to study their distribution. For this continent we know only a very small number, but this, insignificant as it may be, already allows us to establish some very curious facts.

[Text continues on p. 346]

/480 cont./

75 Fig. 16) was present at an analogous treatment also practiced /481/ by a medicine woman on a child at Yumbia, not far from the Salado. She rubbed him and blew on his body (1).

[113] [192]

1. In the Diccionario Chiriguano-Español y Español-Chiriguano, etc. (p. 72), we find the word hunga translated "to rub, to massage" and the sentence Ñiyari Ñerungarunga tein, irói á Ñe with the following meaning: "My grandmother rubbed me enough, but I did not get well." The medicine women, add the authors of the dictionary, use the word hunga to express the act of rubbing with the hand any painful part of the body, especially the chest, without any remedy other than the saliva they spit on their hand. These women attribute a special virtue to saliva. [827]

755 756 The sick boy's father told me that, once suffering from prolonged headaches, he had had recourse to a sorceress, an old woman with woolly hair, who was called the Samba. She sucked the place where the ache was localized and drew out worms from it. The half-breed got well, of course.

757 [825] In the toldería of Ñawirenda, where there was a child ill with fever, his mother had made him eat crushed garrapatas (ticks). The unfortunate child's lips were purple from it.

756 755 [121] I shall devote a special study to Chiriguano medicine men in a future volume of this Review. Meanwhile I shall limit myself to describing, according to the Diccionario Chiriguano-Español y Español-Chiriguano (pp. 166-167), the way in which these powerful personages customarily proceed when they are called to the bedside of a sick person. I am forced to have recourse to the observations made by another for lack of having been able to be present myself at the spectacle which Father Giannechini evokes with as much accuracy as vivacity. The great Chiriguano paye are now all in the Ivoka where they take

/xii cont./

arms of the Delegation and the forts, which they know how to burn frequently; the Tapiete continually threaten the farthest outposts and all their personnel, because the cannon and bayonet are powerless to civilize and to implant in the iron breast and crude heart of the savage /xiii/ humanitarian ideas, philanthropical ideas, because the cannon destroys, it does not civilize.

121 [119] I shall not concern myself with these tribes in the course of my pages; a book could be written about all of them, studying their origin, their customs, their relations with the other tribes and even with the whites, their relations with invisible or imaginary beings, their language and their deeds, but I renounce this arduous task and concentrate upon the Chiriguano race, which was conquered by the missionaries of Tarija long before South American Independence and later by the fellows of the Colegio de Potosí from the year 1870 through a region closed to trade and civilization.

The first thing I shall do in the course of these lines is to set down a description of the Chiriguano region, after which will follow: the origin of the tribe or race, language, statistics, physical and moral character, religion, political organization, the people, customs, imposition of the tembeta /lip plug/ on the males, fasting of the maidens, sicknesses, wars, songs, gatherings, and, finally, death and mourning. I shall try to make this little work pleasant and for that reason I shall allow myself to insert an occasional fable which was formerly held to be a fact and which even today is taken as such in certain regions.

Word to the Reader

114 This little work, which some will call not only useless but also a waste of effort is now born, but perhaps others who like to study races will find it useful for Ethnography, despite the fact that it is inadequate to give a perfect idea of the race among which I have lived since the year 1893.

Before beginning this third work I have tried to acquire some knowledge. I am not the first to write about these Indians; I have been preceded by D'Orbigny, Pelleschi, /xiv/ Mantegazza,

/xiv cont./

114 the Franciscans Conrado, Cardús, Martarelli, Giannecchini, and Señor del Campano, etc. But in Bolivia no complete work is known, notes or pages by authors definitely worthy of every respect and very competent hardly exist, nor have explorers witnessed all that they have written about, from which have come errors which would certainly have been avoided if the reports had not been made so hastily.

121 [124] With all possible calm, patience, and unlimited time, I have set out to talk with the oldest and most knowledgeable Indians, who have explained some points to me, corrected certain others, and made me add still more; but I have already said that with my writing I do not pretend even to equal the luster of those who have preceded me. I shall only give more extension to the ideas which have been set forth by others, ideas which in the majority have been confirmed by the Indians to whom I have addressed myself.

Finally, I must state that since the Chiriguano are in contact with the mission Indians, and these, both old and new, exist in considerable number, I shall add by way of conclusion, after having finished what I have proposed to do, a chapter concerning the heathen Chiriguanos, the neophytes, or new Christians, and the method that the Missionaries use to reduce them religiously and civilly, and the effort required to maintain them in the Catholic faith.

121 128 Everyone will understand that, in order to avoid confusion, this small work will be divided into chapters, and the chapters into sections, for greater clarity and so as not to tire the reader. Certain terms that I must print here by necessity will be written in the Chiriguano language with their corresponding explanation, so that each one may understand the impact of the language. I could also formulate some general propositions with the corresponding Spanish, but the nature of this somewhat voluminous book does not permit it, nor is it necessary, because /xv/ there are various small handbooks which have been printed in this Republic of Bolivia.

/xv cont./

121 Lovers of Ethnography are asked to overlook as much as they can the faults that they will find; rather I pray that they will only note the facts which I set down with all candor and exuberance. With the remarks that precede I am going to begin.

San Buenaventura de Ivo, May 20, 1911.

Father Bernardino de Nino, Missionary, O. F. M.

114

Je prends mon bien partout
où je le trouve.

The Reverend Father de Nino, Franciscan Missionary of the Colegio de Propaganda Fide of Potosí, has honored me by charging me with the presentation to the public of the book which today sees the light, the preparation of which we have already announced in several numbers of the Boletín of the Repartición Nacional under our administration.

A very special reason compelled us to accept such a pleasant task: it provides for us, and for the scientific interest of the country, valuable collaborative material which is brought us by the learned Missionary whose intimate knowledge of the Chiriguano Indians, among whom he has lived as a catechist for many years, is indisputable.

There likewise weighed heavily upon our mind another powerful reason for welcoming the Etnografía Chiriguana with deserved applause: we had in mind the fact that in 1914, by an arrangement arrived at in London at the close of the sessions of the XVIII International Congress of Americanists it was decided that the meeting of the XIX was to be in Washington and this City of La Paz, as was done with the XVII, which held its sessions in commemoration of the Argentinian Centennial of 1810 in Buenos Aires, finishing in Mexico City.

We had to prepare ourselves for the session which was to be /xviii/ held in Bolivia, and this suggested to us the idea that the worthy work of the Reverend Father de Nino might be dedicated

/1/

Chapter One

Description

Introduction

• 121

When an historian or an ethnographer proposes to write the history or ethnography of a tribe or race, he must naturally begin with a description of the region occupied by the human beings who are for a greater or lesser time to occupy the writer's mind. The general description of the region is almost as necessary as the origin of the tribe, but during the course of the undertaking, whether it be large or small, it does not prevent the one who is burdened with the work from letting his preoccupied fantasies go from time to time andscatter hither and yon lilies and fragrant roses, whenever an unexpected opportunity to sketch a delightful panorama, like the one which unfolds before the traveler on the peak of Huacareta Hill and the one from Irenta Hill descending toward Cuevo, might present itself to him.

In my little work "La continuación de la Historia de Misiones del Colegio de Potosí," I said that in order to bring forth a chapter like the present one, one needed time, elucidation, an abundance of material, and tranquility of spirit, things or properties hard to find together in an obscure missionary like the one who is writing.

/2/ Could my readers perhaps believe that my situation could have changed in so short a time? If they do believe this, it is due to the goodness of their hearts, since the situation of he who writes, instead of improving, seems to have become aggravated. Nonetheless, unpretentiously, I am going to concern myself with a description of the Chiriguano region, only because by its nature the work requires it. In my previous one I never foresaw that I should write this third one, which will cost me a little work and time, because, I repeat, in order to write, tranquility is needed, and the Indians, with their continual grievances, do not allow this for a missionary, which leads to the diversity in style, smooth to harsh, lucid to obscure.

/2 cont./

●121 elegant or labored, natural or stilted, which can be observed in one book by a single author. But the fact is that I can only write it here, since only the Indians are able to smooth out the difficulties which naturally will arise in the course of these pages.

I am familiar with almost the entire region inhabited by the Chiriguano, with the exception of a few small areas, but this is of little importance, as much because they are not of historical importance as because I have obtained data about them which show them to be like the rest. It would even be easy to make a map of the region, but I am embarrassed to say that I am not competent to do this.

General View

133 The region which the Chiriguano Indians occupy today is composed of many little valleys /cañadas/ which run from north to south; they are separated by mountain ridges which vary in size, height, precipitous slopes, deep gorges, and incalculable depths. Its length is quite considerable, while its breadth is not over 180 kilometers. The mountains rise to 3,000 meters and more above sea level, but at that altitude there is no longer any vestige of forest, while at 1,200 meters the woods are exuberant.

In the midst of the valleys low hills cross in every direction, and there are some which from a distance look like larger hills or on their way to becoming such; others are completely isolated and quite small, but they attract the attention of the traveler because of their conical shape, like the traditional "Tunparepoti", located at the beginning of the pampas of Yvu. *There is no hill which does not make room* [262] upon its breast for a multitude of trees of every size and description, like a grove, and /3/ another multitude of vines like the bejuco and low-lying plants of the cactus family, which the Indian uses by eating their fruit, whose combined acridness and sweetness would make them please and be preferred by the most aristocratic lady of the city of Paris.

/63 cont./

439 191 them in the area around the place called Basilio, and they take them in cages to the Argentine Republic.

*136 TOUCAN. -- A very unusual bird because of its long beak, which is almost as long as its body. This beak is yellow, red, and black, but very light; otherwise, since it is so large, it would be difficult to hold up. One who for the *[825] first time sees a toucan, called "Tuaca" in Chiriguano, thinks that it is carrying an ear of maize in its beak. Toucans go in large flocks and have their favorite places; I know only [157] one variety of them. It is said that the beak, when ground up *[826] and taken in water, stops the flow of blood. It seems that the toucan only lives in hot climates. If it is taken to other places, it dies.

URRACA /magpie/. -- This flying creature is rather large and abundant. There are several species of them, [231] differentiated by their plumage. It is easily domesticated, and it is useful in the houses, because it kills all of the bugs or insects which multiply in them, but its size is no larger than that of the toucan. It is as restless and noisy in the houses as it is in the woods.

●121 I here put an end to this brief description of the land inhabited by the Chiriguano and what is contained therein. All will understand that I did not attempt to discover and describe minutely each and every one of the plants, each and every one of the quadrupeds, amphibians, and insects, each and every one of the birds, but only those which seemed to me to be of the most importance. If it seems to my readers to be too much, or too little, they will be so kind as to excuse my faults; meanwhile, I am going to begin the real ethography, which will be somewhat long so that it may be clearer and more pleasant. /*/ /Illustration appears here./

Chapter Four

Religion, Divinities, and Beliefs of the Chiriguano

/The introduction to this chapter, "An Illustrious Franciscan," pp. 126-127, is omitted in the translation./

/128/

Religion

121

It is beyond any doubt that all peoples profess some religion. This fact is proved by the testimony of all missionaries and confirmed by innumerable travelers of various nationalities and who profess different creeds.

But to the extent that religion implies external demonstrations of veneration, the variety of ways of worship is so great that it may well be stated that every people has its special way, proper and peculiar to it, in which it honors its divinities.

The most advanced peoples display in their respective demonstrations of worship all possible splendor. They have magnificent temples, priests, and a ceremonial which, if it is not always in conformity with the dictates of common sense, does tend, nevertheless, by its nature and form, to awaken in man a sense of veneration and respect for a superior being, represented by something which strikes the senses.

From this point of view it would not be too bold to state that the external worship of peoples in general is in direct proportion to their level of civilization and culture.

This explains why among savage people there can scarcely be discovered a single sign, a ceremony, which might be a sign of external demonstrations of worship. But in reality it does

/128 cont./

124 exist, even among savages, since it could be said that, just as there is no people without God, neither is there a people that does not show Him homage in some way.

971 124 As far as the Chiriguano are concerned, I have tried to find out with special care, constancy, and assiduousness what religion they profess and what type of worship they render to their divinities. But all my efforts have been in vain. This is no doubt due to their state of ignorance as a result of their savage life.

[115] I have asked the oldest men of the tribe about their religion, and I have only received vague and insufficient answers on every point, thus being unable to form any idea, even an approximate one, of the religion which they profess. It is beyond doubt true, 796 795 however, that the Chiriguano have some religion, since they recognize a superior being. They admit the immortality of the soul, rewards and punishments in the other life, and they preserve certain Biblical traditions which would have no explanation if they did not believe in a god and perhaps in the Jehovah of the Holy Bible, or God, Creator of all things (1).

[805 791 192]

1. The Chiriguano, like the Hebrews, count the months by moons, and they have other very similar customs. It is very notable that they also have some Hebrew words.

577 971 /129/ The Chiriguano must have a moral code, that is, natural law, perhaps augmented by some traditional precepts, since they admit rewards for the good and punishment for the bad.

The law, to the extent that it is imperative, comes from the same God, but only religion serves as its base, and this teaches men that it is an unavoidable duty to submit to the precepts of the Supreme Legislator, under penalty of falling into grave punishments conceived by Him.

From what has been said, it can be understood as a logical consequence that the Chiriguano do profess some religion, even though this might not be known.

/187 cont./

301 302 (199) buy in the stores, so active since the founding of the missions. The Chiriguano with his vigorous head of hair and his red Yapirunta /166/ walks very proudly and show off both things at feast: in the presence of his companions (1).

(199) (114) (121)

1. An interested party once said that the mission in Yuchis had no purpose because the Indians were civilized. I am sure that this is not true, because the explorer who wants to learn the old customs of the Indians can study them better there than anyone else today. There they wear long hair, the tembeta /lip plug/, and balaca, or band, from childhood.

291 294 285 To cover the head they do not all wear a hat. The latter is woven by them themselves with palm leaves. Carandaiti they bring them from the places where they are abundant. Carandaiti, pull out the whitest shoots /cogollos/, take them to their houses, then string them one by one on a long cord, which they make of the same palm, tying them to each other. They hang them there and the action of the air whitens them much more. Then they divide each leaf of three or four shoots into leaflets no longer than 2 1/2 centimeters and begin to weave at the crown, where they form a cross with these leaflets, which they then keep weaving, and, as one ends, they add another, and when the work reaches the edge or brim, they stick the ends in so that the hat will not come undone, pull strongly, cut off the ends, and a round hat has been finished.

Others form long strands one centimeter wide and sew them to one another with cotton thread, and these hats are imperfect 292 564 cones lined with black or red cloth. They are used by old Indians, those of importance, caciques and sorcerers (7).

291 302 304 176

2. The Cuchua /Quechua/ always with his cap, the Chiriguano is abandoning the custom of long hair, the lip is pierced for the tembeta in few places now, and the straw hat is being

/312 cont./

the race can endure for a longer time. The same is true, if, instead of forts, the Government, at less expense, were to found missions in the places which are being explored at the present time; useful hands would be obtained for commerce and for agriculture, without the destruction of the poor humanity.

I finish by giving thanks to the Divine Providence which has brought about here the civilization of the race, utilizing for this purpose its simple and humble subjects, such as the sons of Francis of Assisi, who came to this New World immediately after it was discovered.

To those readers who have followed me benevolently and to those who have charitably criticized my poor writing, I give my sincere thanks and at the same time pray that they will deign to pardon such errors as they might find. Leon Deo.

End of the Work

/Illustration appears here./

/313/ Appendix

121 126

The time and place do not now permit me to draw a map of the entire region that I have described in the first chapter of this ethnography; nor do they permit me to write clearly about the other tribes which populate the eastern part of the Bolivian Chaco, which has recently been explored (1).

1. I believed that a map was indispensable for the "Guide to the Chaco." I drew it recently, and it is soon to be published at the expense of the Supreme Government. I may perhaps get an extra run of 1,000 copies for the present work.

C /313 cont./
121
122 If the Supreme Government and the friends who have helped me in this first edition continue to provide me with their considerable support, I plan to return to the region, to make better studies, to get certain data about the other tribes, to get views and panoramas with photographic cameras, and then bring out a second, more polished edition.

C
131
[114] Since, however, through my nomination as a Corresponding Member of the Geographical Society of this city of La Paz, I am making studies appropriate to this science, I shall set down in these pages the approximate geographical degree occupied by the known tribes which populate the extensive zone of the Bolivian Chaco.

The Chiriguano Indians are numerous from 18° 50' to 22° latitude south of the Paris meridian and from 65° to 66° 50' west longitude. However, small groups can be found at 17° 30' latitude and other groups at 22° 35' toward the south of present-day Yacuiba (2).

2. I follow the Paris meridian in placing the tribes because in the body of the work I have used the same to indicate the location of the Cayuguari Indians.

C
121 /314/ The reader who has accompanied me as far as these lines will have quite a clear idea of the Chiriguano Indians, their language, customs, and beliefs, and consequently I have nothing to add with regard to them, because this would be a repetition of what I have said. I shall say something about the others, so that Bolivians and foreigners may know the Indians with whom they are to deal.

Tapúi or Isoseños

Ce
161
131 The Tapúi Indians are as many as 2,000 between children and adults; they occupy both banks of the Parapiti River at 19° and 19° 50' latitude and 62° 30' to 65° longitude from the Paris meridian.

Indians in the years 1908, 1909 and 1913, and spent in all 4 to 5 months studying them. In my book »Indianlif» I gave a popular account of them as I got to know them during the Hernmarck expedition in 1908 and 1909. In my last book of travel »Forskningar och äventyr i Sydamerika» there is some information about the Chiriguano. I have brought home to Sweden from the Chiriguano and Chané about 1500 articles which are now in the Riksmuseum at Stockholm and in the Gothenburg Museum. In the Geographical Review I wrote a short article on the migrations of the Chiriguano Indians.

C
Ce
[126]

C
Ce
12
114

A close study of the Chiriguano and Chané civilization by the ethno-geographical method affords points of especial interest, since their mode of life is rather well known, and we are able to trace their history back to the beginning of the 16th century. I have also collected archaeological material from their region. At first I was minded to give an account of this, too, in the present work. I decided, however, that it would be better here only to mention individual finds by the way, and to leave the archaeological material for another publication in which I shall be able also to publish certain archaeological finds made in other parts of Bolivia. This for purely practical reasons.

C
Ce
121

I will here endeavour to make clear how the Guarani-speaking Chiriguano's and the Guaranized Chanés' civilization are composed, what culture-elements they have got from the Whites and from the Mountain civilization in the west, what each brought to the common stock and what they possibly obtained from other quarters.

In this analysis of Chiriguano and Chané manners and customs, I do not intend properly to examine the question as to whence these Indians came to their present abodes. Broadly speaking we know that already. Respecting the Chiriguano migrations there are historical documents extant which evidently show that it was not until the beginning of the 16th century that these Indians conquered

the tracts they now occupy.[1]) [2]) They drove out or subjugated the original population, which consisted chiefly of Chané Indians. They made slaves of a great number of them and ravished a great number of women.

The Chané are, as was mentioned, Arawaks and all indications point to their having come from the north or north-east, where they have large numbers of kinsfolk. It will be found that the present investigation confirms this. A matter of particular interest in this connection is to notice how two peoples belonging to the most important groups of tribes in all America made adoptations in their mode of life when they had emigrated to places with strange natural conditions. Again, it is worthy of note how their civilization was transformed und the influence of the Bronze-age civilization in the west and afterwards under the influence of the Whites. Further we shall see what they have, under their new conditions, been able to preserve of their original civilization. We shall gain insight into the way in which the civilization of two Indian tribes was transformed under the influence of other peoples and new natural conditions.

Ce 121

As in Part I, I deal chiefly with the «material» side of these Indians' life. Or rather, everything in their life which

[1]) NORDENSKIÖLD (13).

[2]) MEANS, basing his opinion on GARCILASSO and MONTESINOS, has assumed that the Chiriguano invaded the Inca Realm earlier than the beginning of the 16th century. But even if his assumption is correct, these inroads led to no domiciliation there. This is evident from the accounts of the invasion in the 16th century, when the Chiriguano supplanted, what was everywhere an original stock. Nor do we know whether by Chiriguano the Incas did not mean barbaric tribes of the Chaco in general, and not any particular tribe. In these parts Chiriguano probably corresponded to the signification that Chunchos had in the district of Cuzco, where it meant all sorts of barbaric Indian tribes east of the Andes. The Chiriguano that GARCILASSO DE LA VEGA AND MONTESINOS speak of need by no means have been Guarani Indians. I have already pointed out (NORDENSKIÖLD 13) that GARCILASSO's description of the Chiriguano is absolutely irresponsible.

can be kept in a museum or for which one may find — given favourable circumstances — archeaological comparative material. Besides weapons, ornaments etc there is thus included also burial customs, tatooing, dancing-masks, etc.

C
CE
128

The reader will find that I have endeavoured to make this part more graphic than Part I . From the maps of bibliography it will be seen regarding what regions I have had access to literature; it can also, in some measure, be seen whether the blanks on the maps are due to those particular tribes never having been closely studied.

The maps of distributions in this work are fewer in number than in Part I. This is because we find the Chiriguano and Chané, or one of these tribes, on twenty-nine maps in Part I. Part I is largely preparatory to Part II. Parts I and 2 together contain 45 maps showing the distribution of culture-elements occuring among the Chané and (or) Chiriguano.

C
CE
121

All who are interested in the ethnography of S. America will, I venture to think, find the maps worth close study and will see that from them various deductions can be made not only respecting the Chiriguano and Chané Indians but also as to the ethnography of S. America in general. In some measure I have, indeed, endeavoured to do this myself.

C
CE
131

The land of the Chiriguano and Chané the Indians streches from near Sta Cruz de la Sierra to near Rio Bermejo. Southwards of Sta Cruz the territory inhabited by the Chiriguano is continuous. The Chané, on the other hand, live in several different quarters, some at the river Itiyuro in the Argentine, some at Caipipendi near the Rio Pilcomayo, some at the Lower Rio Parapiti, and others near Itau south of the Rio Pilcomayo. The neighbours of the Chiriguano and Chané are the Mataco-Vejos, Mestizos, and Whites to the south, the Matacq, Toba, Tapiete, (Yanaygua) and Tsirakua to the east, to the north Mestizos and Whites, and to the west Quichua, Mestizos, and Whites.

Resumé.

C
Ce
121
177

In the foregoing pages I have attempted to analyse the material culture of the Chiriguano and Chané, and have tried to show from where they have derived the cultural elements existent among them. Finally I will see to what extent conclusions can be drawn from what has been said above, as to the changes the material culture of these Indian tribes has undergone under the influence of an entirely strange culture — that of the Whites — and of a kindred culture — that of the bronze age in the west. Furthermore, we will see what the Chiriguano and Chané have kept of the culture they had before they migrated to the districts they now inhabit, in what measure they have adapted themselves to their new natural surroundings, and what they presumably have learnt from their neighbours the Chorotí, Toba, Mataco and Tapiete.

C
Ce
128
177

I have shown in tabular form the cultural elements the Chiriguano and Chané received from the Whites, those they received from the Mountain culture, and those that derive from the north and the east. This third table embraces such cultural elements as the Chiriguano and Chané took with them when they migrated to their present habitat. In the tables I have mentioned, as the reader will see, in the case of each cultural element whether its distribution in the region examined is favoured by natural surroundings, whether in its distribution it is in general independent of such surroundings, whether it is of great importance in the struggle for existence, whether its manufacture calls for technical skill, whether it is man's or woman's work, whether it is used by men or women or both, or only by children, whether it may be looked upon as still frequently used or as disappearing, and whether it can be regarded as a

C Ce 834 171

/225 cont./

Nevertheless, if in the evening one sat beside the fire in the hut and was acquainted with the family, they seemed to be quite free and easy. The Choroti and Ashluslay men are very shameless. The men among the Chané and Chiriguano, on the other hand, less so. It is very common for the Chiriguano and Chané women, conversing in a group, to pass water standing up and to let the urine run down their legs, which may be regarded as less than clean. The men, on the other hand, always step aside in order to relieve themselves.

C Ce [574]

C Ce 833 171 834

/226/ As has been mentioned, the sexual act among the Ashluslay often takes place in the presence of onlookers. At the Choroti /Fig. 114 appears here/ dances one had to be careful in the darkness not to stumble over the loving couples. One never sees anything like that among the Chiriguano or Chané. Since many /227/ are lying in the same hut, however, one sees even among them what one always sees if one has overnight guests. This is not the least reason why the sexual life has no secrets even for small children.

C Ce 834 177 577

Apparently life with the whites heightens the sense of modesty. The Indian women are even embarrassed to expose their breasts. Morality declines in proportion as the sense of modesty grows.

This should be taken into consideration by all those who sew clothing for naked heathen children.

Ce ●121

Many of my readers may perhaps feel that this chapter should not have been included in my book. Nevertheless, it seems to me proper to say something about deviations in the sexual sphere. It contributes to an understanding of the people whom I am describing here. I have, of course, not been able to speak about all the realism that came out in the conversations around the camp fire (1).

1. If our daily papers, which are meant for the public, write about all kinds of things, one need not be too prudish in a travel account.

C 114 /2 cont./ outside of the Toba, whom I met only in passing, I got to know on this journey the Chiriguano and the Izozó, who, like the former, speak a dialect of the Guaraní language; the Tapieté, Churupí, Mataco, and Chorote. All of these Indian tribes are not unknown in ethnological literature. On Chiriguano history we are oriented through old documents from even the first years of the Spanish conquest, and we owe to the Franciscan missionaries, who have taught among them for a long time, quite important ethnological publications. The Churupí have been studied minutely under the name Ashluslay by Erland Nordenskiöld, and the Oblates of Immaculate Mary in Esteros and Lake Escalante are striving intensively to make ethnological investigations. I have proposed to deal with all of these tribes systematically. This survey will be made on the basis of the results of my journey, and I begin in this first publication with the Chiriguano and Izozó.

General Information

C CC 114 361 As I said in the introduction to this work, I first met the Chiriguano in Machareti and the Izozó in the area around the fort of Toledo and in the fort "15 de Agosto," several kilometers from the former two.

C 361 [632] [797] Figure 1[1] presents a view of Machareti, a Chiriguano town created in its present form by the Franciscan mission. When the Paraguayan army retook Machareti, it had already been abandoned by the Padres, and now a Chiriguano, in the role of commissioner /comisario/, is the chief of the town, there also being a few caciques. The houses, more or less in the form of modern ranchos (cf. Figs. 14 and 15 /see p.40 /), are on both sides of wide streets which run parallel and at right angles, as in most of the towns of the former Spanish colonies. When I was present in Machareti, there was great need /3/ among these Indians because of the severe drought which had ruined their plantings, which were some distance from the town. At the side of the ranchos are often found deposits which were structures of native houses built on sticks. Although

different categories depending on whether they received them from the whites, from the culture of the ancient Peruvians, or from the Mataco, Toba, and other tribes of the Chaco, or have them in common with the tribes of the north and the east related to them, as well as those that they brought with them from their primordial homes between the Paraná River and the Paraguay River. In what follows we shall often run into this matter, and inasmuch as these cultural influences have taken place in historical times and we know the history of the Chiriguano through existing documents dating from the first days of the Spanish conquest, I would like to make a resumé of these historical data in what follows, insofar as they have influenced the cultural development of the Chiriguano and Chané.

In one of my previous publications which appeared in this journal, entitled "Los Guarayú," I ran into the point at issue, to wit: whether the first Guaraní immigration into the western regions of the Paraguayan Chaco took place before the expedition of the Portuguese Alejo García to Peru or whether it took place after that time. In that paper I then deduced that it can be supposed that before Alejo García's expedition there were no Guaraní in the western regions of the Paraguayan Chaco, because no author mentions that García, who was accompanied by many Guaraní, had met other Guaraní in those regions. With this opinion that the Guaraní immigration to the west occurred after García's expedition, which is based principally on indications by Guzmán, the opinions of Manuel Domínguez and Erland Nordenskiöld also agree. This question of the Guaraní invasion into the western part of the Paraguayan Chaco is also dealt with in detail by Fulgencio R. Moreno in his work Cuestión de límites con Bolivia (3). In that place (4) there

/297 cont./

121 114 Father Bernardino de Nino, it is only a translation of Campana's article, filled out with copious borrowings from Corrado's work. Nevertheless the Reverend Father Bernardino de Nino added many very interesting details to the texts that he reproduces, which make consultation of his Etnografía chiriguana indispensable.

121 126 My aim was to complete the work of my predecessors and to get together for the Museum of Tucumán a collection which would be truly representative of the last of the cultures which formerly flourished within the limits of the old gobernación of Tucumán. My Chiriguano collections, along with those collected by Nordenskiöld, are, I believe, the most complete ones from this region that exist in the world. They bear witness, I hope, to the richness of this area from an ethnographic point of view, a richness which has been left unexploited and which will disappear in a few years.

121 May these pages demonstrate that every culture is a whole complex, so varied, that no ethnographer can study all its details in the course of a single trip. It is not useless to go back where others have preceded you, for, whatever their merits may have been, the material cannot be exhausted in one time.

● 122 There remains the paying of a debt of gratitude by thanking Doctor J. B. Terán and Doctor J. Heller, who, as rector and vice-rector of the University of Tucumán, gave me the means to bring about this trip. The new rector of the University, Doctor J. Prebisch, granted me the sizable funds which publication of the results of this expedition required and supported constantly the Revue d'Ethnologie of my Institute. I am eager to make known to him here how grateful I am.

114 122 I wish to express my thanks again to all those who helped me in the course of my trips first and foremost the Franciscan missionaries who gave me generous hospitality and helped me as much as possible; my debt is particularly great to the Reverend Father Jocundo Ferrari, thanks to whom I was able to carry out without damage the transportation of my collections from the upper Pilcomayo to Cuevo; to Father Angrisani who received me so frequently in his Ivu mission. Neither do I wish to forget Fathers

/297 cont./

122 114 Luis Mattioli, Dionisio Polvorini, Juan Nicolai, and Honorato Catinari, who backed me up on various occasions. The Reverend Father Enrique Biagini did me a service for which I was very grateful by committing me to the care of all the missionaries of the Chaco.

The prefect of Tarija, Colonel Nuñez del Prado, facilitated my trip /298/ by giving me a safe-conduct which was particularly useful to me in dealing with the authorities of eastern Bolivia. This man, courteous and intelligent, has just died on the battlefield. I wish to salute his memory with gratitude.

My compatriots Messrs. Burry helped me during my whole trip and rendered invaluable services which I remember gratefully, as well as the important aid given me by Messrs. Attié of Tarija.

I received cordial hospitality from Mr. Bonardi of Ñancarwinna and from Mr. Vicente Constantini, whom I thank here.

Mr. Alberto Torrejón of Ibopeyti showed himself to be a host full of intelligence, and his intervention on my behalf with the Indians was very useful to me.

114 123 I should show myself ungrateful and unjust if I did not here express all I owe to the Indians themselves, whose reception, once the first mistrust was dissipated, was always so cordial, so generous. Here I should like to cite the name of my old friend, Captain Karnapadyú, of Carurutí, who was a courteous and kind friend to me and who made my stay in the Caipipendí valley so pleasant. Some day may I come back to my Chiriguano friends with mules loaded with knives, cloth, and beads, and thus fulfill the wishes they expressed so often to me.

/356 cont./

252 no preparation other than constant stirring in order not to be burned. This food takes the place of bread for the Chiriguano, who like to munch these crunchy and appetizing kernels. They provide themselves with it when they go on a trip.

Atipũi pounded in a mortar and passed through a sieve gives atši, a brownish flour which has an excellent taste. Atši is also prepared differently: kernels of corn are reduced to a flour which is roasted in a terra-cotta roaster or in a wide potsherd. According to Nino (p. 246), the name atikũi would be given to the kernels of roasted corn made into flour after being put through a sieve and ground until pulverized. The same missionary reserves the term atši for roasted flour obtained from the residue left by kernels which have been treated in the following way: after letting them soak in water all night, they are poured into a sieve the next morning. When the water has drained off, they are pounded in a mortar. This flour is now sifted, then roasted; cooked in water, it is the dish the Chiriguano call muintí or huinti. Atši then would be made with the residue from the muinti flour, which is ground again, then roasted like it, but first mixed with salt or pimento. I
[122] have often eaten roasted corn flour which the Indians told me was atši, but I could never tell that it was seasoned. The Chiriguano give the name abatikure to the corn bran.

This is how muintimimo is prepared: kernels of corn are /Plate XIII appears here/ /357/ put to soak all night. The next morning they are ground and sifted in an urumpé (sieve with very fine mesh). The flour is poured into a muitero
[115] (Plate XIII, 1 and 2). This utensil is a terra-cotta basin whose bottom is pierced with holes like a skimmer (1). The flour is

[113] [114]

1. Linné (2, Map 1, p. 23) has given us the distribution of vessels with perforated bottoms throughout America. The enumeration he makes of them is very complete; yet it lacks mention of La Rioja in the Argentine Republic where Boman (5, p. 17) discovered fragments of vessels whose bases were entirely perforated like a sieve.

[Text continues on p. 104]

/364 cont./

Fermented Beverages

293 Anyone who has traveled among the Chiriguano or the Chané has learned to prize corn beer, or kĩwi. Few moments in the course of my expedition have left me more pleasant memories than the ones when, tired by a long stage, I would sit down in front of a hut and receive from the hands of the wife of the "captain" a calabash full of this liquid, slightly sharp and a little granular, which quenches thirst and allays hunger. The day when the Chiriguano stop making kĩwi will be a sign that they have disappeared from the face of the earth, and perhaps this delicious drink will survive them as a creole speciality in which good nationalists will take pride.

[122] [123]

Father Corrado (p. 43) once heard from the mouth of a Chiriguano an admirable definition of the role of kĩwi in the life of an Indian: "It is our father and our mother," said he. Indeed, it is the father of joy, the sign of plenty, the companion of the most beautiful moments of existence as well as the most tragic ones. It has within it a mysterious and mystic force which penetrates the individual, exalts him, and protects him against supernatural dangers. All festivals are reduced, in their essential part, to the consumption of kĩwi; no collective enterprise is conceivable without their first drinking it from full jars (1). From birth to death, all that affects the

293 726

1. Even in the 18th century the Chiriguano, like the ancient Tupinambá, did not undertake any expedition of war without having celebrated a caouin or a vin /wine/, to express ourselves like the old French chroniclers; /a passage of poetry in Spanish from Barco Centenera, p. 262, is omitted in the translation/.

When the Chiriguano of Parapití and Caipipendí rose up in 1799, before the revolt they held great drinking festivals, during the course of which they decided on the plan of operations (Corrado, p. 254).

/462 cont./

Chapter X

Masks

532 796 [122] The handsome masks, whose description I shall give further on, are worn during the carnival festivities. Difficulties with the Bolivian authorities kept me from arriving in the Chiriguano villages at the time when they were taking place. When I finally found myself among my Chiriguano friends, they had emptied the last vats of kĩwi and were /463/ in their [126] normal state. Thanks to the closeness of the feast I was able [241] to collect the masks published here; ordinarily they are destroyed or used in the fields as scarecrows.

115 My host, Mr. Alberto Torrejon, who lives at Ibopeytí on the upper Pilcomayo in an Indian village, gave me some very interesting details about the ceremonies and merrymaking in which he had just participated. I transcribe them as given.

796 At my approach of any festival, the carnival, for exam- 795 ple, the first act consists in causing the souls of the dead to flee. 789 If this precaution is not taken, the widows and relatives of the deceased will have to abstain from taking part. For the purpose of purifying the air, a drum is beaten, and the whole family /Fig. 120 appears here/ which has lost a member weeps and shouts. When the spirits have cleared out, the drum, in a joyful rhythm, gives the signal for merrymaking.

796 The festival is opened by a man and a woman who, with a stick decorated with flowers in hand, advance toward the middle of the square, followed by all the inhabitants in a long chain. When they have arrived at the middle of the area extending between the huts, the couple plants this sign, thus giving the signal for the festival.

[535] The chain breaks up and small groups form to dance in a ring. Their dance consists in advancing and retreating in triple time to the sound of flutes and drums.

Chapter XIV

The Treatment of Illnesses

Sorcerers and Remedies

756 178 Sorcerers. Medicine men have become so rare among the Chiriguano that I could not get to know a one during my whole [123] trip. Only on the upper Pilcomayo did they allude in front of me to a talented paye who lived in a nearby village.

Although great sorcerers endowed with supernatural powers and surrounded with great prestige no longer exist, there still must be in each village a man or woman capable of curing certain illnesses and of pronouncing incantations.

A scene I witnessed at Timboy (Salado River, upper Pilcomayo) demonstrates well that the profession of sorcerer, less important though it may be, has nevertheless not disappeared. [122] I was living in the home of a Bolivian half-breed whose child's body was covered with purulent pimples. His parents began by appealing to my medical knowledge, but I declared myself incompetent to treat this case or any other. They then 75 called an old Indian woman, who appeared one morning with [824] a plant in her hand, a kind of wild pumpkin which the half-breeds call sandía del monte. This plant, crushed and mixed with hot water, is used for external washing. They stretched the child out on the ground and commanded him to hold himself motionless. The old woman sat down near him and began to mutter inaudible incantations which she interrupted only to spit often on the limbs of the little patient. Then she would take up her recitation again, at the same time spreading the saliva over his body from head to feet. Nordenskiöld (3, p. 44,

/v/

Homage that the author presents to the XIX International Congress of Americanists, which is to meet in this city of La Paz in the year 1914. /Page ii is blank. Page iii is omitted in the translation./

/vi/ Author's Acknowledgement to the Supreme Government of Bolivia

Gratitude is a virtue by means of which the blessings received on this earth are acknowledged: it is natural and supernatural: the former is based in nature and the latter in a divine principle through which a grateful person becomes worthy of even eternal blessings.

The ingrate becomes an abomination before humanity and before God: thus does he show us the bitterness that Jesus, the man-God, felt when He received the affront of Judas, who had received so many blessings from his Divine Master.

Does the world ever lack persons who in times of tribulation, troubles, and unhappiness will come to others for consolation, declaring themselves to be friends and later, their ends gained, will turn against some, gossiping about their benefactors and accusing them of what is not so, because their perverse eye makes them see white black and black white? There is no lack of these, and the history of the Nations provides us with innumerable examples of this.

Religion cannot do anything but reprove ingratitude and approve the opposite virtue, from which it is necessary to deduce that the Christian, who professes the true one, ought to show his gratitude to those who do him a favor.

/vii/ I began this work, which will soon be printed, with the expectation of being assisted in its publication by the present Mandatary Most Excellent President of Bolivia, the Eminent Doctor don Eliodoro Villazón, who encouraged me to do it by letter in 1908. And my expectations have been fulfilled.

/in cont./

122 In fact, at the beginning of this year 1912 I had occasion to address myself to the Most Excellent President, to the Ministers of Instruction, Finance, and Colonization, Messrs. M. B. Macias /y/, Carlos Tamayo, and Julio La-Faye, with the assistance of the Chancellor of the University of Potosí, Dr. don Nestor D. Mendoza and the Supreme Government, which so highly esteems scientific works, has decided to have my work printed at its expense in the print shops of La Paz.

This eminently patriotic and national act greatly honors the Most Excellent President and his illustrious Cabinet, and places a great debt of gratitude on the author of Etnografía Chiriguana, which was completed in the same region that it describes.

By means of these few lines, then, the undersigned shows his deep gratitude to the Supreme Government of Bolivia for the consideration with which he has been honored, the publication of his work having been accepted in the manner set forth in the communication which I reproduce literally, as follows: "Ministry of War and Colonization -- Bolivia -- Department of Colonization -- Nos. 410 -- La Paz, February 23, 1912. -- To Reverend Father Bernardino de Sinn. -- Potosí. Sir: In reply to your kind letter of January 11, together with which you have been so kind as to send me a copy of the proposal brought before the Supreme Government, for the publication of a work prepared by you on the eastern region of the Republic and the ethnography of the races who people it, I am obliged to inform you that the lack of funds available in the National Budget for such purposes prevents us from accepting the first part of the proposal you suggest, the second being more feasible, in accordance with which the Government can recommend the publication of your work in the War Administration of this city, which has the necessary means; in which case you will have the right to the 500 copies which you request, with the intellectual rights to the work being reserved.

/v cont./

122 "Your proposal thus having been accepted in one of the proposed forms, I trust that you will be so kind as to send /vi/ the respective original copies to this Ministry with such instructions and documentation as may be necessary for the purpose already indicated.

"With this in mind I greet you and repeat that I am your obedient and humble servant. --For the Minister, José Lavadenz, Deputy Secretary of Colonization."

Although in the preceding original letter only the Minister of War is represented, other official communications which I have in hand show that the Most Excellent President and his Cabinet took an active interest in the publication of my work, for which reason my gratitude for this extraordinary favor is addressed especially to the Most Excellent Señor Villazón first of all and then to the Honorable Ministers.

Potosí, March 15, 1912.

Father Bernardino de Nino.

Note. -- For justifiable reasons, instead of having the publication of the present work done in the War Administration, it is being done in another location, for which the Supreme Government looked favorably upon my petition that they help me with the amount of 2,000 bolivianos, which I have already received, with myself being obliged to deliver to the Minister of War 250 copies of the work when the publication is completed. /Page vii is omitted in the translation. Page viii is blank./

C /212 cont./
121
•122 If the Supreme Government and the friends who have helped me in this first edition continue to provide me with their considerable support, I plan to return to the region, to make better studies, to get certain data about the other tribes, to get views and panoramas with photographic cameras, and then bring out a second, more polished edition.

C
131
[114] Since, however, through my nomination as a Corresponding Member of the Geographical Society of this city of La Paz, I am making studies appropriate to this science, I shall set down in these pages the approximate geographical degree occupied by the known tribes which populate the extensive zone of the Bolivian Chaco.

The Chiriguano Indians are numerous from 18° 50' to 22° latitude south of the Paris meridian and from 65° to 68° 50' west longitude. However, small groups can be found at 17° 20' latitude and other groups at 22° 25' toward the south of present-day Tacuiba (2).

2. I follow the Paris meridian in placing the tribes because in the body of the work I have used the same to indicate the location of the Cayuguari Indians.

C
121 /214/ The reader who has accompanied me as far as these lines will have quite a clear idea of the Chiriguano Indians, their language, customs, and beliefs, and consequently I have nothing to add with regard to them, because this would be a repetition of what I have said. I shall say something about the others, so that Bolivians and foreigners may know the Indians with whom they are to deal.

Tapiú or Iowaiha

Ce
161
131 The Tapiú Indians are as many as 2,000 between children and adults; they occupy both banks of the Parapiti River at 19° and 19° 50' latitude and 62° 20' to 65° longitude from the Paris meridian.

/920 cont./

They devote themselves to planting, hunting, fishing, and raising livestock; they rarely go on maue to Chiriguano towns and even more rarely to those of the whites, to which they do little damage.

Miscellany

C
824
829
757

In the section "Flora" in Etnografía Chiriguana /Chiriguano Ethnography/ I described the passion flower of the Chaco region of Bolivia, which is called granadilla de monte /wild passion flower/ there. Its roots are medicinal and those with pretensions of being doctors there employ them to cure tapeworm.

There is a small tree called "Nuranti mburu," long thorn, by the Chiriguano, and melocrillo /small melon/ by the whites of Santa Cruz. It grows three or four meters high at most; when it blooms, its tips are a quite light purple; its roots are put on to boil for a period of one and a half hours, and the clarified water is an effective remedy for treating dysentery.

C
122

The Franciscan school /colegio/ at Pomé, the Reverend Father Prefect of Missions, and the Padres Convertos of the same school deferred to my suggestion that they /924/ help me in publishing the Etnografía Chiriguana, for which I thank each and every one of them from the bottom of my heart.

I extend in these pages the same thanks to a group of gentlemen from the city of Sucre, who, encouraged by Doctor Don Tomás Arana, assisted in the publication with a subscription of ten bolivianos per copy.

Finally, special thanks have been earned by two young ladies from the city of Sucre and another from the city of Oruro, who, through special deference to the author, have favored him with extraordinary alms, without imposing upon him any obligation whatsoever.

PREFACE

C
Ce
D2

As I mentioned in the preface to the First Part of this work, the expenses of publication have been defrayed by Consul-General Axel Axson Johnson, Esq., of Stockholm, to whom I have taken the liberty of dedicating this, the second part of my book, as a small token of my appreciation of the interest and kindness he has shown towards my South American researches. I also mentioned in the earlier preface that Consul-General Johnson has in every way tried to further Swedish researches in S. America, above all by granting free passages to all the Swedish explorers visiting that continent on board his comfortable and stately ships.

C
Cc
F6
F7
Ce
D2

This work is based on collections made by me in S. America, as well as on the study of material in museums and of books (See Part I). I would remind my readers that these researches have been carried out with the support of Swedish patrons of research-work, notably Arvid Hovgaard, Esq., and Mrs. Ina Smitt.

610

I have to thank several of my friends and colleagues for valuable communications, which I have made use of in one way or another in the present work. These are: Mr. Kaj Birket-Smith of the National Museum, Copenhagen (M. C.), Dr. G. Friederici, Dr. R. Karsten, Prof. Dr. Th. Koch-Grünberg, Director of the Ethnological Museum, Stuttgart, Dr. F. Krause, Ethnological Museum, Leipzic, Dr. J. P. B. de Josselin de Jong, Royal Ethnographical Museum, Leiden, Licentiate Sven Lovén, Prof. Dr. Max Schmidt, Ethnological Museum, Berlin, (M. f. V. B.) and Dr. Max Uhle. Every possible courtesy has been shown me by the Riksmuseum,

C /176 cont./

Fig. 83. Hearth for boiling maize beer. Chané village. Rio Itiyuro. To the right in the picture, large vessels in which the maize beer ferments. The house is plastered with earth.

C
Ce I have slept in these huts many a night. They are, as a
342 rule, free of vermin, which cannot be said of the dwellings
122 of all other Indians and of the houses of the whites. The sleep-
136 ing place either consists of a bed made of a species of bamboo
352 cane, or one lies /Plate 16 appears here/ /177/ on the ground
513 on a reed mat or a skin. One also sees hammocks in the huts.

Ee 622 643 354

/230 cont./

The chiefs' families form a sort of aristocracy among the Chiriguano and Chané. Several times I heard Indians boast about their good family connections. A Chiriguano who accompanied me for some time as an interpreter was eager to impress upon me that he was related to the most famous high chiefs.

Just as the author of this book is customarily introduced as the son of Adolf Nordenskiöld, so the Indians were wont to introduce in similar fashion the sons of their "great men."

I even discovered a bit of deception in connection with the family tree. A Chané claimed direct descent from the great Hinu Parava, which, however, is said to be untrue.

If one wishes to find beautiful things from olden times among these Indians, one must first look for them in the chiefs' families. They keep the old treasures.

Ee [177]

More and more the white authorities are beginning to appoint the chiefs. Thus, in one region one can find a chief supported by the whites and a legitimate one.

Ee 622 423 122 643

The chiefs have great power, and, as far as I could see, they are always obeyed, in contrast to conditions among the Choroti and Ashluslay. They own the land (at least in certain regions), not for themselves, but for the tribe. If one needs porters in a Chané or Chiriguano village, one gets them from the chief, and no Indian will refuse to carry out the orders of the chief.

Ee 622 643

Although the chief has such great influence, /231/ he nevertheless works in the same way as the other Indians. Vocapoy himself, for example, carried home the heavy wood for cooking the maize beer, and his wife had to cook and sweep, like the other women. Following the example of the whites, however, a few of the most civilized and wealthy Indians, such as Taco, now have servants from their own tribe, but this was not done originally. On the other hand, as I have mentioned elsewhere, it is not unusual for the Mataco-Vejos and the Tapiete to work for the Chiriguano and Chané.

Ee [359] [177]

Ee 177 464

Ee 622 643 431 123

When we came home to Vocapoy's village from hunting and shared our booty with the chief /Fig. 115 appears here/, his wife accepted everything, but then went around to the houses and gave her neighbors everything that she had received.

000 the Sociedad Científica del Paraguay. Having also visited
C the Churupí Indians at the mission near Lake Escalante, about
A 25 kilometers from the mission at Esteros, I continued my
M 114 journey on September 5 as far as Linares, where I found a num-
M ber of Mataco Indians, who in part lived in a town some seven
[361] kilometers from Linares and in part had come from the other
side of the Pilcomayo River to Linares.

C /2/ On September 9 I left Linares and on the next day
A arrived in Guachalla, from where I visited the Churupí camp
114 /tolderia/ about seven kilometers away.
A
[361] On September 11 I left Guachalla for the fort of Cururenda,
C where I had the occasion to see the Chorote /Choroti/ Indians,
CI who were living in a camp some three kilometers from
114 Cururenda, as well as some Toba and Mataco, who came
CI from the other side of the Pilcomayo to Cururenda.
[361]

C On September 15 I continued my journey as far as Oruro,
T in the environs of which I visited the Tapieté. My escort,
114 Lieutenant Cabello, who knew these Indians well, took me to
T their two camps, one of which is 15 and the other 32 kilo-
[361] meters from Oruro.

C On September 19 I left Oruro, and passing through
114 Capirendá and Carandayty, in the company of Lieutenant
Diego Corvalan, I arrived in Machareti, where I remained
from September 21-25. Since Machareti is a Chiriguano
town, I had a good chance at this place and at the end of my
journey, to observe this interesting Indian tribe.

Beginning my return on September 25, I passed in succes-
sion through Capirendá, Carandayty, López de Filippis, and
Puerto Casado, arriving in Asunción on October 8.

C Thanks to the great help of the military authorities, it was
[122] possible for me to pass through large areas of the Paraguayan
Chaco during the relatively short time of two months, to get
acquainted with a large number of native tribes of the Chaco,
to take photographs of these tribes, and to make up vocabularies
000 of their different languages. Outside of the Toba, whom I met

/297 cont./

122 114 Luis Mattioli, Dionisio Polvorini, Juan Nicolai, and Honorato Catinari, who backed me up on various occasions. The Reverend Father Enrique Biagini did me a service for which I was very grateful by committing me to the care of all the missionaries of the Chaco.

The prefect of Tarija, Colonel Nuñez del Prado, facilitated my trip /298/ by giving me a safe-conduct which was particularly useful to me in dealing with the authorities of eastern Bolivia. This man, courteous and intelligent, has just died on the battlefield. I wish to salute his memory with gratitude.

My compatriots Messrs. Burry helped me during my whole trip and rendered invaluable services which I remember gratefully, as well as the important aid given me by Messrs. Attié of Tarija.

I received cordial hospitality from Mr. Bonardi of Nancarwinza and from Mr. Vicente Constantini, whom I thank here.

Mr. Alberto Torrejón of Ibopeyti showed himself to be a host full of intelligence, and his intervention on my behalf with the Indians was very useful to me.

114 123 I should show myself ungrateful and unjust if I did not here express all I owe to the Indians themselves, whose reception, once the first mistrust was dissipated, was always so cordial, so generous. Here I should like to cite the name of my old friend, Captain Karnapadyú, of Carurutí, who was a courteous and kind friend to me and who made my stay in the Caipipendí valley so pleasant. Some day may I come back to my Chiriguano friends with mules loaded with knives, cloth, and beads, and thus fulfill the wishes they expressed so often to me.

/338 cont./

241 Sorghum (triku) (Sorghum saccharíferum) (1):

[262] 1. Sorghum is cultivated only on a very small scale. It is a delicacy that the Chiriguano reserve for children, who suck its stalk.

/339/ Sugar cane:
Melons:
Watermelons (sandías):
Prickly pear (saini) (Opuntia spec.):
Fig trees:
Orange trees (in the missions).

[199] The Chiriguano cultivate only on a very small scale the plants which, like sorghum, sugar cane, fig trees, and orange trees, have been introduced by the Europeans. Of these only melons enjoy general favor.

248 They always devote some parts of their fields to the cultivation of plants of value only for their arts and manufactures. These are: cotton plants (mandiyú), cucurbitaceous plants (iá) which grow on the ground next to their squash and furnish the containers they need, roucou (urukú), which scarcely exists except in the northern part of their habitat, and finally a species of reed (Arundo donax) with which they make the shafts of their arrows.

249 They also plant tobacco (pétí), but I have never seen any in their fields. According to Nordenskiöld (10, p. 25), its [276] cultivation is insignificant and rare. The Chiriguano are not [123] great smokers, and the numerous packs of cigarettes I took along for them found only a few devotees. Among the Toba, Matako /Mataco/, or Chorotí /Choroti/ my stocks would have been exhausted in the wink of an eye, for these Indians love tobacco more than anything in the world.

276 The use of tobacco among the ancient Chiriguano, as among 756 their ancestors in Paraguay or Brazil, was reserved for the 824 medicine men for their magical operations. Their use made [198] of it a plant endowed with "mystical" virtues, and its

/339 cont./
consumption was limited (1).

1. Father Giannechini (Diccionario Chiriguano-Espagnol, etc., pp. 169-170) gives us very interesting details on this topic. Formerly, says he, tobacco was reserved for magicians and adults. He states that even today where its use is most widespread it is cultivated on only a very small scale. The Chiriguano do not have the patience to let it ripen and dry it over the fire in order to be able to smoke it.

When they were called to a sick person, the medicine men used to put themselves in a trance by smoking ever so much. By this means they discovered the author of the illness and gave him battle.

We shall see farther along (p. 76) the role of tobacco in the magical ceremonies intended to make rain fall.

At harvest time I visited the lands cultivated by the Indians of the Cururutí region in Caipipendí valley. From the end of February to the month of April, the Indians rarely spend the day at home. Most of the time they go to settle down in their fields, leaving the village as soon as the corn begins to ripen, not to return until the /340/ end of the harvest. The house of the absentees is made safe from all foreign intrusion by thorn hedges which they raise all around or only in front of the door. The latter can also be closed by a cot or bedstead, which they put up against it and anchor solidly (Fig. 6).

This temporary migration of the whole population of a village to the fields sometimes made my job as a collector rather difficult. It /Fig. 7 appears here/ often happened that I found myself in nearly empty villages. The rare Indians who had remained there refused obstinately, and rightly, to sell me the objects which interested me, if they belonged to an absent person.

[Fig 6 appears on p. 69 - Analyst]

/340 cont./

421 Property is a sacred thing among the Chiriguano, and the nearest relatives cannot dispose of their belongings without their formal consent.

241 115 123 At the time of my stay in Carurutí, I once asked my old friend "Captain" Karnapadyú to take me to his field. He was very

249 407 797 142 291

241 115 [123] touched by /Plate VI appears here/ /341/ the interest that my wish implied and in an instant showed himself ready to do the honors.

His field was about 700 meters from the village on top of one of the cliffs which border the "quebrada" /ravine/ of Carurutí. Access to it was by a steep path across fallen rocks. The entrance [35] to the field was closed by a hedge composed of tree trunks and [417] thorny shrubs which we climbed over with the help of an Indian-style ladder, That is, a thick branch with deep cuts for steps.

[Text continues on p. 74]

Fermented Beverages

293 Anyone who has traveled among the Chiriguano or the Chané has learned to prize corn beer, or kãwi. Few moments in the course of my expedition have left me more pleasant memories than the ones when, tired by a long stage, I would sit down in front of a hut and receive from the hands of the wife of the "captain" a calabash full of this liquid, slightly sharp and a little granular, which quenches thirst and allays hunger. The day when the Chiriguano stop making kãwi will be a sign that they have disappeared from the face of the earth, and perhaps this delicious drink will survive them as a creole speciality in which good nationalists will take pride.

[122] [123]

Father Corrado (p. 43) once heard from the mouth of a Chiriguano an admirable definition of the role of kãwi in the life of an Indian: "It is our father and our mother," said he. Indeed, it is the father of joy, the sign of plenty, the companion of the most beautiful moments of existence as well as the most tragic ones. It has within it a mysterious and mystic force which penetrates the individual, exalts him, and protects him against supernatural dangers. All festivals are reduced, in their essential part, to the consumption of kãwi; no collective enterprise is conceivable without their first drinking it from full jars (1). From birth to death, all that affects the

293 726

1. Even in the 18th century the Chiriguano, like the ancient Tupinamba, did not undertake any expedition of war without having celebrated a caouin or a vin /wine/, to express ourselves like the old French chroniclers: /a passage of poetry in Spanish from Barco Centenera, p. 262, is omitted in the translation/.

When the Chiriguano of Parapití and Caipipendí rose up in 1799, before the revolt they held great drinking festivals, during the course of which they decided on the plan of operations (Corrado, p. 254).

/364 cont./

273 life of the individual or the community is associated with this beverage. The divine principle which kĩwi has in it does not take away its secular character; and, while one gets drunk on it during the festivals, nothing prevents washing down meals with it at the time when the corn ripens. As a sign of [594] hospitality every stranger is invited to empty a calabash full [596] of it; and the compliments he addresses to the wife of his host fill his heart with pride.

527 The Indians always appreciated the liking I showed 293 /Plate XIV appears here/ /365/ for kĩwi, and my old friend [123] Karnapadyũ did not fail to recall the big vats full to the brim to persuade one to return to celebrate Easter with them, or, if you like, the corn harvest, since these two dates coincide more or less. Such promises /Fig. 29 appears here/ could not remain without effect, and Karnapadyũ was not at all surprised to see me arrive shortly before the festival.

The greatest animation prevailed in the village of Caruruf, formerly so calm. Men came and went, bending under enormous loads of wood. All the urns were lined up in front of the huts and buried to a third of their height (Plate XIV, 1). 529 For a long time big piles of corn had already been heaped up 273 in the village, which all, big and small, men and women, 273 /Fig. 30 appears here/ were actively engaged in husking. [412] Some used their fingers, others knives or a pointed stick. Not [413] one had thought of the so practical instrument used by their ancestors: a small wooden peg with a leather loop to put two fingers through. It is curious to note that such a simple object fell into disuse; an old man still sold me a specimen made of iron but a close copy, so to speak, of the wooden prototype, of which it reproduced the smallest details (Fig. 29).

273 Now the hardest work begins: the grinding of the kernels. Day and night the dry noise of the pestles crushing the corn [461] resounds in the village. Often, to get the chore over more quickly, three women group around the same mortar and with surprising speed raise and pound their pestle without a single [415] error in rhythm interrupting their laborious work. Once ground, the corn is sifted in an urumpesa or large-meshed sieve (Fig. 31). The rather coarse flour is poured into large urns filled with water.

[123]
[114]

Kiwi is too respected a drink to be drunk in any old way. Etiquette requires one to comply with certain rules if the honor of participating in a drinking bout is done you. I sometimes had a chance to be invited to these festivities, and on such an occasion I was able to make the following observations which I am setting down just as I noted them in my field notebook: The men are seated in a circle on chairs or benches. The women squat behind them, on skins spread out on the ground. The kiwi is brought in vessels shaped like bulls, and one of them is put down at the feet of the "captain." The girl who has brought it fills a small calabash and offers it to the "captain," who empties it. Next he serves me and gives the vessel back to her. He does the same with my neighbor, then with several of the guests. Then he hands the calabash to his wife and goes to sit down. The latter serves the rest of the men present.

[954]

A second vessel, brimming over with kiwi, is put this time before another Indian who perhaps is held in some esteem. He drinks first, then buries himself with his companions. Two large calabashes are then given over to the women, and from that moment on, the distribution no longer seems to follow any order. Men and women drink and serve their neighbors without obeying any rule of decorum other than not to forget other people. They acquit themselves perfectly in this duty of politeness, and nobody is neglected, not even the very small children, who take alarming quantities of kiwi.

Fig. 45. Fabrication of a large vat: the potter impresses her thumbnail into the still soft clay to obtain a regular design.

In some villages there are no more potters. The inhabitants of the toldería of Ibopeytí, for example, have to import the painted vessels they need to celebrate festivals. When I wanted to acquire them, it was generally objected that they had been bought and often at a very high price. "You go away and leave us without vessels," they often used to say to me as a half-joking, half-sad good-by after my raids.

/476 cont./

123 Drawings. On Plates XCI-XCIII one can see gathered to-
126 gether a certain number of drawings executed for my sake by
532 Chiriguano Indians. In order to obtain them I first approached
several old men, who refused with an outraged air as if I were
123 asking them to do a thing beneath their dignity. A small boy
126 of 12, Consito, two young men, Asensio and José Miguel, and
115
532

524

Fig. 136. Indian executing the mobile string figure called "culo de caballo /horse's rear end/.

123
126
115 a girl, Iwawasei, showed themselves willing to cover the pages
532 of my album with all kinds of sketches.

Consito did not have to be begged: I was proposing to him a game not only pleasant but fruitful, and he had soon filled two pages (Plate XCI, 1, 2, 4, 9; Plate XCII, 2, 4; Plate
115 XCIII, 1, 3, 10). Asensio, my faithful friend, also gave me
123 complete satisfaction. He was a curious individual, and I keep
126 a particularly vivid and congenial memory of him. He was 25 to 30 years old and was conspicuous because of his extraordinary
[322] activity and ingenuity. At any moment of the day he could be seen busy cutting or carving a piece of wood which then

[See pp. 355-357-- Analyst]

/476 cont./

115 123 122 322 443 became an ingeniously conceived tool or still oftener a musical instrument. Asensio used to make violins which on first sight appeared to have come from a European factory. It goes without saying that he was the recognized carpenter of the village and the great provider of household articles. When Asensio had understood the purpose which had brought me to his home, he transformed his hut into a workshop for ethnographic objects: and I owe it to his enterprising spirit that I was able to collect many a piece, today no longer in use, which he reconstructed for me.

At the time when I was in his village, Asensio had received big orders for flutes for the coming Easter festival, [532] and I had a good time watching him work. Once an instrument was finished, he would embellish it with engraved animals.

115 122 532 The material on which Asensio (see Plate XCI /see p.355/, 5, 7,. and Plate XCII /see p.356 /, 3, 6) incised his figures exerted an indirect influence on the pencil drawings he drew in my notebook. They stand out by their angular character, but also by their cleanness.

José Miguel (see Plate XCI, 8; Plate XCII, 1, 5, 7, 9; Plate XCIII /see p. 357 /, 2, 4, 6, 8, 11, 12), whom Asensio's example had encouraged, asked me to give him the notebook and pencil, and he made me a whole series of drawings which, although rather light and uncertain, sometimes are not lacking in a certain movement. José Miguel had traveled to Argentina: [177] the train and the automobile (which he drew from memory) attest well to his admiration for the /477/ marvels of "Progress" (Plate XCII, 7, 8). Thank God his modernism had not made him forget his mythology, and he was able to draw for me a mythical episode which is to be seen on Plate XCIII, 12, A, B, C: the blue jaguar (yaguarowi, personification of the spots on the moon) is preparing to devour the moon and the sun.

123 122 532 When I had finished with the men, I wanted to have several feminine drawings, imagining that the women would lend themselves willingly to this game since they are the recognized artists of the tribe. All, unanimously and to my great surprise, refused to do it, shouting in the middle of gales of laughter: Aikuaá "I Can't do it, I don't know how."

/677 cont./

000 laughter: Aikuá "I can't do it, I don't know how." Only one,
123 a girl, Iwawari, allowed herself to be persuaded by the promise
182 of a spool of thread. Her awkwardness was not feigned, as I
115 was able to see from the beginning, seeing the embarrassed air
532 with which she took the pencil. Once ready to draw, inspiration was suddenly lacking. She stopped short until I had penned out a vessel to her to copy. Since her confusion only grew greater, she asked Cocoto, the small boy who made my first drawings, to help her. He drew the vessel on Plate XCII, 10, which she began conscientiously to reproduce in series. I protested, and then she made me a horse and on this horse's back a man and a child, then a woman (Plate XCI, 3 and XCII, 7). I am not very sure that all the drawings she told me she had made were hers, for when my attention was diverted by a visit, she had Cocoto secretly help her.

532 The drawings the Chiriguano executed for my sake recall not
171 only those of our children but approximate appreciably those which have been collected in various regions of South America, notably among the tribes of the Negro River (Koch-Grünberg, 1); the Tasiipang and the Makú (Koch-Grünberg, 3, Plates 28-32, pp. 129-161); the Indians of the upper Xingú (Steinen, 2, Plates III-IV), (Max Schmidt, 2, Figs. 245-247, pp. 198-199); the Chorotí and the Ashluslay (Nordenskiöld, 2, Figs. 63-66, pp. 130-137); the Kaingué (Ambrosetti, 2, Plates I-III, pp. 674-692), etc.

There could be no question of making a comparative study of these drawings, so uniform is their style. The only details which are worth being brought together are those denoting similar psychological characteristics and yet these common traits are not characteristic of a primitive mentality. I should scarcely have to point out the fact that in drawing a woman, a Kaingué Indian proceeded exactly as did two of my Chiriguano artists (Plate XCI, 3 and 7): he began by representing the woman naked, then dressed her.

532 /end cont./

Chapter XIV

The Treatment of Illnesses

Sorcerers and Remedies

956 178 Sorcerers. Medicine men have become so rare among the Chiriguano that I could not get to know a one during my whole trip. Only on the upper Pilcomayo did they allude in front of [125] me to a talented paye who lived in a nearby village.

Although great sorcerers endowed with supernatural powers and surrounded with great prestige no longer exist, there still must be in each village a man or woman capable of curing certain illnesses and of pronouncing incantations.

A scene I witnessed at Timboy (Salado River, upper Pilcomayo) demonstrates well that the profession of sorcerer, less important though it may be, has nevertheless not disappeared. I was living in the home of a Bolivian half-breed whose [122] child's body was covered with purulent pimples. His parents began by appealing to my medical knowledge, but I declared myself incompetent to treat this case or any other. They then 95 called an old Indian woman, who appeared one morning with [124] a plant in her hand, a kind of wild pumpkin which the half-breeds call sandía del monte. This plant, crushed and mixed with hot water, is used for external washing. They stretched the child out on the ground and commanded him to hold himself motionless. The old woman sat down near him and began to mutter inaudible incantations which she interrupted only to spit often on the limbs of the little patient. Then she would take up her recitation again, at the same time spreading the saliva over his body from head to feet. Nordenskiold (5, p. 44,

/136 cont./

775 If one asks the Indians about this point, they answer that a woman has seen in her dreams the shade of her departed husband, or he that of his departed wife, and both, those of their children, relatives, or grandparents, for all of whom they have an excessive fondness, and it can be deduced from this that in the Chiriguano race there is a confused belief in the immortality of the soul, since, with regard to the body, they themselves can see that everything turns to dust and earth.

775 776 192 Some explorers and travelers have set down in writing that they call the soul Afia; the Indians also confirm these accounts, but they do not give the name Afia indiscriminately to all souls, but only to those which had a very bad death, such as suicide, and those who took a long time to die. But in no case would a mother call her child's soul Afia, nor would relatives use this term for their departed, because Afia means demon or evil spirit (1).

[93]

1. At times I have been called to pray near a person gravely ill, so that he might die sooner and thus be free of that spirit, which, according to them, is bad; but I made it understood to them that I would neither pray as they wished nor was the sick person evil because of taking a long time to die.

The true enemy of the Tupa is the Afia, demon, but /135/ this latter word only means demon through use, just as iñ by the same use means soul. The Indians today give both terms the meaning that I attribute to them, and I still lean on the authority of Father Corrado, who in his catechism defines Afia as demon, Anihoata, place of demons, Afia imma, the demon's companion, yaneñgle, our soul, iñgle, their soul. The Indians have great fear of a demon and seek protection by demons; they say that they frequently see them at night, and when they have to walk in the shadows, they carry a burning firebrand (1).

775 776

[92]

1. Afia means phantom in Chiriguano; iñ means shade, cuarai iñ pe, in the shade. Missionaries should make them understand the true meaning.

4: Nmo--194 M-2 (1893-1911) .917 [illegible] Chiriguano [illegible]

/135 cont./

775 776 because the Indians know that the evil spirit is a phantom, and the soul of the dead a shade: chemembi if shecha. I saw the shade of my son, says the mother.

776 784 [123] One night while the smallpox epidemic was going on, they called me, being the Convenor of the Santa Rosa Mission, to catechize a poor and miserable old woman who was some two and a half kilometers from the town. Among those who accompanied me there was one whom I well remember, who is still alive and whose name I shall not forget, who carried a burning firebrand, which was not necessary for me because the night was quite bright. When he was asked the reason for such a thing, he answered: Afia afuguae vaena, to chase away the demons. They all do this especially when they are alone, which is rare, because the Chiriguano only rarely goes out at night because of his fear of evil spirits.

776 174 171 From this it can be deduced with considerable probability that the Chiriguano are descendants of the Guaraní of Paraguay. There were in that region, in past centuries, the missionaries of the Company of Jesus, who are famous for their apostolic work and for the suffering which they experienced in the reduction of the region. Because of the sorcerers some of them even suffered martyrdom.

I had the opportunity to read a brief history, which I have mentioned above, written by Father Antonio of this same company, and I learned that the Guaraní believe in sorcerers and saw the Afia, demon, at all times and places. It destroyed the wheatfields and other plantings, did damage in their houses and burned them. Even the Guaraní called the bad spirit Afia which the said missionary applies to the demon (?).

2. A work written in the Guaraní missions of Paraguay.

/139 con./

Belief in the Future Life

[195] This belief has suffered many more alterations than the previous one; nevertheless it reveals that even under the rude and ignorant nature of the poor Indian and the unfortunate Chiriguano there is in force the idea of the great philosopher, non omnis moriar, which so many materialists would have end with material life, doubtless in order to drown apparently the remorse of the gnawing worm which from time to time appears and unintentionally reminds us of the perversities which have been perpetrated (1).

[77] 1. It is difficult for the Chiriguano to understand spiritual matters, for which reason his ideas concerning the future life are purely material. Without revelation this dogma of faith is not understood.

When the soul of a Chiriguano leaves the body, it does not die. All, without realizing it or even suspecting it, have this idea of the immortality of the soul. Mourning and sentiments of grief, burial, and things that they put in the coffin when someone dies, with which I shall deal later, are related to this. Should someone ask them about this, they would answer, "Mahanu" How will it be? I don't know. In spite of this ignorance, in order to express their thoughts regarding the soul and its immortality, they admit that there are three places for souls: Tunparenta, Iboca, and Cuarasigli, Heaven, Purgatory, and Hell.

[123] [191] I am going to deal with the three, rectifying what concerns Iboca, which belief I was acquainted with from the beginning of residence among the race and an account of which can be found in my little Nene, which was printed in the year 1905 to help Chiriguano children learn the Spanish or Castilian language.

The Tunparenta is literally the place of God, or his dwelling place, as the aflarenta is the dwelling place of the devil. I have already noted the fact that Tunpa is the source of good, of all virtue, of everything good: Tecocavi. With this idea that he has of God, the Chiriguano naturally concludes that God only

/266 cont./

574 576 [194] The second t of the word tuti is pronounced double (1).

1. In other places the salutation is different. They say Catapiri or Aguyeti, good things, prosperity. But the other seems to me to be more in conformity with the universal salutation, as is done everywhere.

If the visitor is a person he knows, the host then says, Nde pa co? Is it thee? And the other answers, Checo, it is I, and then goes on to say Imeño pa nei? Are you living? Imeño aí, I am living. And he enters the house of his uncle, grandfather, brother-in-law, or whoever it may be, since it seems that the Chiriguano has relatives everywhere, and he would have them all over the world, if there were Chiriguano all over the world.

574 576 622 Often it is the cacique who receives strangers, if these come looking for him, as naturally happens, but any Indian at whose house he may come will at once say to him with all courtesy, Eyú, come in, if he is on foot, and Egüeyi, come down, if he is mounted. At once he presents him with the best seat that he has and begins the conversation; meanwhile the lady of the house puts at his disposal a large jar of chicha with the respective maté or tumbler, and, aided by her daughters, she prepares the best meal. The captain, or cacique, of Tiasía prepared for me a maté of boiled corn with salt, arivivi, or very hot chili peppers, and hard-boiled eggs chopped into small pieces. 123 [622]

I noted the great cleanness of the food and the utensils, and then, as I have already said elsewhere, I had a long talk with the Indian, who was quite loquacious and frank, about various religious matters, and in conclusion he made me understand that he would not go to the Boicovo Mission or to the others, because prayer and baptism cause death; that my companions and I had made it not rain that night in order that we might not get wet, and that it is not God who created man, and, when asked who it was, he answered naturally and with astonishment, Ndicuaá á pa? Don't you know? (2) /Illustration appears here./

797 771 2. In the other place I did not set down everything

C 123 439 [437] peculiar shop. If an Indian woman came there with money in order to buy something, she was politely sent away by the clerk, but if she came with an attractive old clay vessel, she became the happy owner of corals, fire-red ribbons,

/152 cont./

earrings with real "diamonds," rings with "sapphires," or other 123
fine things, which she could then show off at the next drinking bout. 439

There are always two villages in these mission stations, 437
one for the heathens, one for the Christians. I myself always felt 361
more comfortable in the former, and this not only because more 797
fine, old things were to be collected there, but also because the people there were friendlier, more tactful, and more polite in their behavior. The mission children were importunate and impudent.

Near Machareti there is a large basin-shaped valley through 133
which flows a little brook that probably swells to a roaring river after a violent tropical rain and disappears in the wilderness of the Chaco. Quite near the mission it leaves the handsomely dissected [135]
mountains, where small petroleum springs trickle out everywhere in the crevices of the cliffs. Then it flows through a hilly landscape that gradually turns into the vast flat area of the Chaco. The vegetation in these regions is not very luxuriant. The wood- 137
land, when such is present, is sparse, low, shrubby, and monoto- 241
nous. The fields seem to produce abundant harvests, the droughts seldom too long. These regions are often devastated by huge 731
swarms of locusts. I have seen these destructive animals cover the 136
woodlands like large, reddish-brown clouds.

From Machareti we went by way of Itatiqui, a very interesting 114
Chiriguano village in an arid region, to the Rio Parapiti.

The latter comes from Pomabamba and Sauzes, from the 133
/153/ mountains of the Quichua /Quechua/ Indians. After it has left these, in the rainy season, it is a roaring stream overflowing its banks. In the dry season it carries little water. The Rio Parapiti also ends in the Chaco. During the rainy season it is lost in the swamps; in the dry season it disappears in the fine sand. If the Rio Parapiti parades on the maps, as the southernmost tributary of the Amazon River, this is only empty boasting on its part. The woodlands along the Rio Parapiti consist mostly of 137
bushes and low, fine-leaved trees, caraguata, and cacti.

/157 cont./ One old woman who was supposed to know Chané very well said she would teach me after she had reached the realm of the dead. Since the Indians in this happy place are not bothered by whites, and not by ethnographers either, the promise of the old woman was not very friendly.

The Chané use their old language for many expressions that are abusive, for example, karitimisóyti, which they translate as son of a w---e. An invitation to coitus is called pocóne. There are also songs in their /158/ old language, for example, siparakinánoyé, siparakinánoyé, siparakinánoyé, tonéya, tonéya, tonéya, which they did not know how to translate.

From the Rio Parapiti I again visited the Chiriguano chief Taruiri in the Caipipendi valley, where I sought to buy as many old ornaments and other valuables as possible. Besides Taruiri I also visited another chief, Yumbay, an old worthy who was always embracing me and saying: "I am Yumbay." /Fig. 77 appears here./ "Yes, the great, mighty Yumbay," I chimed in, which made the poor reduced fellow feel very flattered.

From the Caipipendi valley I went by way of Pipi to the mission at Ivu. This lies in an arid, lonely region with little water, near several huge mountains, and the life there must be dreadful. When smallpox was very prevalent in the region, Father Bernardino successfully prevented the disease from spreading into the mission by vaccinating all the Indians living at the place. Father Bernardino is a truly unselfish human being, a genuine missionary. As a result of the vaccination, no one in Ivu died of smallpox, whereas the sinister disease raged frightfully among the whites a few miles from the station. It almost served them right. If anyone died of smallpox, the corpse was laid on a table decorated with paper flowers and a crucifix. Around this the other swine would get drunk and /159/ continue to drink obligos (1) until they were finally lying on the table.

1. If a person drinks obligo with another, the latter must drink up.

/159 cont./

In the village of Cuevo alone 60 out of 200 persons died within a short time. I visited the 140. They were as gay as ever. Spirits and beer were consumed in quantities. 114 64 [65] [273]

Father Bernardino was never given credit for this work, but rather the medicine men, who had bewitched the sickness so that it would not come to Ivu. The white colonists, too, occasionally had the medicine men come in order to /Fig. 78 appears here/ drive away the sickness. They did not believe in the vaccine either. 797 756

With Ivu as the starting point, I made a trip into the 114

415 531

Fig. 77. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/6.

Igüembe valley, in order to visit the Chiriguano chief Maringay. 114 It was a charming ride on horseback up on the high crests and down into deep valleys, through an often grandiose, colorful landscape. These valleys are poor in forests. Only in a well-protected ravine in which a brook trickles forth is the vegetation luxuriant. [133] [137]

I soon became very good friends with old Maringay. The old man was conservative, clung to the old customs, and felt that the Indians should be on good terms with the whites, but should preserve their old habits and customs unchanged. His village was extraordinarily interesting and very rich in old, fine things. 123 157 173 643 000

/170 cont./ Ce

The legendary figures and their experiences stimulate the imagination, are preserved and retold. The historical personalities and events are forgotten. 173 Ee

If one looks in Chané and Chiriguano houses, one finds many things preserved which are now no longer in use, /171/ but which they value as mementos of earlier times and often do not want to give up. For example, one sees handsome round pipes, "huiramimbi" (Ill. 80), which have undoubtedly been handed down from generation to generation. They were formerly used in connection with expeditions of war. Old Maringay had kept all kinds of things from olden times. It gave me great pleasure to rummage about in the old man's storage places. I wanted to buy something from him, but felt embarrassed to offer him money for his mementos. 523 Ee [276] [721] c 523 123 126

I once found a bundle of fine, old, completely smoke-blackened arrow-points stuck into the walls. "Would you not like to sell them to me?" I asked my old friend hesitatingly. "You shall have three as presents," said Maringay. After this refusal I let him keep his cherished things.

Once I rode away from Vocopay's village in order to look up an old Chané who had an attractive old costume. After some hesitation he showed it to me. He had carefully wrapped it in other material. Like an enthusiastic museum official taking out an old gem, he unwrapped it carefully. One unmistakably saw how dear it was to him. Although I offered him a very high price, he did not want to sell it. Ce 523 123 126 c Ce

The fact that these Indians love their old keepsakes shows that they have a certain degree of culture. This is true only of the old people, however. The young ones are no longer like that; they sell everything without hesitation. What do they care about a worn-out old festival costume if they can get a red, fluttering scarf and trousers with jacket in exchange! The triumphal march of trousers across the world has also reached these valleys and plains. 523 178 c Ce [177]

The Chiriguano and Chané no longer carry on regular war with other Indian tribes. Occasionally, however, the Chané on the Rio Parapiti make raids on the Tsirakua Indians. Ce 721 c [721]

/186 cont./

It is strange that peoples who fish so much are acquainted with so little fishing gear. In my description of the Choroti and Ashluslay, we have already become familiar with this deficiency.

On the Rio Pilcomayo, Moberg and the author once wanted to give the Indians the benefit of our fishing experience and constructed a weir of which we were not a little proud. We set it out, firmly convinced that in the morning it would be full of fish. All we caught was wood and refuse of all sorts, and I cannot deny that the Indians ridiculed us a bit.

The reason for the poverty of these Indians with regard to fishing gear is not a lack of ideas, but a different one. There are, quite simply, few fishing methods suitable for these waters. Setting out a net at night is not feasible, for if a palometa fish gets into the net it immediately cuts it in two with its knife-sharp teeth. Fishing with a hook where there are such fish is also not enticing, for they bite off the hooks as easily as the lines, if these are not made of good material. In these tropical waters the fishing gear also rots more quickly than among us and thus should not be left in the water all night.

The Chiriguano and Chané have no vessels. On the other hand, they are extraordinary waders, and to wade in the rivers here during the rainy period is not exactly a small matter. If, however, one has the assistance of one of these Indians, one can cross if it is possible at all.

As an oddity I might mention that during my entire journey I never saw a native white or mestizo fishing. In Bolivia it is not refined to eat fresh fish. On the Rio Pilcomayo /187/ the officers of the military post almost never ate the delicious, fresh, salmon-like fish from the river, but preferred canned salmon from Alaska. Since this is very old by the time it reaches Bolivia, it tastes dreadful. Fishing with a hook is also the only method of fishing that the Indians learned from the whites.

As for domestic animals, the dog is the only one that the Chiriguano and Chané did not get from the whites. These dogs now seem to me to have a strong mixture of foreign blood. They always have names, for example, tirupotchi (old garment), /Fig. 91 appears here/ chapikáyu (yellow eyebrows). As a rule,

C 524 /197 cont./

I saw the "parama" game played by the Chiriguano in the Caipipendi valley. It is played by two. A button or the like is placed on a stone as a goal, whereupon they throw small round stones made of clay shards. The button is supposed to be struck down, and the one /Figs. 100 and 101 appear here/ who comes closest to it wins a stroke. The game goes on until one of them has five or more strokes, according to agreement.

C Ce 524 The Chané and Chiriguano children also have a number of toys which are illustrated here (Figs. 104-105). One of these, "mou-mou" (Fig. 104), is strange. With it /198/ a buzzing tone is produced if the threads are first twisted and then stretched.

Ce 524

Fig. 102. Maize-cob arrow. 1/3.
"Sóuki." Chané. Rio Parapiti.

Fig. 103. Little stick for the huirahuahua game. 1/3. Chané. Rio Parapiti.

Now I have no doubt properly bored my readers with Indian games and toys. Perhaps I have dwelt too long on this subject, so little studied in South America, which interested me keenly on my journey. As among the Choroti and Ashluslay, I liked playing with the boys. This is also a way of coming closer to the Indians, of winning their confidence.

Ee [123]

Ee 85 [797] [177]

Like the Choroti and Ashluslay children, the children of the Chané and Chiriguano are seldom bored; like the former, they are well-behaved and good children. It is usually very lively on the playgrounds in the villages. This is true of the heathen. The children who have fallen into the hands of the monks look melancholy and reserved; they have already been given a taste of what the children of the white man learn, training and the beginning of civilization. "You shall..." "You shall not..."

C Ce 881 [302] /210 cont./

When a girl has her first menstruation, she is put in a compartment in the hut, a sort of closet. Her hair is cut short, and she may not come out until it has grown medium long again. Ce [262] Accompanied by her mother she may go out and attend to her needs, for example, bathe, etc. Between the first and second menstruation she must stay on a diet. She may eat cooked maize and meal. The Chané call this custom "yimundia."

C 881 •123 In a Chané village, Aguarśti, I saw a girl who was sitting in such a closet. She was spinning. I peered into the closet, which was probably wrong of me, for on the next day girl and closet had disappeared.

C 881 P. Chomé (1) already mentions this custom in connection

C [113]

1. P. Chomé, p. 320. The same priest also speaks of the custom of the couvade among these Indians, p. 321. Lettres édifiantes /Edifying Letters/. Vol. XXIV.

C [825] with the Chiriguano. He says the Indians believe a snake has bitten the girl.

C Ce 881 582 When the girl emerges from this imprisonment, she is marriageable.

Ce 852 304 [301] Ce [603] /211/ When the Chané boy is about 10-12 years old, his lower lip is pierced by a man particularly experienced in this. A small piece of wood is stuck in the hole. The boy must lie down for a day. His grandfather comes and tears deep wounds in his body, so that he will become brave in battle and a capable hunter. In the morning, when it is still quite cold, he takes him to bathe, so that he will become a proper man.

Ce [262] [191] For one day the father may not consume anything, so that the boy will not become loquacious. This shows that the Indians do not like prattlers.

Ce 301 885] When the boy grows older, he receives in place of the small piece of wood a larger one, and when he becomes a man he may parade around with a large plug, "tembeta," in his lower lip (Fig. 79). This is supposed to be of wood in which pieces of turquoise and chrysocolla are set. Among the Chané and most of the

C [301] [78] Ce [78] Chiriguano only the old men now have the tembeta.

Chapter Seventeen

On the Life of the Chané and Chiriguano Indians (Continuation)

Legend and Religion

Ee
538

Once there was an old Indian who used to sit beside the fire in his hut in the evening and tell about olden days, about animals, human beings, and spirits. The young people gathered around him, listening. The old man went on and on telling stories. He told them with his mouth, eyes, hands, and feet.

One young person after another, however, soon left the circle of listeners and lay down to sleep. Finally the old man was sitting alone beside the dying fire and talking to himself about the adventures of the fox-god and the armadillo-god.

To me this old man represents the old traditions, a culture that is disappearing. The young people listen for a while, but it is soon too much for them. They have new interests. They have begun dancing the great dance which the Christians call civilization, where the dancing is usually around the golden calf.

Ee
[123]

I also sat there as a listener and had the legends explained to me. I believe the old people liked me because I showed such great interest in their old recollections. If I now retell them, I hope the reader will be lenient with me and my old friends, with me because I cannot tell a story as well as the old people, and with the old people because they love everything that is a bit frivolous.

/251/ The legends give us insight into the Indians' ideas of the life beyond and of the spirits. In part through them and in part through the explanations which the Indians have given me, we can understand their religion. We shall hear about the destruction of the world and the theft of fire, about the visit in the realm of the dead, and, above all, about the adventures of the spirits; we shall hear how they deceived one another and human beings, hear of their combats and their vices.

/xiv cont./

114 the Franciscans Conrado, Cardús, Martarelli, Giannecchini, and Señor del Campano, etc. But in Bolivia no complete work is known, notes or pages by authors definitely worthy of every respect and very competent hardly exist, nor have explorers witnessed all that they have written about, from which have come errors which would certainly have been avoided if the reports had not been made so hastily.

121 With all possible calm, patience, and unlimited time, I
[124] have set out to talk with the oldest and most knowledgeable Indians, who have explained some points to me, corrected certain others, and made me add still more; but I have already said that with my writing I do not pretend even to equal the luster of those who have preceded me. I shall only give more extension to the ideas which have been set forth by others, ideas which in the majority have been confirmed by the Indians to whom I have addressed myself.

Finally, I must state that since the Chiriguano are in contact with the mission Indians, and these, both old and new, exist in considerable number, I shall add by way of conclusion, after having finished what I have proposed to do, a chapter concerning the heathen Chiriguanos, the neophytes, or new Christians, and the method that the Missionaries use to reduce them religiously and civilly, and the effort required to maintain them in the Catholic faith.

121 Everyone will understand that, in order to avoid confusion,
128 this small work will be divided into chapters, and the chapters into sections, for greater clarity and so as not to tire the reader. Certain terms that I must print here by necessity will be written in the Chiriguano language with their corresponding explanation, so that each one may understand the impact of the language. I could also formulate some general propositions with the corresponding Spanish, but the nature of this somewhat voluminous book does not permit it, nor is it necessary, because /xv/ there are various small handbooks which have been printed in this Republic of Bolivia.

/128 cont./

121 exist, even among savages, since it could be said that, just as there is no people without God, neither is there a people that does not show Him homage in some way.

771 As far as the Chiriguano are concerned, I have tried to find out with special care, constancy, and assiduousness what religion 124 they profess and what type of worship they render to their divinities. But all my efforts have been in vain. This is no doubt due to their state of ignorance as a result of their savage life.

[115] I have asked the oldest men of the tribe about their religion, and I have only received vague and insufficient answers on every point, thus being unable to form any idea, even an approximate 776 one, of the religion which they profess. It is beyond doubt true, 775 however, that the Chiriguano have some religion, since they recognize a superior being. They admit the immortality of the soul, rewards and punishments in the other life, and they preserve certain Biblical traditions which would have no explanation if they did not believe in a god and perhaps in the Jehovah of the Holy Bible, or God, Creator of all things (1).

[805] [771] [192]

1. The Chiriguano, like the Hebrews, count the months by moons, and they have other very similar customs. It is very notable that they also have some Hebrew words.

577 /129/ The Chiriguano must have a moral code, that is, 771 natural law, perhaps augmented by some traditional precepts, since they admit rewards for the good and punishment for the bad.

The law, to the extent that it is imperative, comes from the same God, but only religion serves as its base, and this teaches men that it is an unavoidable duty to submit to the precepts of the Supreme Legislator, under penalty of falling into grave punishments conceived by Him.

From what has been said, it can be understood as a logical consequence that the Chiriguano do profess some religion, even though this might not be known.

/130 cont./

What I am going to set down here will cast some light on this subject and will enlighten the intelligence of the studious man for its investigation.

From conversations with the true Chiriguanos it is impossible to form any idea of the supreme being that they accept. I say true Chiriguanos, by which I mean those who have had almost no contact with missionaries or whites. Today it is difficult to find one of these. Yet despite this, if one should ask the old people who live far from the missions, "Who made all that we see?" they answer, "Quia ndigó?" Who can it be? "Who created us?" They answer: "Ti! Ndicuaá á?" What do you mean? Do you not know? And they give a purely material explanation, as happened on an exploration and trip that I made several years ago in the company of other missionaries south of the canton or town of Huacaya, where I talked with an old cacique who had taken part in the war of 1875 against Iglembe and who, after the pacification, preferred to live outside the mission and planned to die there, because he is convinced that Indians who live in missions die earlier, just as, according to him, all of his companions from Boicovo have already died, which is not true, because they still are alive there, as old as he is (1).

1. The Indians have had and will continue to have the false and erroneous idea that baptism makes those who receive it die, because it is administered to men and women who are in immediate danger of death, and hence those who are old do not wish to be baptized when they are enjoying good health.

192 In the Chiriguano language we find the word Tunpa, which means "superior being" or "marvelous being." When for the first time they saw a large clock with its "tick, tock" and the pendulum making the hands move and giving energy to the hammer to strike the hours with its little bell or wire string, when they saw for the first time the photographic camera which reproduced the image of one or more of them, the clock and camera were Tunpa for the Chiriguano. They applied this word to both things.

Ea [115]

out that even the women among the Indians on the Xingu and Rio Negro speak of sexual parts quite openly, as of something natural. The same is true among the Indians with whom I became acquainted. When I inquired about words touching on the most intimate things, even the women, indeed, the young girls, answered in the most natural manner.

Ea [124]

There are words, however, which are prohibited. Such words among the Chavori are "amenché," which is an abusive word, "ictivähi," which designates homosexual intercourse, "huéie," which means onanism, and "tévi" among the Chané /222/ and Chiriguano, which has the same meaning as ictivähi. Here, too, the unnatural in sexual life is so shameful that it is not proper to speak of it.

Ea 195 834 838

c 834 838

There are also Indians who never want to speak about such things. This was true, for example, of a Chiriguano whom I had with me on my first trip on the Rio Parapiti. He even pretended that he had never heard such things mentioned. When I asked him about homosexuality among his countrymen, he feigned stupidity and said more or less: "Is that what the whites do?"

c [124]

Ca 538 871 [551]

Among the Indians, as among ourselves, there are nevertheless some who take pleasure in telling obscene stories. Such a one was the old Chané Bóyra, he who had the abusive name yúruhuasu, big-mouth. The more disagreeable the things he related, the more old Bóyra enjoyed himself. Sometimes he told such things that even my friend Batirayu, who used to interpret, was quite embarrassed. The old Chiriguano Yambási was also one who could tell all kinds of obscene stories.

Ca [115] c [551] [871]

/295/ Preface

114 12 In the chapters to follow, I propose to publish part of the results obtained in the course of the expedition that I undertook in the Bolivian and Argentinian Chaco in my capacity as director of the Institute of Ethnology of the University of Tucumán.

114 [101] This expedition took place from February to June, 1929. Its itinerary was the following: Having left Tucumán, I went by railroad to La Quiaca where I stayed for several days, making observations on the more or less half-breed natives of the region. From La Quiaca I went to Tarija, where I remained longer than I might have wished because of the suspicions my trip raised at the time of the Paraguayan-Bolivian conflict.

114 101 103 After a 15-day stop I left Tarija to reach the Chiriguano tolderías of the upper Pilcomayo. I crossed the village of Santa Ana, then the Alta del Cóndor, the Narvaez River, the post of San Diego, passed five kilometers from San Luis (Entre-Ríos) to stop at the Cuesta de San Simon, where I found the first Chiriguano. Once having crossed the Cuesta de San Simón I quickly reached the Salado River, then the Chiriguano villages of Timboy (Saladito). It was there that I made my best acquisitions of [126] pottery and where I collected the oldest objects. The inhabitants [178] of these rancherías, who live relatively far from the highway from Argentina to Santa Cruz, have preserved the traditions and culture of their ancestors better than their racial brothers have. From Saladito I reached the village of Itasití and then Salado Grande, [361] in order /296/ to reach the Pilcomayo at the confluence with the Salado. There, the Chiriguano villages are large and numerous. The most interesting are those of Ñawirenda, Ibopeytí, and Yumbía.

After stopping for some time in this place, I continued my trip toward Huacaya and the mission of San Pascual de Boicovo.

In one day I went from Boicovo to Cuevo, going by way of the mission of Santa Rosa.

[199] [178] From Cuevo on I was in the mission of Ivu, which is without doubt the one where the old Chiriguano customs have undergone the fewest modifications.

/297 cont./

121 114 Father Bernardino de Nino, it is only a translation of Campana's article, filled out with copious borrowings from Corrado's work. Nevertheless the Reverend Father Bernardino de Nino added many very interesting details to the texts that he reproduces, which make consultation of his Etnografía chiriguana indispensable.

121 126 My aim was to complete the work of my predecessors and to get together for the Museum of Tucumán a collection which would be truly representative of the last of the cultures which formerly flourished within the limits of the old gobernación of Tucumán. My Chiriguano collections, along with those collected by Nordenskiöld, are, I believe, the most complete ones from this region that exist in the world. They bear witness, I hope, to the richness of this area from an ethnographic point of view, a richness which has been left unexploited and which will disappear in a few years.

121 May these pages demonstrate that every culture is a whole complex, so varied, that no ethnographer can study all its details in the course of a single trip. It is not useless to go back where others have preceded you, for, whatever their merits may have been, the material cannot be exhausted in one time.

122 There remains the paying of a debt of gratitude by thanking Doctor J. B. Terán and Doctor J. Heller, who, as rector and vice-rector of the University of Tucumán, gave me the means to bring about this trip. The new rector of the University, Doctor J. Prebisch, granted me the sizable funds which publication of the results of this expedition required and supported constantly the Revue d'Ethnologie of my Institute. I am eager to make known to him here how grateful I am.

114 122 I wish to express my thanks again to all those who helped me in the course of my trips first and foremost the Franciscan missionaries who gave me generous hospitality and helped me as much as possible: my debt is particularly great to the Reverend Father Jocundo Ferrari, thanks to whom I was able to carry out without damage the transportation of my collections from the upper Pilcomayo to Cuevo; to Father Angriani who received me so frequently in his Ivo mission. Neither do I wish to forget Fathers

241
412
243
[124]

Métraux used to cite to us the following example: during the great war the French soldiers did not much like using English shovels different from their own, and vice versa. The Chiriguano I have seen laboring on military roads in Bolivia handle our shovels exactly like any European laborer; but back home, when it is a question of working a field, they return immediately to the ancestral gestures and are constrained to adapt the form of their instruments to them.

The handle fits into a handgrip carved out of a small block of wood and set in with the greatest care. The latter generally takes the shape of a crescent on which the hand rests comfortably. The handgrips with an elegant curve, which gave an aesthetic character to the ancient spades, have become very rare. In the course of /335/ my trip I was able to acquire only two shovel handles which were provided with them. One comes from Ibopeyti (Fig. 3) and the other was made for me by an old Indian of the Ivu mission. The workmanship of this latter specimen is careless, but it reproduces fairly faithfully the ancient models (Fig. 4).

[124]

241
412
172
243

The use of the shovel among the Chiriguano probably dates back only three or four centuries. This instrument was unknown in ancient Paraguay where our Indians came from. The borrowing which could be presumed a priori has been confirmed by the discovery in the Quebrada de Humahuaca of wooden shovels similar in every detail to the ones I

Fig. 3. Shovel handle. Prov.: Ibopeyti. (1/11 nat. size.)

Fig. 4. Shovel handle. Prov.: Ivu. (1/8 nat. size.)

/347 cont./

433 between the roof beams. Once out of this region the ethnog-
123 rapher will have all the difficulties in the world to acquire
224 these weapons for his collections. If they are offered to him,
184 they will be either a few souvenirs of former days kept by an
[91] old man or crudely made specimens without any value other than that of a toy or a sport accessory for some rare lover of hunting.

294 The Indians of the semi-independent valley of Caipipendí
411 are still, in some villages, capable of making a bow and using
184 it. The arrows, which I bought from them in rather large quantity, almost all belonged to a single type and were intended, from what they told me, for killing the yakú (pavo del monte /wild turkey/ (Penelope sp.). They are long reeds armed with two barbed wooden rods (Plate IX, 1). One must not conclude that the yakú, abundant as they may be, represent an appreciable food resource. Besides, hunting is
[433] scarcely practiced except by the young men, who do it for
[124] fun. The Indian who gave up to me the handsomest lot of
[425] these arrows felt some remorse about it; for, as he explained to me, /349/ they belonged to his little boy, who would not fail to cry when he found out that his father had sold them without his consent.

357 Chiriguano children are even more ardent about shoot-
168 ing with a bow than men. One can see them run around the
224 village trying to shoot down with little miniature arrows (Plate XII, 2 and 4) the birds which light within their reach. Contrary to what took place formerly, once grown up they will not benefit from the skill they have thus acquired. /Fig. 16 appears here./

223 Some Indians of the Caipipendí valley sold me large
[124] bunches of nandu feathers. I could not find out whether they had taken them from birds killed in the region or whether they had been hunting them in the east nearer to the great deserts. That would not have been at all improbable, for nandus are certainly not numerous in this region; in a month's stay I
287 did not see any. These feathers serve for fashioning /Fig. 17
434 appears here/ feather duters, which the Chiriguano sell in the

[See Continues on P. 91]

/366 cont./

273 It is not so easy as one thinks to observe in detail the preparation of kāwi, and I am still at a loss to describe the stages in their exact sequence. This difficulty is due to the fact that kāwi is prepared over several days (generally three or four), and it is /Plate XV appears here/ /367/ difficult to be on the spot all the time so as not to miss any detail. Besides, as different families do not begin to prepare kāwi at the same time, confusion results; and it is hard to know at what point of the operation one finds oneself. Apparently I am not the only one to have come up against this obstacle, for it is enough to read the various descriptions devoted to this important occupation to become aware that they are far from agreeing.

126

[114]

273 462 At the moment when the water is at the boiling point in the big vats, the burning pieces of wood and the live coals are scattered, and the corn flour is poured in, being stirred vigorously so that it will not form lumps. While this operation is performed, other women have pounded fine a certain quantity of corn, sifted it, winnowed it to rid it of any impurity, then roasted it in a large potsherd. As this flour is taken off the fire, the women chew part of it and spit this into a calabash. This paste impregnated with saliva is called temišu. According to Nino (p. 248), the Indian women mix the temišu with the corn broth which is cooking in the vats and with which they fill a pot. The woman who busies herself with this mixture (umopirai) allows it to fall back in from a certain height "to give it sweetness."

[412]

Fig. 32. Sticks for stirring the kāwi while it is cooking. No. 1 comes from Tigūipa; No. 2 from Ivu; Nos. 3 and 4 from Saladito (upper Pilcomayo). (1/1 nat. size.)

/371 cont./

415 531 Certain vessels (Fig. 35) have the exterior surface entirely covered with these depressions obtained by pressure of the thumbnail. The Indians call this decoration tatupire, that is "armadillo carapace," /Fig. 37 appears here/ a completely justifiable comparison.

One can consider as an evolution of the process of ornamentation by finger impressions the angles or chevrons which decorate the outside surface of the vessel of Figure 2, Plate XVI /see p. 125/, which have been incised in the soft clay with a pointed instrument. This type of ornamentation can be reduced to its simplest expression; thus on the neck of the vessel of Plate XVII, 2 /see p. 127/ it is limited to a row of little cavities made with a pointed stick. The small vessel of Figure 36 /see p. 128/ with a belly flattened from top to bottom belongs, from the decorative point of view, in the same category.

415 531 171 On another vessel (Plate XVI, 1) the small nipples which project /372/ all around the belly constitute a summary decoration which completes that of the neck formed by fingernail impressions. Pots of this type are found among the Ashluslay (Nordenskiöld, 9, Fig. 65, p. 218).

This decoration is exceptional in South America. Jijon y Caamaño (p. 6) considers it characteristic of the northern part of Ecuador. He points out its distribution in Central America and in the Mound region in the United States.

[126] The ïru of Plate XVIII, Fig. 2 /see p. 131 / has the exact shape of a calabash; this resemblance was intentional, for the Indian woman who sold it to me presented it at the same time as the calabash which /Fig. 38 appears here/ had doubtless served as a model. Vessels which are almost replicas of this specimen have been found at Jachal and Calingasta in San Juan province in Argentina (Ambrosetti, 1, Plate VII, and Debenedetti, 3, Fig. 41, p. 69).

415 [462] 415 323 The Chiriguano call the vessels in which the women draw the water they need for their households by the Quichua name ïru. The ïru are characterized not only by their more or less globular shape and the narrowness of the neck on top, but also by the quality of the paste from which they were

/387 cont./

C 323 386 The name tarawirisi is also given by the Chiriguano to objects resembling loaves of bread kneaded by hand which are composed of a resinous material mixed with wax. According to the explanations given me by the Indians themselves, this

C 417 415

Fig. 60. Forked tree-trunk serving as a shelf for putting vessels on. (After a sketch by the author.)

C 323 386 substance is taken from a mimosa. After being sprinkled with boiling water, it is kneaded and dried in the sun. Its color is yellow or red, but after firing it becomes black.

I could not learn whether this black glaze was applied over a layer of black paint or spread directly on the walls of the vessel. In every case the designs made by this process are much less regular than the ones drawn with a brush.

C [126] My collections of pottery, which consist of nearly 200 pieces, do not contain any glazed specimen. Nordenskiöld (C p. 144) assures us that the Chiriguano and the Chané of the Parapití coat their yambui with a sort of gum called tarawisi, a word which, except for one syllable, is the same as the one designating the resinous substance we have just been considering.

C 114 323 386

/389 cont./

415 531 The plant kingdom hardly inspires Chiriguano artists. The vessel of Plate LII, Fig. 3, is the only one whose decoration is clearly phytomorphic; and again in this case I am not sure that

323 516 342 291 415

Fig. 61. Fabrication of a vessel: the exterior surface is smoothed with a chip of bamboo after being flattened with the hand.

415 531 a European model did not serve as an intermediary between nature and the picture the potter portrayed.

[126] [179] /390/ Among the 200 vessels I collected in Chiriguano country there is not one that includes a figuration of the human face, with the exception of the one to which I have alluded, whose form betrays the desire to satisfy the stupid puerility of THE TOURISTS.

/392 cont./

531 peculiar to the villages of the upper Pilcomayo and the Igüembé
184 valley. The decoration made up of broken and asymmetric lines does not go beyond the zone of the Franciscan missions and the Itiyuro region.

/393/

Decline of the Art of Pottery among the Chiriguano

323 Of all the Chiriguano industries the most threatened one
178 is doubtless ceramics. The Chiriguano can claim the glory of
415 having been until recently the last Indians of South America
/Fig. 64 appears here/ to have a pottery which deserved to be
included in the number of beautiful manifestations of this art,
so brilliantly represented in certain regions of the continent.
Today things have changed a great deal. Villages in which
one can still find women capable of decorating vessels with
the mastery of former days have become rare and are limited
415 to a restricted area. /394/ It was in the tolderías of the Timboy,
126 the Great Salado and the Little Salado, in the region of Yumbía
178 and in the Igüembé valley (upper Pilcomayo, departments of
Tarija and Chuquisaca) that I was able to collect the finest
specimens in my collection. Elsewhere it was exceptional
/Fig. 65 appears here/ /see p. 166/ to be lucky enough to lay
my hands on a fine piece; and, if I did have this luck several
times, it was almost always a question of an old vessel pre-
[797] served as if by a miracle. The Franciscan missions which
formerly gave Nordenskiöld and Holmberg such fine specimens
797 contributed less toward enriching my collections. Nothing ex-
323 presses the sad state of decline of the Chiriguano better than
415 what I /395/ could observe in the Machareti mission. After
178 going through nearly all the huts of this large village, which in
[162] normal times has close to 2,000 inhabitants, I could scarcely
acquire five or six yambuí having some artistic value. There
[463] were no longer more than three or four women who still knew
how to hold a brush and they had to /Fig. 66 appears here/ /see
p. 167/ provide for almost the whole village. In a few years
the ancient painted pottery will exist only in memory in the
large village where the famous "Captain" Mandepona lived.

323 This decline has several causes. The first is the state of
415 profound demoralization in which the Chiriguano are found, the
178 total disorganization of their social life, and the increasing
177 influence of the white men, followed by its corruptive effects:
finally, the introduction of manufactured products, first and
foremost gasoline cans.

[126]
[123]

In some villages there are no more potters. The inhabitants of the toldería of Ibopeytí, for example, have to import the painted vessels they need to celebrate festivals. When I wanted to acquire them, it was generally objected that they had been bought and often at a very high price. "You go away and leave us without vessels," they often used to say to me as a half-joking, half-sad good-by after my raids.

/398 cont./

acted as masters and lords of the land, even to collecting a tax from the Chicha Indians. If they did not agree to this, they ate them and even 'had public meat markets for human flesh.' " /Translated from the Spanish./

175
177
648
[567]
[126]

Chicha women certainly shared the fate of the Chané women reduced to slavery by the bellicose Chiriguano and, like them, brought the secrets of their civilization to their masters. On the upper Pilcomayo I acquired a vessel (Plate XXV), a Panpipe (Fig. 67), and a T-shaped ax (Plate XXIII, 1), found not far from the village of Ibopeytí, well within Chiriguano country. These objects reveal either the existence in this place of an ancient Andean population, Chicha or some other one, which the Chiriguano may have annihilated or assimilated, or active commercial exchanges. In the absence of concrete evidence, the influence of the neighboring Andean tribes would have been demonstrated by the very style of the pottery of this region, which more than that of any other point in Chiriguano territory continues a tradition peculiar to the peoples of southern Bolivia.

437
439

Even today the Chiriguano receive from the half-breed descendants of the Chicha silver objects which probably used to be the object of an age-old traffic, and turquoise beads the latter unearth from the /Plate XXV appears here/ /399/ graves of their ancestors. On their part the Chiriguano go to sell ostrich plumes and pieces of basketry to the half-breeds and Quichua Indians.

121
172

Southern Bolivia is very little known from an archeological point of view. The few excavations which have been carried out there testify that the culture peculiar to the Humahuaca valley continues without appreciable modification. The homogeneity of the civilization which flourished in these vast regions will be even more apparent on the day when the decision is made to undertake the systematic study of this immense territory which includes all the altiplano to the north of the Argentinian frontier and the valleys which form the spurs of the Andes at the edge of the Chaco. It is already evident

[Text continues on p. 173]

C A /406 cont./
415 following observation: "The dispersion and evolution of a type
171 of pottery whose /407/ origin must be assigned to the peoples near the Isthmus of Panama can be due only to the Arawak, who spread it among the nations living beyond the Andes, in regions as southerly as the Chaco and the territory of Misiones (1).

> 1. Ambrosetti (2, p. 714) as a matter of fact represents Kainguá vessels with a circular foot. I doubt very much that these pots reproduce a primitive type. They are badly fired, badly modeled, asymmetric, and the foot, which is fastened to the vessel when the latter is finished, is easily detached from it.
>
> These vessels are perhaps crude imitations of European pottery.

A
171 In South America the Arawak have been the propagators of Central-American culture among the primitive tribes located east of the Andes."

C A
415 10. The distribution of vessels with a ribbed belly, of
171 which I acquired a marvelous specimen in the Caipipendí
C valley (Plate XXVI, 2), 2/1 is almost the same as that of the
[126] "compotes," and we can, as with the latter, rank them with the pottery which shows a Central-American origin /Fig. 72 appears here/ and whose dispersion was the work of the Arawak (Jijon y Caamaño, p. 5, Fig. 1 D).

C 11. The vessel of Plate XXVII, 2 2/1 is composed of two
415 superimposed domes: one in the shape of a truncated cone,
171 the other rounded. It comes from Ivu and is the only specimen
C of this form that I encountered in the course of my trip. An
[172] identical vessel was dug up on the upper Paraná by Ambrosetti (3, plate between pp. 256-257, Fig. 5). Similar receptacles are still in use by the Yuruná /Yuruna/ Indians of the lower
C Xingú (Steinen, 1, plate between pp. 266-267). The presence
& of vessels of this type among the ancient Guarani authorizes us
415 to suppose that our specimen from Ivu represents /408/ the
171 survival of an ancient form of Guarani pottery which the
172 Chiriguano have not abandoned.

PA 531 114

/415 cont./

On the other hand, the excavations carried out on the Isla de Tilcara have produced only a few specimens of pottery whose ornamentation was curvilinear. Debenedetti (2, p. 88) considers the latter, for reasons which I cannot accept, as foreign to the locality. Nevertheless, he has reproduced in his book the decoration of two dishes which is made up of facing triangles with volutes (Debenedetti, 2, Figs. 53 and 54, pp. 88-89) (Fig. 79); and he notes the same design on two other dishes which he does not reproduce. In the same publication (Debenedetti, 2, Fig. 113, p. 165; Fig. 114, p. 166; Fig. 115, p. 166) are represented three vessels similar to the Chiriguano yapepo and also decorated with hooked triangles.

C 415 531 171

C 415 171 531

/416/ The most interesting piece in this respect is the

P.A 415 531

Fig. 79. a, bowl from the Isla de Tilcara, whose rim is decorated with facing voluted triangles; b, border of a dish decorated with voluted triangles (Isla Tilcara) (from Debenedetti).

C 415 171 531

yuro of Figure 70 b, reproduced from a drawing given by Debenedetti (2, Fig. 124, p. 175). We have already seen that its form is identical with that of a Chiriguano îru I bought on the upper Pilcomayo. The same is true for the general elements of its decoration.

PA 531

The voluted triangle is found on three other pieces from the Isla de Tilcara (Debenedetti, 2, Fig. 160, p. 217; Figs. 161 and 163, p. 217), which Debenedetti (2, p. 218) classes among the pottery imported to the Isla de Tilcara and utilized by curacas /chiefs/. Our yambuí from the upper Pilcomayo, which from the artistic point of view are very superior to the specimens described by Debenedetti, have often been bought

C 415 531 171 126

C /416 cont./
531 by me in humble cabins whose owners were certainly not
415 curacas, but poor devils who had the luck to have a mother
12 or grandmother who was an expert potter. If the criterion of
[126] Mr. Debenedetti were admissible, the crude pottery and the
[114] fancy vessels which can be bought in every Chané or
C Chiriguano village would be products of two different civiliza-
415 tions. In reality the fancy pottery is used on feast days for drinking chicha; and the other, more humble in appearance, is adapted to daily needs.

P.A
415
531

Fig. 80. Dish from Tilcara and decorated with red voluted triangles on a white background. (1/6 nat. size ±.)

P.A
531
[114]

Besides, the voluted triangle is more frequent on the Isla de Tilcara than Debenedetti wishes us to think. In addition to the examples cited, seven others must be added (Debenedetti, 2, Fig. 24, p. 59; Fig. 30, p. 63; Fig. 40, p. 70; Fig. 48, p. 80; Fig. 165, p. 219; Fig. 165, pp. 219-220). A vessel from Alfarcito in the same Quebrada bears a triangle with volute on the inside rim of the neck (Debenedetti, 4, Fig. 15, p. 29).

/434 cont./

286 171 The Chiriguano have their loom in common with many tribes of tropical America, and they doubtless were already acquainted with it in Paraguay, at least in a more rudimentary form. In some Chiriguano villages looms of the Inca or Quichua /Quechua/ type, that is to say, horizontal ones, can be seen. The warp is then fastened to a small cord along a piece of wood and the cloth is rolled around as it is produced.

286 294 Headbands and belts are woven with looms of a type similar to the one just described. The warp threads are fastened to a loop of cotton attached to a hut post. As the fabric is made it is rolled around two small sticks or two ears of corn attached to the lower end of the warp (for this type of loom, see Nordenskiöld, 10, Fig. 4, p. 175).

29 30 I am reproducing in Fig. 95 a tsumbi headband. These ornaments have now become very rare, and only a few old men still wear them. Our specimen is dyed with natural colors.

29 [178] Every Indian woman who lives outside the influence of the missions still wears the tipoy, that is, a kind of long sheath which they fasten on the shoulder nowadays with a safety pin and formerly [286] /Plate LXXII appears here/ /435/ with a thorn. In olden times these tipoy were woven by the Indian women on looms of the Arawak type. They were of cotton and dyed blue-black. /Fig. [439] 90 appears here./ Today it is almost impossible to find a woman whose tipoy is not made of chamalote, a kind of cheap cotton cloth which the Syrians and half-breeds sell at a high price to our Indians. In the Caipipendí valley /Fig. 91 appears here/ I met two old women who still kept the tipoy of olden times. They would not [126] give it up to me for any price. At Carurutí, an old fellow desirous of striking a good bargain sold me his wife's at a very /436/ high price in order to buy brandy for himself. It was very necessary to celebrate Easter fittingly.

[178] The shirts (tiru-kumbaè) which the men formerly sported exist no more except in the memory of the old men.

[See p. 278--Analyst]

Ce 101 174 /443 cont./ the center of dispersion of the Arawak must be placed to the north of the Amazon, and before the Chiriguano invasion the Arawak tribe of the Chané was established over the whole extent of the territory now occupied by the former.

C 285 171 Beside this technique another exists, known to the Chiriguano since time immemorial and well before their great migration. The English-language ethnographers give it the name of twilled work. No other type of basketwork is so widespread. This technique is preponderant in all of tropical America from the Antilles to Paraguay and in the south stops at the Chaco. The Chiriguano are the only Indians of the Chaco among whom twilled work is in current use. This type of basketry used to exist on the coast of ancient Peru, but its importance there was not great and it appears only in work baskets.

C 285 184 Basketry in wicker work and that in twined work do not have an identical distribution among the Chiriguano. Baskets of the first kind are numerous in the villages of the upper Pilcomayo (Saladito, Salado Grande and Chico, Ibopeytí, and Yumbia) and go as far as the Ivu mission. They stop, or are rare, in the rest of the Chiriguano country, notably in the Caipipendí valley, where baskets of the second type (twilled work) predominate almost exclusively. These are widespread there, and the beauty of their workmanship, the embellishments with which they are provided, put them well above the basketwork of any other zone and even above that of tribes living in regions richer in palm trees.

C [126] In the huts of the upper Pilcomayo I collected several baskets in twilled work, but they were rare there and often incomplete and torn. I had the impression that they had arrived there by way of commercial exchanges. In any case, the Indians no longer plait baskets of this type, and it is possible that their disappearance has given value to the specimens of them which remain. That would explain the absence of any new specimen and the preservation of ancient baskets almost beyond usefulness. Be that as it may, at present the true center of basketry in twilled work is the Caipipendí valley, and that of the basketry of /444/ wicker work, the region of the upper Pilcomayo. Since the living conditions of the C [178] Chiriguano in the missions north and south of the Pilcomayo have undergone deep modifications, I do not know what the respective

/462 cont./

Chapter X

Masks

532 The handsome masks, whose description I shall give
796 further on, are worn during the carnival festivities. Difficulties
[122] with the Bolivian authorities kept me from arriving in the Chiriguano villages at the time when they were taking place. When I finally found myself among my Chiriguano friends, they had emptied the last vats of kāwi and were /463/ in their
[126] normal state. Thanks to the closeness of the feast I was able
[241] to collect the masks published here; ordinarily they are destroyed or used in the fields as scarecrows.

115 My host, Mr. Alberto Torrejon, who lives at Ibopeytí on the upper Pilcomayo in an Indian village, gave me some very interesting details about the ceremonies and merrymaking in which he had just participated. I transcribe them as given.

796 At my approach of any festival, the carnival, for exam-
795 ple, the first act consists in causing the souls of the dead to flee.
789 If this precaution is not taken, the widows and relatives of the deceased will have to abstain from taking part. For the purpose of purifying the air, a drum is beaten, and the whole family /Fig. 120 appears here/ which has lost a member weeps and shouts. When the spirits have cleared out, the drum, in a joyful rhythm, gives the signal for merrymaking.

796 The festival is opened by a man and a woman who, with a stick decorated with flowers in hand, advance toward the middle of the square, followed by all the inhabitants in a long chain. When they have arrived at the middle of the area extending between the huts, the couple plants this sign, thus giving the signal for the festival.

[535] The chain breaks up and small groups form to dance in a ring. Their dance consists in advancing and retreating in triple time to the sound of flutes and drums.

/473/

Chapter XIII

Toys and Games

524 [126] All the toys which Chiriguano parents make for their children or the latter put together themselves are represented in my collections. Nevertheless, I consider it useless to give a description of them, for Nordenskiöld (2, pp. 193-200) has been greatly /Fig. 133 appears here/ concerned with this and has reproduced all of them. Simply as a curiosity I sketch a doll clothed in the traditional tipoy and the hair of which is intertwined with a ribbon in the Chiriguano manner (Fig. 133). A little bag (Fig. 134) contains a whole assortment of tipoy in miniature. Minuscule vessels and baskets (Fig. 109) have been made for the use of little girls, who, in playing, thus learn little by little to become excellent housewives. [868]

String figures. I have never seen children make string figures (cat-craddle /cat's cradle/), but I know they are acquainted with them. At Caruruti an Indian amused himself by executing a whole series for me, some of which were sewn by the Indians themselves onto the leaves of my notebook. According to the figure they wanted to produce, they used both hands or helped with the mouth and feet (Figs. 135 and 136). The "fuli moon" (Plate XXXIX, 3) /Fig. 134 appears here/ was made by my Indian who, having sat down, used feet and hands.

524 121 String figures have extraordinary interest from the point of view of comparative ethnography. If they prove themselves identical in two different regions, they can testify to trade or migrations, like certain games which pass from one region to the other without modifying their character or modalities. Games are the most stable of all cultural elements since they are independent of the environment, race, or way of life, at least in general. It is urgent to collect in South America /474/ the greatest possible number of string figures in order to be able to study their distribution. For this continent we know only a very small number, but this, insignificant as it may be, already allows us to establish some very curious facts.

[Text continues on p. 346]

/476 cont./

123 Drawings. On Plates XCI-XCIII one can see gathered to-
126 gether a certain number of drawings executed for my sake by
532 Chiriguano Indians. In order to obtain them I first approached
several old men, who refused with an outraged air as if I were
123 asking them to do a thing beneath their dignity. A small boy
126 of 12, Consito, two young men, Asensio and José Miguel, and
115
532

524

Fig. 136. Indian executing the mobile string figure called "culo de caballo /horse's rear end/.

123
126
115 a girl, Iwawaei, showed themselves willing to cover the pages
532 of my album with all kinds of sketches.

Consito did not have to be begged: I was proposing to him a game not only pleasant but fruitful, and he had soon filled two pages (Plate XCI, 1, 2, 4, 9; Plate XCII, 2, 4; Plate XCIII, 1, 3, 10). Asensio, my faithful friend, also gave me
115 complete satisfaction. He was a curious individual, and I keep
123 a particularly vivid and congenial memory of him. He was 25
126 to 30 years old and was conspicuous because of his extraordinary
activity and ingenuity. At any moment of the day he could
[322] be seen busy cutting or carving a piece of wood which then
[See pp 355-359-- Analyst]

/476 cont./

115 123 126 322 463 became an ingeniously conceived tool or still oftener a musical instrument. Asensio used to make violins which on first sight appeared to have come from a European factory. It goes without saying that he was the recognized carpenter of the village and the great provider of household articles. When Asensio had understood the purpose which had brought me to his home, he transformed his hut into a workshop for ethnographic objects; and I owe it to his enterprising spirit that I was able to collect many a piece, today no longer in use, which he reconstructed for me.

At the time when I was in his village, Asensio had received big orders for flutes for the coming Easter festival, [532] and I had a good time watching him work. Once an instrument was finished, he would embellish it with engraved animals.

115 126 532 The material on which Asensio (see Plate XCI /see p.355/, 5, 7,, and Plate XCII /see p.356 /, 3, 6) incised his figures exerted an indirect influence on the pencil drawings he drew in my notebook. They stand out by their angular character, but also by their clearness.

José Miguel (see Plate XCI, 8; Plate XCII, 1, 5, 7, 9; Plate XCIII /see p. 357 /, 2, 4, 6, 8, 11, 12), whom Asensio's example had encouraged, asked me to give him the notebook and pencil, and he made me a whole series of drawings which, although rather light and uncertain, sometimes are not lacking [177] in a certain movement. José Miguel had traveled to Argentina: the train and the automobile (which he drew from memory) attest well to his admiration for the /477/ marvels of "Progress" (Plate XCII, 7, 8). Thank God his modernism had not made him forget his mythology, and he was able to draw for me a mythical episode which is to be seen on Plate XCIII, 12, A, B, C: the blue jaguar (yaguarowi, personification of the spots on the moon) is preparing to devour the moon and the sun.

123 126 532 When I had finished with the men, I wanted to have several feminine drawings, imagining that the women would lend themselves willingly to this game since they are the recognized artists of the tribe. All, unanimously and to my great surprise, refused to do it, shouting in the middle of gales of laughter: Aikuaá "I can't do it, I don't know how."

/477 cont./

000 laughter Aikuaá "I can't do it, I don't know how." Only one,
123 a girl, Iwawasei, allowed herself to be persuaded by the promise
126 of a spool of thread. Her awkwardness was not feigned, as I
115 was able to see from the beginning, seeing the embarrassed air
532 with which she took the pencil. Once ready to draw, inspiration was suddenly lacking. She stopped short until I had pointed out a vessel to her to copy. Since her confusion only grew greater, she asked Consito, the small boy who made my first drawings, to help her. He drew the vessel on Plate XCIII, 10, which she began conscientiously to reproduce in series. I protested, and then she made me a horse and on this horse's back a man and a child, then a woman (Plate XCI, 3 and XCIII, 7). I am not very sure that all the drawings she told me she had made were hers, for when my attention was diverted by a visit, she had Consito secretly help her.

532 The drawings the Chiriguano executed for my sake recall not
191 only those of our children but approximate appreciably those which have been collected in various regions of South America, notably among the tribes of the Negro River (Koch-Grünberg, 1); the Taulipang and the Makuši (Koch-Grünberg, 3, Plates 28-32, pp. 128-161); the Indians of the upper Xingú (Steinen, 2, Plates III-IV), (Max Schmidt, 2, Figs. 245-247, pp. 390-396); the Choroti and the Ashlulay (Nordenskiöld, 2, Figs. 63-66, pp. 130-132); the Kaingué (Ambrosetti, 2, Plates I-III, pp. 674-682), etc.

There could be no question of making a comparative study of these drawings, so uniform is their style. The only details which are worth being brought together are those denoting similar psychological characteristics and yet these common traits are not characteristic of a primitive mentality. I should scarcely have to point out the fact that in drawing a woman, a Kaingué Indian proceeded exactly as did two of my Chiriguano artists (Plate XCI, 3 and 7): he began by representing the woman naked, then dressed her.

Chapter Three

Characteristics of the Chiriguano

Introduction

At the end of the nineteenth century, and specifically in the year 1897, the whole Catholic world was invited in advance to attend the great exhibition of sacred art which took place in Turin, beautiful and grand Italian city of the Piedmont. The Pontiff of Rome made his voice heard and the Catholics of the five parts of the terrestrial world made preparations to participate in the literary, scientific, manufacturing industry, and other competitions.

The missions could not fail to take part in this contest of competency: they could not close their ears to the voice of the Supreme Hierarch of the world: with the fervor of the first Christians, with the humility of neophytes, directed by missionaries of all of the Catholic orders and congregations, they prepared an extraordinary contest. In Turin were seen the rarities and products of the missions of China, Africa, Palestine, North America, the colony of Eritrea, Oceania, Patagonia, South America, etc.

Although Bolivia occupies a quite modest place on maps of the world and is slowly being organized to rise to a very great height, it exhibited its products in the said world exposition and was even represented by its tribes. They sent there everything that could be sent from the missions of Guarayos, the missions of Tarija, and those of Potosí. It was then that an Italian photographer, employed in Tarija, went through its missions and those of Potosí, taking pictures of views, panoramas, groups of Chiriguano, families, churches, missionaries, etc. (1).

1. The order to take part came from the Curia Generalicia of Rome and the Most Reverend Father Commissioner in Bolivia disposed that the Colegio of Potosí be united

792
•122

/109 cont./

with that of Tarija because the inhabitants of the missions of both colegios were of the same Chiriguano race.

/110/ The illustration placed at the beginning of this chapter /see p. 165/ is one of the said photographs: it shows a group of Chiriguano women with their festive clothing and adornments, who are ready to attend a public gathering for drinking: it was made in the Boicovo Mission and taken with the others to the exposition. The group of Indian day laborers is reserved for the chapter which deals with work and clothes: both groups show the physical constitution of the race, about which Beltrí del Campano, after the exposition was over, wrote his book; perhaps this gentleman also had seen the four Chiriguano who were brought from the Tarija missions (1).

[113]

1. Notizie intorno ai Ciriguani /Information on the Chiriguano/. Florence, 1901. This is the most complete work that exists in Italy, in view of which I decided to write the present one here where the Chiriguano live.

Physique

114 After having studied the territory that a tribe occupies and consigned to paper what is most characteristic, and, next, having discovered appropriately by means of traditional and historical data or well-founded suppositions the origin and derivation of the tribe, the first thing that is exhibited to the ethnographer and to any observer is the physical body: its proportions, whether large, small, or average, soon strike the eye, the latter, the observer, considers mentally what the former, the physical ethnographer, sees, and begins his narration and then goes on to the character.

/109 cont./

291 Clothing in the fashion of Adam is still seen everywhere. In the towns the men, and almost everywhere the women, are at least dressed from the waist to below the knee, because for work or for coolness the Cutama or tipoy, which can cover them up to the shoulders, is allowed to fall to the waist, the rest being left visible.

Gala Dress

292

For the ancient Chiriguano, the Ambícual, doublet, was fine and festive clothing. This single name includes the Guaupi cangas, bar, the Ambícual, sagum or frock coat, and the Guaupi tumbias, breeches. Because the doublet is an object of luxury, they do not all wear it, its use being limited to the grandees or caciques, to rich men, and to sorcerer. It is made entirely of tanned skins, which are those of the wild boar, peccary, or pygmy deer. They are tanned with the bark of the Cuapa, the astringent acacia or uevil, which contains a great deal of tannin.

Skillful men are needed to make a complete doublet like the one made in the Santa Rosa Mission by the Indian Cachupari, which, when taken to the Turin exposition, was acquired by the Florence Museum, along with the skull that I acquired in Cuayuqui and other objects, such as the Yandugua, a kind of parasol of ostrich feathers, etc., objects which the missionaries of Ponaí sent along with the missionaries of Tarija (2).

2. The missionary who was charged with taking all the things to the exposition and leading the Chiriguano of both sexes, as the program directed, was the late Franciscan Father Dorneo Giannecchini.

/190/

291 294 The crown of the hat is made of four oval parts, as is the brim which surrounds it, sewed with fine cords of the same material, and the edge of the brim is turned upward. The hat has a band of the same material sewed to both sides at the temples to hold it to the throat; a knot or a ring on the band can be used to tighten it.

292 281 The Ambícuai, which lends its name to the whole outfit, is a perfect cassock, but its form is entirely Chiriguano, for it does not hinder the movement of the arms. Its cut is not straight, and both parts are made fast at the chest with two leather straps, which are run through the holes on the opposite side. The cassock in back ends in two points, where there is a kind of ornamentation of the same leather, which consists of short, fine strips, like a tassel. The sleeves are wide, as is the whole garment, and are attached to the shoulder, being open at the armpit so as not to impede the movement of the arms, either in hunting or in war, where the grandees also wear it. In fact, in the photograph taken in Santa Rosa to be [126] sent to the exposition, a hunter and a warrior dressed in this doublet appear outside the circle. In the middle there is a 529 554 562 Chiriguano woman with her crown and adomments as queen of the fiesta, who offers chicha to all who are enjoying themselves (1).

1. The queen is the one who serves the dancers as mistress and patroness of the fiesta. This [128] photograph or figure will not be reproduced in the chapter dealing with fiestas because I could not obtain it.

292 [281] The Timbiao, breeches, is also of leather and is made of four pieces, wider from the waist to the sacrum and narrower from the thigh to the bottom. It is quite wide and comes to the ankle. It is rougher than the rest, but more valued, and they will give anything to have even a single pair. This garment is tied at the waist with a belt or with two strings which are sewed across the entire width of the garment itself.

/198 cont./

301 [562] [554] [527] I am going to end this chapter by mentioning a fancy ornament which has completely disappeared. It is a woman's ornament and is called Aguá, crown, and whoever wore it was called Cuña aguá vaé, crowned woman. The duty of this woman at the public drinking bouts and solemnities was to direct the women's dance, to direct the singing, and to give drinks to the singers and dancers with her own hands. The aguá was a varicolored band up to three meters long, which was put around the head, crossed at the back of the neck, and held on by thorns, needles, or big silver pins, and both ends terminated in tassels of various colors. It was a very striking ornament (1).

● [126]

1. In order to send a complete aguá to the Turin exposition I had to have it made in the girls' school in Santa Rosa. I could not get one in the town; there were none even at that time.

ooo Here is poor humanity without any exact idea of religion and worship, they are zealous and hard-working for the body, but have no concern at all for the soul. Only Christ can restore humankind, and tear away the veil which was obscuring its intelligence, and only the priest and Catholic missionary can teach him the sound doctrine of /199/ immortality and other dogmas, so that with this knowledge he may first seek the kingdom of God and receive the rest besides (1).

1. Quaerite primum regnum Dei et haec omnia adiicentur vobis.

Chapter Nine

Children, Puberty, the Tembeta (1)

881

1. This will deal with the puberty of the girls and the imposition of the tembeta for boys, which is carried out a little before their puberty, so that when this does appear they will have the mark of manhood.

Introduction

797 533 At the beginning of this chapter /see p. 294/ my readers will see a small band of young, luxuriously uniformed musicians with a Franciscan missionary at their side. These [126] are the musicians of San Buenaventura de Ivu, whose photograph was taken on the pastoral visit made by the renowned and wise Delegate General M. R. P. Wolfgango Privaser, illustrious and glorious in the seraphic religion, on the 23rd day of September, 1908. His secretary, the intelligent Father Angel Domáica, was the one who was charged with taking this group and the others in the Potosí and Tarija missions.

All the musicians are Chiriguano boys whose fathers [648] were in the 1892 uprising in the fields of Curuyuqui, half a league away from what is today the mission building, which at that time did not exist. They are the sons of fathers who all wear the tembeta and of mothers who in their puberty underwent the strict tests which I shall relate in this chapter.

175 648 Their fathers declared war to the death, not on the Cross, but on the white, be he Christian or not, because he saw in him a tyrant and hangman, and he wished to cast off the yoke by destroying the one whom he considered its maker. But it is certain that the Indian in his hate and rancor, which he has consistently maintained /illustration appears here/ /217/ against the caray /white man/, did not know how to make a categorical distinction, because not all have bad hearts. If there are some bad ones, real executioners of humanity, there are also very good and compassionate ones, from whom they received and still receive favors.

/260 cont./

527 273 [554 562] The drinking continues for several hours, half in silence with a moderate and placid gathering, with the important men seated on benches or seats and some of their inferiors standing and others sitting on the ground, all of them separated from the women, and these latter, as I have already observed elsewhere, look like so many mortars. When the gathering is well attended, the sight is very pleasant, because anyone who has never seen it will be astonished by the variety of costumes and by the ornaments and cosmetics with which they adorn their faces and feet, and I have in fact seen some travelers stay for quite some time to contemplate this simple custom of those who are called the savages of Bolivia (2).

2. What a pity that there is no photograph of such gatherings! The one taken in Santa Rosa is scarcely a simulacre, since at that time there was not even any chicha for those who formed the wheel or gathering for the dance to drink.

The Dance and Songs

527 533 126 By the time they are quite full, they begin the dancing and singing of the Ayarise. I do not give the Spanish words here, for the real meaning is not known; I could explain them with conjectures and by analogy with other, similar ones, as was done by Father Giannecchini, whose words the Italian del Campano transcribes in his book, but they themselves do not know the meaning. The notes of the Ayarise are written and printed here so that any band that so desires may have a pleasant piece for some capital plaza: risum teneatis amici. The band music was set down by a maestro of the Potosí missions in the year 1903 and touched up this year by the missionary Franciscan Father Domingo F. Regini.

/261/

The Music for the Ayarise

527
535
533
[293]

The signal for the dancing and singing is given by the host, who first makes a short speech to the maestro, who is carrying in his hands a Yandugua, a kind of parasol or umbrella made of ostrich feathers fastened around a long, straight piece of hollow cane. All the feathers have their natural curve outward (1).

[293]
[126]

1. The Yandugua in the Florence museum was purchased in the San Buenaventura de Ivu Mission by the Reverend Father Prefect Friar Romualdo d'Ambrogi, tireless missionary of Potosí.

See the picture on page 77.

527
535

After the speech that the maestro and dancers listen to as if it were a Good Friday sermon in church, the singing and the dance begin. The maestro keeps time with his yandugua, the men dance by moving their feet from the knee, striking the ground without moving from the place they occupy, and the women behind the men with a maté in hand, full of chicha or not. The women take one step backward and another forward, and, not staying in the same place, they walk in time around the men with the formality and exactness of priestesses and hold hands with the other hand, two by two.

527
533

The larger the number of dancers, the more noise they make; there is no staying near them, because the men sing too loud. At a distance, to a person who is used to these songs, they seem relatively pleasant, but at night when one hears them for the first time and does not know what they contain, a thousand things will pass through the mind. Here are the verses of the Ayarise:

[539]

Ayarise, rise -- Mborisese, sese -- Rosa yainde -- Imbaragüe -- Yuma chúrere -- Yuma chuépa -- Soro poco -- Eh! Eh! -- Saisá -- saisá -- Cururu hetesimi pinte -- Hevi sunzu -- Iparanta tapiti -- Cha machá imbarayu -- Imbará, boteriyu -- Eh! Eh! (2).

2. It is perhaps appropriate and my readers may like

/312 cont./

the race can endure for a longer time. The same is true, if, instead of forts, the Government, at less expense, were to found missions in the places which are being explored at the present time; useful hands would be obtained for commerce and for agriculture, without the destruction of the poor humanity.

I finish by giving thanks to the Divine Providence which has brought about here the civilization of the race, utilizing for this purpose its simple and humble subjects, such as the sons of Francis of Assisi, who came to this New World immediately after it was discovered.

To those readers who have followed me benevolently and to those who have charitably criticized my poor writing, I give my sincere thanks and at the same time pray that they will deign to pardon such errors as they might find. Laus Deo.

End of the Work

/Illustration appears here./

/313/ Appendix

121
126

The time and place do not now permit me to draw a map of the entire region that I have described in the first chapter of this ethnography; nor do they permit me to write clearly about the other tribes which populate the eastern part of the Bolivian Chaco, which has recently been explored (1).

1. I believed that a map was indispensable for the "Guide to the Chaco." I drew it recently, and it is soon to be published at the expense of the Supreme Government. I may perhaps get an extra run of 1,000 copies for the present work.

PREFACE.

C
CE
D2

As I mentioned in the preface to the First Part of this work, the expenses of publication have been defrayed by Consul-General Axel A:son Johnson, Esq., of Stockholm, to whom I have taken the liberty of dedicating this, the second part of my book, as a small token of my appreciation of the interest and kindness he has shown towards my South American researches. I also mentioned in the earlier preface that Consul-General Johnson has in every way tried to further Swedish researches in S. America, above all by granting free passages to all the Swedish explorers visiting that continent on board his comfortable and stately ships.

This work is based on collections made by me in S. America, as well as on the study of material in museums and of books (See Part 1). I would remind my readers that these researches have been carried out with the support of Swedish patrons of research-work, notably Arvid Hernmarck, Esq., and Mrs. Ina Smitt.

000

I have to thank several of my friends and colleagues for valuable communications, which I have made use of in one way or another in the present work. These are: Mr. Kaj Birket-Smith of the National Museum, Copenhagen (M. C.), Dr. G. Friederici, Dr. R. Karsten, Prof. Dr. Th. Koch-Grünberg, Director of the Ethnological Museum, Stuttgart, Dr. F. Krause, Ethnological Museum, Leipsic, Dr. J. P. B. de Josselin de Jong, Royal Ethnographical Museum, Leiden, Licentiate Sven Lovén, Prof. Dr. Max Schmidt, Ethnological Museum, Berlin, (M. f. V. B.) and Dr. Max Uhle. Every possible courtesy has been shown me by the Riksmuseum,

Indians in the years 1908, 1909 and 1913, and spent in all 4 to 5 months studying them. In my book »Indianlif» I gave a popular account of them as I got to know them during the Hernmarck expedition in 1908 and 1909. In my last book of travel »Forskningar och äventyr i Sydamerika» there is some information about the Chiriguano. I have brought home to Sweden from the Chiriguano and Chané about 1500 articles which are now in the Riksmuseum at Stockholm and in the Gothenburg Museum. In the Geographical Review I wrote a short article on the migrations of the Chiriguano Indians.

C
Ce
[126]

C
Ce
12
114

A close study of the Chiriguano and Chané civilization by the ethno-geographical method affords points of especial interest, since their mode of life is rather well known, and we are able to trace their history back to the beginning of the 16th century. I have also collected archaeological material from their region. At first I was minded to give an account of this, too, in the present work. I decided, however, that it would be better here only to mention individual finds by the way, and to leave the archaeological material for another publication in which I shall be able also to publish certain archaeological finds made in other parts of Bolivia. This for purely practical reasons.

C
Ce
121

I will here endeavour to make clear how the Guarani-speaking Chiriguano's and the Guaranized Chanés' civilization are composed, what culture-elements they have got from the Whites and from the Mountain civilization in the west, what each brought to the common stock and what they possibly obtained from other quarters.

In this analysis of Chiriguano and Chané manners and customs, I do not intend properly to examine the question as to whence these Indians came to their present abodes. Broadly speaking we know that already. Respecting the Chiriguano migrations there are historical documents extant which evidently show that it was not until the beginning of the 16th century that these Indians conquered

[531]

The Chiriguano, as well as the Chané at Rio Itiyuro, have elaborate pottery of richly varied shapes and often beautifully ornamented. The Chané at Rio Parapiti have plainer pottery. The development of the ceramic art in the various tribes I got to know has differed greatly. The Chama and the Tambopata-Guarayo who are pretty certainly identical with them, are the only Indians I visited who have no earthenware vessels. The pottery of some tribes is a work of art, while others only make the most necessary household utensils. This is not necessarily connected with the tribe's state of civilization generally. Thus in several respects the Yuracáre stand as high as the Chiriguano but the former have very poor pottery; the latter highly developed pottery. If such peoples were studied archaeologically, the former would yield hardly any remains while the latter would yield many beautiful specimens. Wrong conclusions might then be easily drawn as to the stage of civilization of the two tribes.

C
Ce
*171
415
323

Below will be found indicated how many different types of earthen vessels are found among the tribes I visited It will be seen that the Chiriguano and Chané (Rio Itiyuro) have by far the largest number of shapes of earthen vessels.[1]) This is simply due to their having experienced such

C
Ce
[114]
[126]

[1]) On entering a Chiriguano or a Chané hut, one sees a lot of earthen vessels of which the majority are unpainted. All the vessels of various shape and ornamentation which I have collected are from several hundred Chiriguano and Chané huts. It is a selection out of many thousand vessels which I have made and it shows how pottery varies within the tribes. In most Indian huts there will be found but a small number of different types. Unless we bear in mind that the collection is a selection, it leaves the impression that the pottery of these Indians is of much more varied shape than is really the case. What I remark here of my collection of pottery holds good of nearly all collections in ethnographical museums. When we see a cupboard full of various articles from an Indian tribe, we must not think that all these things are used by every family in the tribe. It is properly a collection of all the different objects used by a large number of individuals.

/154 cont./

One might be surprised that a person would want to live in this treeless valley, where one finds only salty, dirty water, but in the Caipipendi valley one need not drink water, for here the maize yields magnificent harvests and there is never a shortage of maize beer. The inhabitants of the Caipipendi valley are wealthy, and if there is famine in other regions, the Indians come from afar to these kinsmen, in order to barter their valuables for maize.

For the collector, too, it is a magnificent valley. We found silver ornaments, silver bowls, finely carved musical instruments, and many other rare articles in this ethnographer's paradise. Stone axes, ruins, diggings /Grabfelder/ of various peoples prove that the Caipipendi valley has long been highly prized by the Indians.

The water has cut deeply into this valley. In the rainy season it probably rains there too.

From Caipipendi I returned over the mountains, through a /155/ valley famous for its hot springs and its beauty, to Charagua, to continue then along the Andes in the direction of Santa Cruz de la Sierra.

It was October, 1908. Not quite a year later, in July, 1909, I again visited the Chaco, after extensive river journeys far beyond, on the border of Brazil. In another book I shall describe these journeys on large, navigable rivers and through virgin forests whose luxuriant green is overpowering.

From Santa Cruz de la Sierra I returned, as was said, to the Chaco in July, 1909. I then traveled first of all by way of the Rio Grande to the Rio Parapiti, chiefly to visit my friend Batirayu.

The Rio Grande is the southernmost tributary of the Amazon River. It comes from the highest mountains of the Andes and flows past Sucre, a city that has long contended with the city of La Paz for the rank of capital of Bolivia. When it emerges from the mountains, it is a roaring, mighty river. Farther down it has an extremely changeable, very little known course. North of Santa Cruz de la Sierra the Rio Grande receives the Rio

/157 cont./ One old woman who was supposed to know Chané very well said she would teach me after she had reached the realm of the dead. Since the Indians in this happy place are not bothered by whites, and not by ethnographers either, the promise of the old woman was not very friendly, Ce 124 197 123 Ce

The Chané use their old language for many expressions that are abusive, for example, karitimisóyti, which they translate as son of a w---e. An invitation to coitus is called pocóne. There are also songs in their /158/ old language, for example, siparakinánoyé, siparakinánoyé, siparakinánoyé, tonéya, tonéya, tonéya, which they did not know how to translate. 195 197 Ce [533] c

From the Rio Parapiti I again visited the Chiriguano chief Taruiri in the Caipipendi valley, where I sought to buy as many old ornaments and other valuables as possible. Besides Taruiri I also visited another chief, Yumbay, an old worthy who was always embracing me and saying: "I am Yumbay." /Fig. 77 appears here./ "Yes, the great, mighty Yumbay," I chimed in, which made the poor reduced fellow feel very flattered. 114 126 C [123] C

From the Caipipendi valley I went by way of Pipi to the mission at Ivu. This lies in an arid, lonely region with little water, near several huge mountains, and the life there must be dreadful. When smallpox was very prevalent in the region, Father Bernardino successfully prevented the disease from spreading into the mission by vaccinating all the Indians living at the place. Father Bernardino is a truly unselfish human being, a genuine missionary. As a result of the vaccination, no one in Ivu died of smallpox, whereas the sinister disease raged frightfully among the whites a few miles from the station. It almost served them right. If anyone died of smallpox, the corpse was laid on a table decorated with paper flowers and a crucifix. Around this the other swine would get drunk and /159/ continue to drink obligos (1) until they were finally lying on the table. 797 164 [114] [133] [312] C [764] C [273]

1. If a person drinks obligo with another, the latter must drink up. C [576]

/170 cont./

The legendary figures and their experiences stimulate the imagination, are preserved and retold. The historical personalities and events are forgotten.

If one looks in Chané and Chiriguano houses, one finds many things preserved which are now no longer in use, /171/ but which they value as mementos of earlier times and often do not want to give up. For example, one sees handsome round pipes, "huiramimbi" (Ill. 80), which have undoubtedly been handed down from generation to generation. They were formerly used in connection with expeditions of war. Old Maringay had kept all kinds of things from olden times. It gave me great pleasure to rummage about in the old man's storage places. I wanted to buy something from him, but felt embarrassed to offer him money for his mementos.

I once found a bundle of fine, old, completely smoke-blackened arrow-points stuck into the walls. "Would you not like to sell them to me?" I asked my old friend hesitatingly. "You shall have three as presents," said Maringay. After this refusal I let him keep his cherished things.

Once I rode away from Vocopay's village in order to look up an old Chané who had an attractive old costume. After some hesitation he showed it to me. He had carefully wrapped it in other material. Like an enthusiastic museum official taking out an old gem, he unwrapped it carefully. One unmistakably saw how dear it was to him. Although I offered him a very high price, he did not want to sell it.

The fact that these Indians love their old keepsakes shows that they have a certain degree of culture. This is true only of the old people, however. The young ones are no longer like that; they sell everything without hesitation. What do they care about a worn-out old festival costume if they can get a red, fluttering scarf and trousers with jacket in exchange! The triumphal march of trousers across the world has also reached these valleys and plains.

The Chiriguano and Chané no longer carry on regular war with other Indian tribes. Occasionally, however, the Chané on the Rio Parapiti make raids on the Tsirakua Indians.

According to Westermarck (2), homosexuality is very

2. Westermarck: Ursprung und Entwickelung der Moralbegriffe /Origin and Development of Ideas of Morality/. Vol. II. Leipzig, 1909.

widespread among the Indians of America. The conception that this is a disgrace is by no means as marked everywhere as it is among the Indians mentioned here.

Ee 839 171 c

/225/ Among the Chané and Chiriguano I did not hear anything about onanism. Among the Choroti, on the other hand, it is said to be practiced by the men who are ignored by the women at a dance.

Ee 833 171 [839]

Perversions in the relationship between men and women, which were common in ancient Peru, do not seem to occur here. The primitive mammal position in coitus is said to be common among the Chaco tribes.

M 832

Mataco gave me a root which they used as an aphrodisiac.

824 Ee 825 773 839

The relationship between human beings and animals is so intimately intertwined in the legends of the Indians that one cannot always determine whether they mean the one or the other. The legends that describe love affairs between human beings and animals are not descriptions of bestiality, which seems to be unknown among these Indians.

Ee 834 171

The sense of modesty has developed very differently among these peoples. It seems to me to depend very much on the mode of dress. None of these Indian men or women of whom I have spoken here regards it as improper, insofar as they have not been completely corrupted or civilized, to expose the upper part of the body. The Chiriguano and Chané women are much more ashamed than the Choroti and Ashluslay when they expose the sexual parts. The latter were very reluctant to undress completely in order to be photographed. I did not even dare propose such a thing to the former.

Ee [126]

Ee /247 cont./

531 The Chiriguano and Chané men are clever in the deco-
322 ration of calabashes (Fig. 126), carve attractive pipes (Fig.
221 120), and know how to tan leather, which they probably learned
177c from the whites.

Ee Among these Indians one does not see much in the way
532 of plastic representations of animal and human figures. The
clay /248/ vessels sometimes have animal shapes. The
C Chané women on the Rio Parapiti fashioned lumpy little dolls
[126] out of wax for their children (Fig. 105). Some of the clay
[437] vessels are painted with animal figures. A vessel from the Rio

532 Itiyuro, which I acquired through barter, is adorned with tree
figures. Occasionally one sees clay vessels in the shape of fruits.

Ee I saw drawings representing human beings and animals
[353] on the walls in a few Chané huts and on a few Chiriguano
Ee calabashes from the Caipipendi valley.

285 As for basket work, the sieves are so popular among the
[439] whites that through trade they are being distributed far beyond
the Chiriguano and Chané region. Otherwise the Chané and
Chiriguano make few baskets. We find basket work in quantities
only among the Indians where the matching-leaved palms begin,
and that is at Santa Cruz de la Sierra.

c /293 cont./
539 South America. Since, however, this is not the proper place
171 for comparative studies with regard to the legends collected by me, I have contented myself with only presenting the material.

c
539 As we have seen, we learn to understand some of the religious conceptions of the Indians from the legends. They are also interesting from the viewpoint that a whole assortment of little features from the life of the Indians is reproduced. They give us a glimpse into their imaginative life.

c
539 Only the content of the legends collected by me, not
114 the form, is usable as research material. I hope that the
126 native South American ethnographers in particular will add to the collection made by me and also write down the legends in the original languages. In order to be able to do this, however, a complete /294/ mastery of them will be necessary. The best method would be to let the Indians tell these legends into a phonograph.

Ee

Longbows. Chiriguano. Bolivia. About 1/6.

On the left wrist they wore a small piece of wood as a protection against the blow of the bowstring.[5]

Curiously enough, the present-day Chiriguano type of bow does not seem to have been exhaustively described by anyone; not even in Schmidt's account of South American bow types,[6] otherwise so exact, is there any mention of the Chiriguano bow. The reason for this may very likely be found in the circumstance that these weapons are said to be of rare occurrence nowadays, and that such few specimens as are still being made, are mostly used as toys and on that account typologically degenerated. Twenty years ago, when I travelled through a part of the Chiriguano country, the bow was, however, not so rarely seen as a hunting weapon as now, and I collected the seven specimens now reposing in the ethnographical section of the Riksmuseum at Stockholm. Beside these, there are two Chiriguano bows brought home by Baron Nordenskiöld, one of which is a toy bow. Two other toy bows that have been brought to Sweden by Nordenskiöld belong to the Gothenburg Museum. This forms the material from which I have compiled the following description of the Chiriguano type of bow.

By their string-fastening arrangement the Chiriguano bows differ from the Chaco-Andean bow types, which latter as a rule have no neck-shaped bow-end projections for the string. On the other hand, all Chiriguano bows that I have studied, even the toy bows, have neck-shaped ends for fastening the string, a circumstance indicating that the Chiriguano bow is no acquisition from Chaco-

[5] de Lizarraga (II, p. 328. From Ed. Nordenskiöld.

[6] Schmidt (II, pp. 1027—1034.

411 [226] two barbed prongs made of some hard wood (figs. 213 and 214). The arrow in fig. 210, which has only one prong, is used both in hunting and [824] for fish-shooting. The Chiriguano also use fish arrows pointed with a number of cactus spines.[1]

The fish spear has in later times become a very scarce implement with the Chiriguano. The only specimen obtained, as far as I know, is the one brought home by me, and now belonging to the Riksmuseum in Stockholm (figs. 213 and 216). Erland Nordenskiöld, who has compiled [114] a map of the distribution of the fish spear in South America, has been kind enough to inform me that the only mention he has come across in the literature, concerning its occurrence among the Chiriguano, is to be found in the account of the Viceroy Francisco de Toledo's unsuccessful expedition against these Indians.[2]

The fish spear I came upon among the Chiriguano in the neighbourhood of San Luis, has a 260 cm long shaft, made of some light kind of wood, very free from knots,[3] at one end of which two barbed wooden prongs are lashed on by means of a thin leather thong. The full lengths of the prongs are, respectively, 32.0 and 31.4 cm, and they project 10.0 cm from the shaft. One of the points has, however, been of a somewhat greater length, but has got blunted off. Both points have seven barbs on their outer sides. To ensure a perfectly firm fastening of the prongs, the free end of the shaft has been wrapped with a piece of cloth, and over this the prongs have been lashed on.

323 I have already enumerated the various kinds of Chiriguano household [462] furniture. Among them, clay vessels hold a very important place. The Chiriguano are clever potters. It is only the women, though, who work at this industry.

In fig. 217 we see a potter's workshop, with a number of finished and unfinished pieces of earthenware. At the hut entrance is sitting a woman, who, with a piece of stick, is giving a finish to a large pot, which has been built up of rolls of clay, and is still unburnt.

[126] In figs. 218—225 I have reproduced some typical Chiriguano clay vessels that I collected at Aguayenda. These vessels are particularly well made. The peculiar rim warts seen on the hanging vessel in fig. 225,

[3] Unfortunately, during the transportation home, the handle was unknown to me, and lost two parts.

/3 cont./ Although
many primordial customs of the Chiriguano have been lost because of the influence of the missions, there have nevertheless been preserved a sufficient number of native objects to make a relatively complete ethnological collection among these Indians.

The Izoró, having abandoned their homes in the regions of the lower Paraguí River during the Chaco War, had been provisionally moved to the environs of the fort of Toledo and the fort "15 de Agosto," where they were living in ranches abandoned by the soldiers. In the environs of the forts they had scratched out large fields for their plantings, but, because of the great drought, they had had no chance to plant, with the result that part of them had already returned to the western region when I was in these forts. When I began my return from Machareti, a large part of them were near the fort of Carandayty. According to the data kindly given me by the Toledo military authorities, the number of Izoró who had come to Toledo and "15 de Agosto" up to June 30, 1935, reached 1,047 adults, 734 minors, and 122 small children, a total of 2,493 souls. On August 24, the end of my stay in Toledo, there were in this fort and in "15 de Agosto" only 503 adults, 141 minors, and 38 small children, most of them having returned to the west by this time.

These Izoró Indians, who speak a dialect of the Guaraní language, indignantly reject the name Chiriguano. They say that they are Guaraní and Paraguayan and that their name is Izoró. Up to now I have not seen this name in ethnological literature and it does not appear in Métraux's work, Cuestión de Límites con Bolivia /Question of Boundaries with Bolivia/, Vol. II. Only on the map of Bolivia drawn by the engineer Franz Germann (Hamburg, 1904) is there noted between the Río Grande and the Río Paraguí the name "Izoszike." The Izoró near Toledo told me that their homes were in the region of the estuaries of the lower Paraguí. Since these Indians rejected not only the name Chiriguano but also the name Chané

E. G. 175 178 167

The preceding historical sketch has shown that we can ascertain the history of the Chiriguano by means of numerous documents over a period of 400 years, up to that epoch so important for their future fate and culture, during which they emigrated from their native country and settled in a distant region. In this new country they found completely different conditions of life. All three factors by which all human life and all human culture are influenced and conditioned, nature, social state, and the spiritual culture of the ambient, were different in the new surroundings, and for that reason during the four centuries of their history they had to modify their primordial culture, which they had brought from their native country.

E. 198 [126]

The products of their present-day culture, dealt with in this publication by means of the ethnographic collection that I brought from Macharetí and Toledo, must be regarded as the result of numerous and different interacting factors. Some of the products of the old culture were kept in a fairly primordial form up to today: others were modified, either being perfected or in some cases degenerating. Many were completely lost because of the modified circumstances, and some were added as a result of the assimilation of outside cultures.

E. 191 174 C [113]

As we have already said, the question of the influences on Chiriguano culture has been extensively dealt with by Erland Nordenskiöld (43). While the Chiriguano received relatively

439

82. Nord. 1, p. 189. Métraux I, pp. 359 and 360.

C 273 [312] Among beverages, besides water, which is scarce in certain regions, chicha (ka'ui) made of maize, potatoes, or algarrobo deserves mention (83). Chicha made from yellow

83. Nord. 1, pp. 234 and 236. Métraux I, pp. 364 and 365.

Ce [273] or white maize is preferred. The chicha from potatoes by the Chané of the Parapití River is considered inferior.

Ce The Chiriguano and Chané ordinarily do not eat from a
264 common pot, but separately and from dishes. Because of this
415 their houses contain many dishes, which are normally made of baked clay (nyá'e), but may also be of wood (sua) (84).

84. Cf. Nord. 1, p. 190.

C Ce I collected various baked clay dishes among the Chiriguano
415 and Chané (cf. Figs. 78-80 /see p.143/), as well as two wooden
[126] dishes, two examples of which the Museum already had, donated by Doña María F. de Casati. I shall deal with the baked clay dishes, along with the other baked clay vessels, in the chapter on pottery, and therefore enumerate here only the wooden plates in the collection.

Although it may be that the shape of the wooden spoons of the Chiriguano and of the Chané may have been influenced in many cases by the shape of the metal spoons acquired from the whites, we must nonetheless regard it as a product of the indigenous culture of South America that in pre-Columbian times had been rather widespread generally among the Andean cultures. Its appearance is quite limited among the native tribes of South America, setting aside the cases where it has been imported by the whites. But it is quite common among the Indians of the regions near Chiriguano territory in particular, for example, among the Tapieté and many other Chaco tribes, such as the Toba, Matako, Churupí, and especially also among the Mojo and, farther to the east, among the Guató. It must be supposed that the Chiriguano received this cultural possession directly or indirectly from the culture of the Andean montaña.

Shells (Ínta) as Eating Utensils

Outside of the spoons mentioned, the Chané-Izozó also use shells as eating utensils.

Ce
415
[824]

As vessels for drinking water and chicha, they above all use cuyas /vessels made from gourds/ (cf. Figures 24-26 and 149; 150; 153) and calabashes (cf. Figures 42 and 151). For the chicha festivities this beverage is ordinarily taken out of the painted baked clay pots in cuyas with designs on them, which are passed around among those present. Of the cuyas that I acquired from the Chiriguano in Machareti many have either incised or pyrographed designs, with which I shall deal in the chapter on art. The cuyas received from the Izozó do not have designs on them, which is easily explained by the peculiar circumstance that the Izozó were at that time living near Toledo. Three of the calabashes received from the Izozó (cf. Figure 42 c) were made from the fruit of the

[126] From Caraguatá. Length 320 cm. (Fig. 102c).
[352]

C The hammocks that I acquired among the Chiriguano in
352 Machareti were all made of wool, as were the hammocks that
286 Métraux saw among the Chiriguano (92). According to

92. Métraux I, p. 470.

Nordenskiöld (93), Chiriguano hammocks are commonly made

93. Nord. 2, p. 12.

C of cotton and only incidentally of wool. Of the three large
286 hammocks in the collection, two (I. A. 448 and 449) were
352 plaited with the technique very common among the Indians of
126 South America, which in my publication on the Guarayú, which appeared in this same journal, I called "double thread plaiting" (Doppelfadengeflecht) (94), while one (I. A. 450) shows the

94. Cf. Fig. 102b /see p.174/.

Ce structure of a piece of weaving. (Cf. Fig. 102a) From the
286 Chané the Museum's collection has hammock I. A. 360, which
352 Mr. Teodoro Rojas acquired among the Indians of the Parapití
[126] River and presented to the Museum. (Fig. 102c.) This hammock was made of caraguata fibers and with a netting technique. According to Nordenskiöld, in addition to such hammocks of caraguata fiber the Chané have others made of cotton, on the technique of which we have no information.
C With regard to the details of these Chiriguano and Chané
Ce hammocks, I refer to the chapters dedicated to the description
286 of the technique of plaiting and the technique of preparing netting.

171

Up to now there has been some doubt as to how these two different types of combs might be distributed among the Chané and the Chiriguano. According to Nordenskiöld (124),

124. Nord. 2, p. 81.

the Chiriguano only have combs carved from a single piece of wood, and the Chané commonly have the type of comb with small sticks and rarely the simple comb carved from wood.

[439]
[126]

The poncho is a garment in common use even today among Chiriguano and Chané men and boys during the cold season. Figure 17 shows a Chiriguano boy wearing a poncho. Because ponchos today, like the fajas, are an article eagerly sought by the whites and are often made to be sold commercially, I tried to collect only ponchos worn by the Indians themselves.

C
Ce
291

In order to explain the above-mentioned measurements we must say that the measurements of length refer to the entire length of the poncho when stretched out. As Figure 17 shows, the poncho is used in such a way that the slit, being in its center,

/31 cont./

C
Ce
291

is brought over the head so that the slit is in the direction of the middle axis of the human body and the middle of the poncho across the shoulders, one part hanging in front and the other behind. Thus the distance between the lower edge of the poncho and the shoulders of the man who is wearing the poncho corresponds to half the length of the poncho when stretched out. Only in the case of two of the Izozó woolen ponchos is half the length equal to the width. I shall deal with the manufacture and decoration of these ponchos in the chapters on the technique of weaving and art.

Ce
29
[286]
[513]
[126]

The Chané of the Parapití River still often wear mantas woven of wool, which they also use to sleep on or to cover themselves with when they are sleeping (138). I have acquired

138. See Nord. 1, p. 202.

nine of these mantas from the Izozó, four of which had been made from ponchos, the slit in the center of them having been closed by sewing. Among the other four mantas which had been made as mantas from the first, the relationship between the length and the width can vary greatly. There are some nearly square and others three times as long as they are wide.

C
291
286
296

From the Chiriguano in Machareti I obtained only one piece of woven material which corresponds to these mantas, and it was already much mended.

C 291 I have already mentioned fajas, used today as belts by the Chiriguano men, in the chapter on cutting and combing the hair and head ornaments. I shall deal with their manufacture and decoration in the chapters on the technique of weaving and art.

Fajas (Izozó: kuakuá in the Collection

Ce 291 [126] I. A. 428-441. (Chiriguano.)
I. A. 738, 803-807. (Izozó.)

Only the Izozó faja I. A. 738, shown in Figure 414, which measures 1.30 m. long and 3.7 cm. wide, differs with respect to the technique of its manufacture and its decoration, which we must attribute to outside influences, from the other fajas collected among the Chiriguano and Izozó. These correspond to one another quite minutely with respect to their dimensions, the weaving technique, and the ornamentation. Moreover, these Izozó fajas have been woven exclusively of cotton and the Chiriguano fajas have been woven exclusively of wool, with the exception of one (I. A. 434), whose warp contains not only cotton threads, but also wool threads. All these fajas are more than 2 m. long. The longest of the Chiriguano fajas measures 2.86 m.; the longest of the Izozó, 2.70 m. The width of the Chiriguano fajas varies between 8.5 and 16 cm., and that of the Izozó ones, between 10 cm. and 19.5 cm.

Ce [178] The women and girls, much more than the men, have preserved their original garb, which consists of a "tipoy." As the photographs in Figures 3, 4, 8, 12, and 14 show, the modern shirt or jacket made of modern material has often been added to the tipoy, but has not replaced it; the wife and three daughters of the Izozó cacique shown in Figure 12 are wearing the tipoy, as are almost all the Chiriguano women shown in Figure 4. Certainly most of the time the tipoy is used as a skirt, the upper part being rolled over the hips like a long belt.

C 301 [126] /33 cont./

Ring (moãkaregua) in the Collection

I.A. 1321. (Chiriguano.) Gift of Father Ayala Solis. Diam. 2cm.

Finally I shall mention here a ring obtained by Father Ayala Solis from the Chiriguano and donated by him to the Museo de Historia y Etnografía del Paraguay. The ring was made of metal from a cartridge shell.

Ce 291 The cacique of the Izozó shown in Figure 12 wears sandals (Chir.: mbipása. Izozó: pʃapá). Generally the men and women go around barefoot. But both sexes use sandals if they are to walk on stony or thorny ground (146).

146. Nord. 1, p. 203. Nord. 2, p. 69, Fig. 23. V. Rosen, op. cit., p. 207.

C 291 17 The region of distribution of the sandal in South America leads us to assume that the Chiriguano did not first receive this item from the whites, but earlier, and that it came from the culture of the ancient Peruvians (147).

147. Cf. Nord. 2, p. 69.

Treatment of Illnesses and Burial

Ce 743 Ce [114] C [114] C Ce 756 171 In the Indian settlement in Toledo there was arranged a small hospital in which the sick Izozó were receiving medical treatment. For that reason I did not have the chance to make investigations among them about the native treatment of the illnesses of these Indians. Nor did I have the chance to make such investigations in Machareti. Therefore, I refer to the investigations /34/ Nordenskiöld and Métraux made on this subject (148), and I wish only to

148. Nord. 1, pp. 216 and 217. Métraux 1, pp. 480-488.

mention here that among the Chiriguano and Chané, as among

8: Schmidt--87 E-5 (1935) 1938 SF10 Chiriguano SF10
Chane SF8

/36 cont./

Ce 857 524

Three other games of skill described by Nordenskiöld are played only by children (163). For one of these, called

163. Nord. 1, pp. 196 and 197.

"sóuki," they use two arrows fitted with maize cobs (164).

164. Nord. 1, Fig. 102.

These two games are played by the children of the Chané of the Parapití.

C 857 524

Nordenskiöld saw the third game, called "parama," played by the children of the Chiriguano in the Caipipendi valley (165).

165. Nord. 1, Fig. 103.

With small round stones, propelled with pieces of baked clay, they try to knock down a button, or some such thing, from a rock.

C 524 126

I obtained from the Chiriguano in Machareti some children's toys which belong to these games of skill.

Toys in the Collection

Bows and arrows are only incidentally used for hunting, and it is therefore difficult to collect them today among these Indians. From the Izozó I was able to acquire various bows and arrows, and from the Chiriguano a small bow for children and various arrows. Among these there are also two specimens for killing birds, provided with a club /maza/ at the tip. Because in particular cases we were often unable to decide if a type of arrow were used exclusively for hunting or for fishing or both, I shall list all the types of arrows together in the following list.

/-8/

Macana in the Collection

411 [126] I. A. 517. (Chiriguano.) Length 64 cm. (Fig. 38).

[171] The wooden macana, acquired from the Chiriguano, is provided at its upper end with a broadening distinctly delimited from the handle (cf. Fig. 38) and in that respect corresponds to the macanas that we know from various Chaco tribes, for example, the Toba, but it does not correspond to the Chiriguano macana shown in a drawing by Nordenskiöld (197).

197. Nord. 2, Fig. 9.

The latter is about the same length, but it does not show the clear broadening at the handle, its upper end being only slightly broader. According to Nordenskiöld, the Chiriguano [224] do not use these macanas except for hunting pigs (198).

198. Nord. 1, p. 183.

Slings (tamomboka) in the Collection

[126]

I. A. 508. Chiriguano. Length of the middle part of net 15 cm.
I. A. 509. " " " " " " 14 cm. (Fig. 36b.)

The two slings acquired from the Chiriguano seem to be [286] exactly alike. They consist of a middle part made with the net technique with caraguata-fiber string which terminates at [284] each end with a cord. One of these two cords ends in a simple knot and the other in a small loop. These slings are like the Chané ones shown in drawings by Nordenskiöld, while the manufacture of the middle part of the Chiriguano sling shown by Nordenskiöld is different (199). The Chiriguano in contact

199. Nord. 2, Fig. 7, A.

the earth of the salt licks called "yukiu" (214).

214. Nord. 1, p. 189. See Métraux 1, pp. 359 and 360.

Making Fire

C Ee 372

Native implements to make fire are little used today by the Chiriguano and Chané. At home fire can generally be obtained from some other piece of burning wood, and for other occasions they commonly provide themselves with modern matches. Moreover, as I have said, the Chiriguano and Chané are not great smokers. One fire-making tool which is still found among them is the strike-a-light. The specimen I acquired from the Chiriguano is different from the strike-a-light of the Chaco tribes in that the tinder consists of a quite thick cotton wick. According to Métraux (215),

C Ee [178] [276]

C Ee [415] [237]

215. Métraux 1, p. 253.

there is also found among them the common form of strike-a-light in which the tinder consists of the fuzz of the fruit of the palo borracho (Chorisia insignis) kept in a container made of a a cow horn or armadillo tail.

C Ee 372 126

/46 cont./ Eric V. Rosen has also shown numerous Chiriguano vessels in drawings in his work already cited (219).

219. V. Rosen. Figs. 218-225.

Métraux describes and shows by drawings a great number of Chiriguano baked clay vessels (220).

220. Métraux 1, pp. 370-374; pp. 382-428; Plates 16-19 and 24-60.

A publication by Felix F. Outes deals particularly with Chiriguano ceramics (221).

C
[113]

221. Felix F. Outes: La ceramica Chiriguana /Chiriguano Ceramics/." From the Revista del Museo de la Plata, Vol. XVI (second series, Vol. III), Buenos Aires, 1909, pp. 121-136.

C
Ce
126
415

Because formerly in the museum of the Sociedad Cientifica del Paraguay we had only four baked clay vessels and a piece of a handle from the Chiriguano, which Doña Maria F. de Casati collected among them and presented to the museum, I had a special interest in filling this gap. With some effort I managed to acquire from the Izozó in Toledo 41 Chiriguano vessels, and from the Chiriguano in Machareti, 55 of them, and with rather more effort I managed to bring them back whole and with their designs in good condition through the long trip to Asunción.

These baked clay vessels collected by me also show great variation in their form and ornamentation. But these diverse variations can be reduced to several groups, according to the purpose for which they were intended.

C
Ce
415

The Chiriguano and Chané baked clay vessels may serve very different ends:

1. To cook foods and liquids.
2. To fry /fritar, literally "to frit"/ foods.
3. To steam maize meal.
4. To carry and keep water.

C
Ce
415

/48 cont./

5. As a container for chicha.
6. To serve chicha.
7. As a drinking container, especially for drinking chicha.
8. To store food.
9. To store anything at all.
10. As plates for eating meals.
11. As a base for the spindle in spinning.
12. As funerary urns.

C
415

The form of these ten Chiriguano vessels intended for cooking foods or liquids is essentially the same. Only the vessel I. A. 412, with a height of 12 cm., is substantially smaller than the other vessels, whose height varies between 20 and 30 cm. Only in the case of the former small vessel is the diameter of the aperture at the top equal to the height of the vessel, while for all the other vessels the diameter of the aperture at the top is less than the height, and in some cases this is a difference of up to 10 centimeters.

/47 cont./

difference of up to 10 centimeters. The neck is clearly distinguished from the globular belly of these vessels by a border of all of these vessels provided with sunken ornamentation. Also the flat part of the bottom is clearly distinguished from the wall by a border. The surface of the belly of the vessels has incised lines produced by rubbing the surface, when still moist, with a maize cob. Only the little vessel I. A. 442 has its entire surface covered with sunken ornamentation.

All of these vessels intended for cooking are fitted with two handles in a vertical position, attached to the upper rim of the pot and coming down to the lower part of the neck. The form of these handles shows some variation which I shall deal with in the chapter on art.

Vessel Intended for Cooking Maize Meal for the Preparation of Chicha, from the Collection

I. A. 595 (Chirig.) Ht. 55 cm. Max. dia. 47 cm. Aperture 36 cm. (Fig. 56).

Large baked clay vessels, which in many areas are still much larger than the specimen brought back by me from the Chiriguano, are used for cooking the maize meal used in the preparation of chicha. As shown in Fig. 56, this kind of vessel is different from the ordinary vessels intended for cooking only by not having handles. The wall of the belly is clearly distinguished from the neck and from the flat bottom. The neck of these vessels also has sunken ornamentation. The vessel shown in Figure 56 is relatively high in comparison with its maximum diameter and with the diameter of the aperture at the top. The vessels for cooking chicha sent to the Chané on the Itiyuro and shown in drawings by Niedermeyer have, in comparison with their maximum diameter and the diameter of their aperture, a much smaller aperture /48/. (???).

2. Vessels Intended for Frying Maize, from the Collection

I. A. 400 (Chirig.). Ht. 14 cm. Max. dia. 23 cm. (Fig. 32a).
I. A. 392 (Isoso). " 10 cm. " " 21.5 cm.

These two vessels are very similar to each other. Both have two small handles on the rim. They differ from one another only in that the division between the flat base and the wall of the vessel is more marked than on the Chiriguano vessel. A vessel very similar to the two described above and from the Chané on the Itiyuro River is shown in a drawing by Erland Nordenskiöld (222). Because Nordenskiöld states that

222. Nord. 2, p. 59 and Fig. 43, N.
22.

this vessel was intended for frying /tostar/ maize, I also consider the two similar vessels in the collection to have been used for that end.

C
415

3. Vessel for Steaming Maize Meal, from the Collection

C
(126)

I. A. 457 (Chiriguano). Height 12.5 cm. Max. dia. 23 cm. (Fig. 32.)

This vessel has some round holes in the bottom, one of which is in the center and the rest in two concentric circles around the central one. According to Nordenskiöld (224),

C
415
252

224. Nord. 2, Fig. 43, N. 22.

who shows in a drawing a vessel very similar to this one, these plates with holes in the bottom are used for steaming the maize meal with which they prepare a dish that they call in Chiriguano "Tuiuiminimo." To do this, they put the plate with the maize meal on the aperture at the top of a pot in which they boil water (225).

225. See Métraux 1, p. 387 and (Plate 13)
N. 1 and 2.

/48 cont./

4. Vessels for Carrying or Storing Water, from the Collection

I. A. 392	Chirig.	Ht.	25 cm.	Max.	Dia.	17.7 cm.	Apert.	4 cm.
								(Fig. 84)
I. A. 393	"	"	32 cm.	"	"	29.5 cm.	"	9 cm.
I. A. 395	"	"	32 cm.	"	"	31.5 cm.	"	13.5 cm.
I. A. 396	"	"	32 cm.	"	"	30 cm.	"	14.5 cm.
								(Fig. 55)
I. A. 589	Izozó	"	34 cm.	"	"	23.7 cm.	"	6.5 cm.
I. A. 606	"	"	34.5 cm.	"	"	18.5 cm.	"	3.5 cm.
								(Fig. 56a)
I. A. 607	"	"	13.5 cm.	"	"	14.5 cm.	"	13 cm.
I. A. 608	"	"	19.5 cm.	"	"	19.2 cm.	"	3.5 cm.
								(Fig. 83b)
I. A. 617	"	"	16 cm.	"	"	17 cm.	"	11.5 cm.
								(Fig. 56b)
I. A. 621	"	"	28.5 cm.	"	"	18.4 cm.	"	3.5 cm.
								(Fig. 83a)
I. A. 761	"	"	40.5 cm.	"	"	27.5 cm.	"	7 cm.
								(Fig. 54)
I. A. 762	"	"	44 cm.	"	"	34.5 cm.	"	7.9 cm.
I. A. 763	"	"	48 cm.	"	"	35 cm.	"	7.7 cm.

The vessels mentioned in the above, in contrast with the cooking pots, have a smooth surface. Also they are not painted. This leads us to assume that they are intended for common use rather than for festive occasions, and we must consider them primarily as vessels for water, which naturally does not preclude their being used on occasion for chicha. Plates XIV-XVII appear here.

The Chiriguano and Chané use vessels like those mentioned above in the chicha festivities, taking the chicha from the large pots by means of them and filling the cuyas /gourd vessels/ or baked clay cups that they pass among those present at the fiesta.

Ce 415 /51 cont./ These vessels have a globular form and are provided with a handle. The bottom of three of them is clearly distinct from the belly, forming a foot. Ce [531] Two of them have designs on the surface; the others are without designs.

C 415 [126]

8. Vessels Used as Receptacles for Food, from the Collection

I. A. 394. Chiriguano. Height 17.5 cm. Aperture 44 cm.
I. A. 401. " " 11.5 cm. " 30 cm.

C [264] Two of the baked clay dishes that I obtained from the Chiriguano in Machareti seem to me to be too big to be considered as dishes for eating, because Nordenskiöld states that (228) the Chiriguano do not eat from a common dish, but

228. Nord. 1, p. 190.

rather each one has his own separate dish. We can assume that these are vessels used as food containers or serving dishes for food before it is placed on the individual dishes.

C [531] The two dishes are without designs. The flat bottom is well distinguished from the wall, which widens upward. The dish I. A. 401 has a rather wide rim which has two handles. Cf. Fig. 53b /see p. 118/.

C Ce 415 [171]

9. Vessels Used for Storing Objects

In contrast to the other Indians, the Chiriguano and Chané use vessels for keeping anything of value. I did not receive from the Indians any indication /52/ that any of the vessels I brought from them belonged particularly to this type. Therefore I refer here to a vessel shown in a drawing by Nordenskiöld with the caption "For keeping knicknacks in" /cited in English/ (229).

229. Nord. 2, p. 158 and Fig. 45, N. 19.

[531]

Because every Chiriguano and Chanés as already mentioned, eats from his own dish, such baked clay dishes are found in great number in the houses of these Indians. Many of them that are intended for ordinary use do not have designs, while others, used on the occasion of fiestas, have designs on their outer surface or on the upper rim of the interior surface, or are provided with small additions.

/53 cont./

12. Funerary Urns

764
415

In the chapter on the treatment of illnesses and burial, I have already dealt with the Chiriguano custom of placing their dead inside funerary urns and of closing these with other vessels. According to Nordenskiöld (232), the large baked clay

232. Nord. 1, p. 278.

vessels used for preparing and keeping chicha also serve as funerary urns. Because among those Indians burial in funerary urns is a direct burial, that is, the entire corpse is placed within the urn, the vessels selected for funerary urns must be large enough to have room for the corpse of an adult. Unfortunately, I was unable to bring such large vessels from [126] Machareti. The largest of the vessels that I brought, 52 cm. and 62 cm. in height, are not big enough for an adult, and in particular their apertures on top, which measure only up to 24 cm., are too small to be able to squeeze in a dead person. Therefore, with reference to funerary urns and their respective tops, I refer to the drawing made by Nordenskiöld (233). Outes

233. Nord. 1, Fig. 113.

has published a Chiriguano vessel with a height of 27.5 cm. and an aperture on top of 27.5 cm., which had served as a funerary urn for a small child. With the um was found a small baked clay dish approximately 6 cm. high (234).

234. Felix F. Outes, op. cit., p. 135 and Figs. 30 and 31.

Outes' data show that the vessels of the Chiriguano can reach quite large dimensions (235). Among the vessels

235. Felix F. Outes, op. cit., pp. 127 and 128.

C /53 cont./
764 described by him there is one which is 92 cm. high and has
415 an aperture at the top 70 cm. in diameter. Another is 110 cm. high and its maximum diameter measures 85 cm. In 1845, in Capirendá, Wedell found such vessels with a height of 120 cm. and a maximum diameter of 100 cm. for the wall of the belly.

13. Various Vessels with No Indication Regarding Their Purpose, from the Collection

I. A. 410 (Chirig.). Ht. 14.5 cm. Max. dia. 8 cm. Apert. 5 cm. (Fig. 81b).
I. A. 411 ("). Ht. 13.5 cm. Length 21 cm. (Fig. 81a).
Ce I. A. 597 (Izozó). " 10.5 cm. Max. dia. 16.7 cm. Apert. 15 cm. (Fig. 72).
415
126 I. A. 599 (") " 9 cm. " " 13 cm. " 10 cm. (Fig. 70a).

C We have no evidence regarding the purpose of these four
Ce vessels which are different in form from the other types of
415 vessels. We must regard the small, double vessel I. A. 411
177 (cf. Fig. 81a /see p.144/) as a special result of the mixture of various, but different cultural elements. The way in which the two small dishes are joined to form a double vessel /54/ corresponds to ancient Peruvian models, while the form of the handle, fitted with a ring, is doubtless an addition of European origin. The whole has the form of a salt cellar and was per-
C haps made to be sold to the whites for this purpose. We must
Ce also consider the vessel I. A. 410 (cf. Fig. 81b /see p.144/)
[439] as merchandise, while the two vessels I. A. 597 and 599 seem to be manufactured for some use in festivities.

The direction in which the threads are twisted by these Indians is generally to the left, while the two skeins which generally make up each thread are usually twisted to the right. See the two sketches shown in Figure 137 /see p.201/. The rather heavy cotton cord stretched out on the loom shown in Figure 104 /see p.176/, used for stretching the warp, is twisted to the right, but it consists of three special threads twisted to the left, which in turn are each made up of two skeins twisted to the right. The strings for the bows for shooting arrows, made of only one skein of animal hide, are twisted to the right. The rule is that all threads, whether they be caraguata threads made by hand or wool or cotton threads made with the spindle, are twisted to the left, made up of two skeins twisted to the right. In examining many threads of the Chiriguano and the Izozó, I found only two exceptions to this rule. Of the two threads wound together on the reel I.A. 413 /I.A. 513 in Fig. 91, p.147/ and each made of two skeins, one is twisted to the right and the other to the left, and the thick wool threads of the warp of the plaited hammock I.A. 448 are twisted to the right, being made of two skeins twisted to the left.

/60 cont./

C 285 Plaited objects of the first type are made in such a way that the strips of one group are plaited with the strips of another group vertical to the first one, in such a way that the strips of the first group pass alternately a certain number of the strips of the second group and are passed by them, and in such a way that the meshes which go in the same direction form lines of steps. The number of the strips passed each time by one strip of the other group is generally three or two at a time, but there are cases in which only one strip is passed each time.

C [126] [513] [415] [291] Ce [415] [126] Among the plaited objects of this type, I obtained from the Chiriguano a large sleeping mat, small flat baskets /canastillas/, sieves, a quadrangular basket /cesta/, and a hat, and from the Izozó small flat baskets /canastillas/similar to those of the Chiriguano and two different kinds of baskets /cestas/. In addition, the Chiriguano and Chané also infrequently use fans for fanning the fire (tapèkua) plaited out of palm leaves (260).

C Ce 285 372

260. Nord. 1, p. 56.

C Ce [824] Métraux has described and shown in a drawing such a fan for fanning the fire. This fan is plaited out of the leaves of the caranday palm in the "Stufengeflechte" style, in such a way that strips of the first group pass alternately two strips of the second group and are /Plates XXVI-XXVII appear here/ /61/ passed by them. The leaflets, separated from the stem, enlace a stick which, forming the upper edge of the fan, replaces the stem of the pinnate leaves of other palms which are used by other tribes of South American Indians in the manufacture of plaited fans (261).

The material of the plaited objects that I have mentioned above consists of strips of palm leaves or strips of cane, and that of the Chiriguano basket I. A. 551, of strips of wood. Because these Indians do not have palms with pinnate leaves available, they C [824] must use the peltate leaves of the caranday, from which comes the difference between the plaited objects of these Indians and those of other tribes.

C
285
[126]

The three sieves that I obtained from the Chiriguano correspond to the flat baskets described above with respect to their exterior form and to the rudiment of the plaiting. They differ from the latter only in that their strips are a certain distance apart and in that one strip of one group always passes only one of the other group, with the result that the ornamentation of the surface consisting of parallel lines which is shown in the little baskets is not produced. These sieves are also provided with handles like the flat baskets of the Chiriguano. A sketch of a Chané sieve shown by Nordenskiöld shows that these Indians also use such sieves (263). Flat baskets and sieves analogous to

Ce
[285]

C
285
291
294
[177]

The technique of the Chiriguano hat (I.A. 554) is not original, but no doubt was received from the whites and perhaps was directly taught to the Indians in the missions. For us the technique of this hat is without interest, except for the fact that this technique is also applied by the Izozó to the making of a type of basket, a specimen of which is shown in Figure 98b /see p. 158/. The manufacture of the hat begins at the center, and the strips, the beginning of which is plaited, are augmented by the addition of other strips. See Figure 99 /see p. 158/. The style of plaiting is like that of all the other objects of this kind among the Chiriguano and Chané, so that one strip of one group always passes two strips of the other group.

/64 cont./

There may be variations in these braids according to the difference in the number of skeins plaited and the number of strips which are passed each time by one strip of the braid, as Figures 139-141 show /see p.201/. The greater the number of skeins in the braid, the more the form of one string of the braid takes on the appearance of a band. Cf. Figure 32 a and b /see p. 62/.

Ce
Ce
[171]

To the second of the four kinds of plaited objects into which all the plaited objects of the South American Indians can be classified belong those which are plaited in such a way that one row of sticks, threads, or similar things are united so that a double thread passes the row, continuously or at certain intervals, and in such a way that the two individual threads of the double thread encircle in each rotation one or more of the little sticks or threads of the row.

C
126
352
513
286

Among the objects plaited by this technique there are two Chiriguano hammocks and one Izozó saddle covering in the collection.

126

Objects Plaited with Double Thread, from the Collection

I. A. 448. Hammock (Chirig.). Wool. Lgth. 2.60 m. Width 0.75 m. (Fig. 102b and 109.)
I. A. 449. Hammock " " " 2.05 m. " 0.60 m. (Fig. 110.)
I. A. 844. Saddle covering (Izozó) " 1.21 m. " 0.57 m. (Fig. 103b and 129.)

C
352
286

The threads of the hammocks mentioned above are made of wool and that applies not only to the warp threads but also to the double threads. The manufacture of these hammocks is explained in two schematic drawings shown in Figures 109 and 110 /see Figs. 127 and 128, p.190/. The diagram in Figures 109 /Fig. 127/ shows the place in hammock I. A. 448 where the double thread begins to pass through the row of warp threads. The arrangement of the warp threads can be explained only by the manner in which a warp of one continuous thread was made first and in the form of a sleeve, /65/ as the warp of weavings done on a loom

/65 cont./

415 Wooden Hoops for Storing Possessions, in the Collection

[126] I. A. 580. A pair of hoops (Chiriguano). Diameter 53 cm.
I. A. 581. " " " " " " 51 cm.
I. A. 582. " " " " " " 46 cm.
I. A. 583. " " " " " " 43 cm. (Fig. 41).
I. A. 584. One hoop " " 48 cm.

In the Chiriguano houses in Macharete I found hanging wooden hoops, which, usually in pairs, served for storing various [285] possessions of the Indians. The circular area of the hoops is filled in with strips of cane that are stretched across the hoop and interwoven as Figure 41 shows. The hoops are provided with strings or strips of leather in order to be hung in the houses (268).

268. See Métraux I, p. 471, Figs. 126 and 127.

285 Modern Plaited Objects in the Collection

126 I. A. 503. Basket (Chiriguano). Diam. 18 cm. Height 12.5 cm.
I. A. 550. " " " 27 cm. " 13 cm.
I. A. 552. " " " 31 cm. " 23 cm.
I. A. 553 Flat basket " " 56 cm. " 16 cm.

/66/ I obtained from the Chiriguano some baskets whose technique is completely different from the technique of the [171] baskets described above. They are so similar to the baskets commonly used by the Paraguayans that we must consider them products of an absolutely modern craft, and it is not necessary 285 for us to deal with their technique. Nordenskiöld and Métraux show in sketches and describe such baskets of the Chiriguano, among which some have handles and others lids (269).

Max Schmidt, Die Paressi-Kabichí, Ethnologische Ergebnisse der Expedition zu den Quellen des Jauru und Juruena in Jahre 1910 /The Paressi-Cabishi, Ethnological Results of the Expedition to the Headwaters of the Jauru and Juruena in the Year 1910/, Baessler-Archiv., Vol. IV, No. 4/5, 1914, pp. 214 and 215.

similarity among all the looms known up to now among the Aruaco /Arawak/ tribes. The loom that I obtained from the Izozó corresponds in form and construction to the Paressí-Kabichí loom described and shown in a sketch by me, but it demonstrates, discounting some insignificant anomalies, a perfection which Nordenskiöld has already mentioned (271).

/67 cont./

P Ce 286 In order to be able to form easily by a single manipulation the second formation of the warp threads, in which the even threads, which were below in the normal formation are brought up, passing the odd threads, the mechanism represented by the diagram in Figure 106 is constructed. As this figure shows, this mechanism consists of small loops of cotton thread which encircle the even threads of the warp and are tied to one another. This Izozó mechanism is different from the corresponding one of the Paressi-Kabichí loom, in that it is not provided, like the latter, with a small stick which serves to join the aforementioned loops to one another.

Ce 286 /68/ By pulling the warp its position can be varied so that the part of the warp which is being worked is always at the proper height and on the front side of the loom. This can also be effected by moving the lower horizontal pole of the loom frame, which the warp threads are always pulling.

In order to be able to pass the woof thread alternately through the two divisions of the warp threads formed by the string and loops mentioned in the foregoing, these divisions are opened by means of a kind of wooden sword, of which the collection has five specimens in addition to the two which go with the loom. Two of these measure more than a meter, since they are intended for working with much larger looms than the one shown in Figure 104. This implement at the same time is used to fix the woof thread to the finished part of the woven material after it has passed through the warp.

The shuttle, by means of which the woof thread is passed through the two divisions of the warp threads alternately from left to right and from right to left, consists of a simple little stick on which the thread is wrapped. In the list of objects in the collection, two specimens of such shuttles from the Izozó are mentioned, in addition to the one which belongs to the loom. See Figures 91 d and e.

C Ce 286 126 In addition to these implements I acquired two others in the form of a bodkin and made of wood, which are used to arrange the warp threads. One of these is from the Chiriguano, and the other from the Izozó. Combs, which were used by the ancient Peruvian for this purpose, are not used by the Chiriguano or the Chané.

/68 cont./

C Ce 286 174 177 In addition to this usual type of loom, there can also be found among the Chané and Chiriguano other special types which correspond to the ancient Peruvian types of looms for weaving bands. The fact that the mechanism of these looms makes possible the formation of more divisions of the warp threads, makes more variations in the ornamentation possible. Nordenskiöld shows such a Chiriguano loom in a drawing (273). No doubt this kind

273. Nord. 2, Fig. 55, N. 4.

of loom is a product of the influence of the culture of the ancient Peruvians.

C Ce 286 For different purposes, very different weavings, most of which have already been mentioned in the chapter on clothing, can be made with a loom provided with a warp in the form of a ring as described above. With regard to the measurements of these fabrics, I refer the reader to what I have already said in this respect. The material of all of these woven fabrics consists of cotton or wool threads.

I.A. 840. " " " " 104 cm. " 36 cm.
I.A. 841. " Wool " " 92 cm. " 46 cm.

Ce Of the three tipoys in the collection acquired from the Izozó,
291 one (I.A. 820) consists of a fabric in the form of a sleeve made
286 with the warp in this form. The woolen tipoy (I.A. 832) was lengthened by sewing together two such woven pieces, one beside the other. The structure of the weaving clearly shows the thread which was extended between the two vertical poles of the loom before making the warp, and which remained in the cloth. Tipoy I.A. 838 is not typical and consists of a flat piece of weaving whose two facing edges were sewed together.

C With regard to the making of ponchos, we must mention
Ce that those of the Chiriguano consist of two pieces of woven ma-
291 terial sewed to each other in the direction of the slit of the
286 poncho, while Izozó ponchos most often consist of a single piece of weaving made across the entire width of the loom and therefore do not show a seam in the middle part such as Chiriguano ponchos show. From the stiff edges in the direction of the woof, it can clearly be seen that the special mechanism

[482]
[352]

With regard to their exterior structure too, the bands with which many of the carrying nets (of the Izonó and some of the Chiriguano ones) and one Chiriguano hammock are provided are similar to the weavings. But these /Plates XXXII-XXXV appear here/ /73/ objects are made without any special mechanism for making the divisions of the warp threads.

Figure 125 shows the structure of the band of the net I.A. 768. (Cf. Fig. 133 /see p.700/.) The diagram shows the way in which these bands are made. First the longitudinal threads are stretched in a way similar to the manner of stretching the warp threads of common weavings between the horizontal poles of the frame of the loom, but without using the special thread extended between the two vertical poles of the loom. Then they pass a transverse thread, which corresponds to the woof thread of common weavings, through the two rows of longitudinal threads alternately from the right to the left and from the left to the right, in such a way that this thread is left alternately under one thread of the back row of longitudinal threads and on top of one thread of the front row. Thus the manufacture of these bands and of hammock I.A. 450 is different from that of common weavings principally in the fact that the woof thread passes simultaneously through the threads of the front side and of the back side of the warp. Sundry irregularities in the course of the threads of the warp show that weavings of this kind have been made without using a mechanism for making the divisions of the warp threads.

Ce [227]
C 411 286

From the large size of the mesh of nets I.A. 560, 705, and 794, it follows that they are hammocks. Because in Chiriguano and Chané territory there are generally no fish except small ones, nets for fishing must have considerably smaller meshes.

Of the Chiriguano nets for carrying loads, two are made of wool and one of these has a band like most such nets from the Isoné. The rest of these nets from the Chiriguano and the Isoné are made of caraguata thread. Some of them have a rather small mesh, but among them, of the Isoné [illegible] with big mesh are not rare.

C 286 352 297 126

/74 cont./

small mesh, but among those of the Isoró those with big mesh are the rule. Thus the mesh of the Isoró nets used for carrying the large water jars is also very large. Most of these Isoró nets have a special band that goes over the forehead of the bearer. The structure of these bands, which are made of caraguata, wool, or cotton, have already been described by us in the chapter on weavings. Cf. Figure 133 /see p. 300/ and the diagram shown in Figure 125 /see p. 196/.

The collection has two net bags from the Isoró which are made in such a way that the whole rectangular net is folded in the middle and the pieces which are on top of one another are laced together with a thread on the two longitudinal sides.

In the way described in the foregoing they also make the net of the fishing implement I.A. 794 described in the chapter on fishing and shown in Figure 35. Because this implement is used to catch small fish, the net has very small mesh. The slings described among the hunting implements are also made in the same way.

/75/

Burden-carrying Net Made by the Technique Called "Knotennetzstich" in German, But Using the Knot Called "Sheet Knot" in English from the Collection

I.A. 572. Net for carrying loads (Chiriguano). Strips of animal hide. Length 0.85 m.

This net is made like the nets described in the foregoing, made of knots, but the knot used in the type called "sheet knot" in English and "Schotenstich" in German. This knot is shown in Figure 138, c and d. According to Nordenskiöld (277), the

277. Nord. 2, p. 164.

Chiriguano also have fishing nets which are made using this type of knot.

/75 cont./

Nets in the Collection That Are Made with Loops and without the Use of Knots

I.A. 565-566.	Net for carrying loads (Chirig.).	Lgth.	0.90 m. 1.80 m.
I.A. 567.	" " " " "	"	1.15 m. (Figs. 134 and 143.)
I.A. 568.	" " " " "	"	1.20 m. (Fig. 144.)

From the Chiriguano I obtained several nets for carrying burdens, which are made without using knots, by connecting the thread in the fashion illustrated by Figures 143 and 144 and which is common among many tribes of the Chaco, as happens among the Tapiété, Matako /Mataco/, Toba, Chorote /Choroti/, and Churupí /Chulupi/.

The great number of nets that I acquired from the Izozó are made with knots without exception, and we must therefore assume that these Indians are not familiar with or do not use the technique of making nets with simple loops and without applying knots, and that this technique, called "Schlingtechnik" in German, is used only by the Chiriguano or a part of them. Nordenskiöld does not mention this technique among the Chiriguano, and in the synoptic outline in which the several techniques of making nets are illustrated the Chiriguano are not mentioned in Column 5 among the Indian tribes which use the technique of making nets without applying knots. Of the burden-carrying nets made of caraguata thread that I acquired from the Chiriguano, ten are made without knots being applied, by the technique called "Schlingtechnik," and only seven by applying knots by the technique called "Knotentechnik." We can therefore assume that this part of the Chiriguano at least uses the technique of making nets without applying knots, although this opinion is contrary to that of Nordenskiöld, who says (278) that

278. Nord. 2, p. 116.

all of the nets made by this technique found among the Chiriguano and the Chané were acquired from the Chaco Indians.

[296]

/76/ Sewing

With the acquisition of European clothes, naturally the sewing of these clothes to make and mend them became general among the Chiriguano and Chané. Modern sewing needles are an article eagerly sought by them today. But undoubtedly these Indians had already known the technique of sewing with a needle with an eye for a long time through their contact with the culture of the ancient Peruvians. Although the native textiles are, in most cases, made in one piece, needlework coming from other cultures is often added to the native technique of these textiles. I mentioned that a large Izozó tipoy is made of two smaller tipoys sewed together. The ponchos of the Chiriguano in Machareti are made of two pieces sewed together. The four edges of the Chiriguano and Izozó ponchos most of the time are turned and sewed to the rest of the fabric. In the making of the bags for carrying burdens, especially the double bags for loading draft horses or burros, sewing is used.

C
Ce
294

C
Ce
415

Among the cuyas that I obtained from the Chiriguano and Izozó there are several which show breaks mended by sewing. See Figure 25a /see p. 51/. The two diagrams shown in Figure 130 a and b serve to illustrate the way in which this sewing is done, with cotton thread on the two Izozó cuyas I. A. 666 and 667, and with fine wire on the Chiriguano cuya (I. A. 460). The cuya I. A. 667 shows two such repairs done by sewing.

On the Cooking of Meals

Most of the Chiriguano and Chané utensils used /Plates XXXVI-XXXVII appear here/ /77/ for cooking meals have already been mentioned in the preceding chapters, such as pots for cooking food and for fermenting chicha, dishes with holes in the center of the bottom for steaming maize meal, vessels for frying /fritar/ maize, wooden mortars with their pestles, and sieves. For frying /fritar/ meat or fish, the Chiriguano and Chané do not use the quadrangular or triangular stands which are so common among other South American Indians, but instead simple wooden spits (282). Also, as we have already said, the grater for grating mandioca roots is not found among these Indians.

C
Ce

Ce
402
191
413

We must still note that the Chiriguano and Chané transport fish in the same way as the neighboring tribes of the Chaco, by stringing them on a cord provided with a big wooden needle (295).

415

Most of the objects that serve for storing things have also been mentioned in preceding chapters, such as the various kinds of baskets and the wooden hoops which are hung in the houses for storing sundry things in them. The net bag and the carrying net do not serve only for carrying, but also for storing things in them. Baked clay vessels are not only used for storing liquids, but are also used for storing many other things which have a special value or are old memorabilia of the family (296). Furthermore,

296. Nord. 1, p. 179.

Flutes and a Whistle in the Collection

I.A. 491. Flute, "sereré" (Chirig.). Wood. Lgth. 17 cm. Width 2.7 cm. (Fig. 33b.)

I.A. 492. " " " " " 20 cm. Width 2.5 cm. (Fig. 33a.)

I.A. 493. Flute (Chiriguano). Cane. Length 43 cm.

/79 cont./

534 I. A. 494. Flute (Chiriguano). Cane. Lgth. 41 cm. (Fig. 34a.)
[126] I. A. 495. Double whistle " " " 33.5 and 7 cm. (Fig. 34b.)

[126] From the Chiriguano in Machareti I acquired two different kinds of flutes, the ones made of cane and the others made of wood. The two wooden flutes I. A. 491 and 492 (cf. Figs. 93a and 93b /see Fig. 33a and b, p. 89/) are of particular importance because of their similarity in form, and in the case of I. A. 491 of decoration as well, to a special kind of balance beam of the ancient Peruvians, and for that reason they have already been dealt with several times in ethnological literature. These two flutes are doubtless quite old specimens which per-
[322] haps had already been used by several generations. They are called "sereré" by the Chiriguano, and they are of hard wood bored from one end to the other. In the middle of the upper edge of the lozenge of the apparatus, there are two small
[301] perforations . A similar flute shown in a sketch by v. Rosen (299)

299. V. Rosen, op. cit., p. 220.

shows that these perforations serve for a string to pass through, in order that the flute may be worn as a chest ornament.
534 Nordenskiöld (300) has already called attention to the surprising
174
191

300. Nord. 3, pp. 187 and 188.

resemblance between these flutes and a special form of balance beam of the ancient Peruvians. These, numerous specimens of which are known, are no doubt classified as balance beams because of the fact that on some specimens /80/ the cord which passes through the horizontal perforation and which has at one end a weight and at the other end a loop, or some such similar thing for holding the objects that are to be weighed, has been preserved. V. Rosen, describing and showing in a drawing one of these Chiriguano flutes, which is like flute I. A. 491 except that it still has the cord which passes through the two holes on the upper

/fn. 1 cont./ said chanes each pueblo had its name, although all were one race; asked how they came to speak guarany and where he knew the said garçia, he said that the reason he spoke goarany was that in times past, before garçia came from brasil /Brazil/ to the said guaranys, there was a great gathering of said guaranys in the port called ytatyn, in order to go to search for the metal, and that passing through their land at night they came upon their houses and killed many of them and took their women and children and brought them to the said port of ytatyn, and while they were slaves of the said goaranys in the said port, the said garçia passed through there, with whom he and two other brothers went in search of said metal with the said guaranys; asked if he went and traveled with the said Garçia until he returned, he said yes; asked how far the said garçia had gone and where he got the metal that he carried, he said that he had gone as far as the race that they call payçunos, and that the chanes and the said payçunos gave him the said metal and that he had returned from there because he learned that a race called çorocotoquis were having a great gathering against the said garçia and those who went with him, and he said that they returned to get more xrisptianos in order to return with them for the said metal ..." /translated from the Spanish/.

C G 175 127 114 167

This testimony and some other indications corroborate Gandía, who in this study gave evidence not only of vast erudition but also great sagacity. There is nevertheless one point on which I do not agree with him. The documents alluding to the migration of the Guarani all speak of it as a recent event whose details were

/315 cont./

G 114 127 175 167

/fn. 1 cont./ still present in everyone's memory. Even if we accept Garcilaso's version and make that event go back to the reign of Tupac Inca Yupanki, it is still no less certain that it could only have taken place in the last decades of the 15th century. It is indeed at this time, according to Balboa, that the emperor Tupac Inca Yupanki would have reigned. (See Nordenskiöld, 6). In this case the first Guarani migration would have preceded García's trip by about 50 years. Why then does Gandía, who himself gives us this figure, consider it more probable that this invasion took place more than a century before the Conquest? When I personally submitted to Mr. Gandía the reservations I had on the subject of the date he was assigning to the establishment of the Guarani at the foot of the Andes, he answered that he had taken as a basis for this evaluation a passage from Lozano (Descripción chrorográfica...) and Mendiburn (Diccionario Histórico Biográfico del Perú...). According to the latter the Inca Yupanki would have died in 1453. I shall reply to this objection by stating that the evidence of Lozano, who was satisfied to copy Garcilaso, has no value; and as for Mendiburn's calculation, I do not grant him any credence.

One single fact remains certain in this controversy: The Guarani had begun their migratory movement toward Peru some years before García's adventurous trip.

G 175 167 [114]

/316/ establishing. Neither was Alejo García's expedition the determining cause of the great migration of which Díaz de Guzmán (p. 29) speaks thus:

"Following these events (García's trip) the Indians of the Province of Paraguay met together with their caciques and

/319 cont./

there, for the Indians are excellent farmers. In the course of the war with these populations the Indians of his tribe, he added, destroyed and depopulated numerous villages, but doubtless they had already rebuilt them. He was asked whether there were large rivers and springs along the way. He answered that he saw rivers, but that they did not have much water; however, there were other very deep ones, springs, lagoons, game, deer and tapirs, fruits and honey. He was asked whether at the time his people made war on these tribes he had seen any who had silver and gold. He said that in the villages they pillaged there were many silver and gold plaques, /320/ labrets, ear ornaments, bracelets, crowns, axes, small vessels; and that it was all taken away from them when they were put to rout. Those who escaped were able to take along some silver plaques, beads, labrets; but the Guaxarapo stole them when they tried to pass through their territory and killed them. Those who settled in the bush had a few, and he had heard it said that at the present time it was the Xaray who possessed this silver. He declared he had seen the Xaray, when they war upon the Indians, take out silver plaques which they had carried away and plundered in the interior lands."

Against this bundle of proofs attesting to the recent character of the Guarani migration, what is the value of Garcilaso de la Vega's vague affirmation (Vol. II, pp. 279-281) which some people want to oppose to it? According to this kind narrator, the Inca Yupanki would have undertaken the conquest of the Chiriguano country for the virtuous purpose of converting them to the good natural religion of the Peruvians. The Chiriguano would have been veritable monsters, feeding on human flesh, uniting *by chance, living without fire or law*, burying the bones of their dead in caves or in the hollows of trees. In a word, except for anthropophagy and the mention of the maloca (1), there is nothing in the picture of the

1. The description Garcilaso (Vol. II, p. 281) gives us of the large house of the Chiriguano is perfectly exact and very

/320 cont./

C 175 342

interesting: "they make a very big dormitory and, within it, as many small rooms as there are residents, and so small that they do not have room for more persons, and it is enough for them, because they do not have furniture, nor do they have wearing apparel and hence they go about naked." /Translated from the Spanish./ These facts agree on every point with those of the Relaciones geográficas, etc. (Vol. II, Plate CIV) and of Lizárraga (Vol. I, p. 259) on the same subject. The Guarani, just like the Tupinamba and other Tupi tribes, lived in maloca, gigantic halls capable of containing more than 150 persons and which often in themselves formed the village. The existence of this type of dwelling among the Chiriguano in the 16th and 17th centuries constitutes new proof for the recent character of their migration. In the 18th century we find them already in possession of the small rectangular house which they still have now and where one single family lives. (See Métraux, 2, p. 51.)

C [114] [113]

C [171]

C [174] [167]

novelist Garcilaso which might allow one to suppose that he really knew who the Chiriguano were. As for this conquest by the Inca, it would have been barely an attempt at conquest... Garcilaso confuses the Chiriguano with all the tribes of the eastern slopes of the Andes whom he had vaguely heard mentioned. Let us note that he is the only one to attribute this expedition to the Inca Yupanki, while the other chroniclers, better informed, are satisfied to say that the Inca Yupanki made an expedition against the Antis, probably around Cuzco. Unfortunately the vogue this pleasant writer enjoyed at a time when the history of America was still in limbo bluffs some modern critics into believing him, and they go so far as to prefer one of his unwarranted affirmations to the serious /321/ and precise evidence of chroniclers who get their information at first hand and from reliable sources.

/333 cont./

Chapter II

Agriculture

241 The Chiriguano, like the Guarani and the Chané, their ancestors, are excellent farmers, and the working of the soil represents their principal occupation and their great concern.
243 For them corn is of prime importance; it constitutes the basis
[273] of their diet, for it enters into the preparation of most of their dishes and in addition gives them their preferred drink, chicha or kāwi.

[132] The sandy lands of the western Chaco and its climate,
[134] hot and dry a great part of the year, but also rainy during the summer months, seem to be particularly suitable for this grain. I have never seen such beautiful fields of corn anywhere. The ears are large, well filled out /334/ with kernels, and extremely tasty. The Bolivian half-breeds and settlers who are coming in greater and greater numbers to take the place of the Indians devote themselves like them to the growing of corn, which, with cattle-raising, is their main resource.

114 My trip to the Chaco, which took place from the month
243 of February to the month of June, did not give me a chance to
[101] be present at the sowing which is done at the beginning of the rainy season. For many details I shall therefore be forced to
[127] refer to Corrado (pp. 42 and 48), Campana (pp. 96-98), Nordenskiöld (2, pp. 181-184, and 10, pp. 23-24), to Nino (pp. 237-241), and Rosen (1, p. 205).

241 When a Chiriguano wishes to cultivate a new piece of
243 ground for himself and his family, he scours the environs of his village looking for a spot which may suit him and which is, in addition, easily irrigable. This condition is generally fulfilled by the lands at the foot of a hill or rising ground. The rain water which pours down there assures them of fertility.

/105 cont./

797 setbacks, and endured the bitterness of having some captured
361 by the savages, but the establishment of the town is now an accomplished fact. It has a pretty church, consecrated at the end of July, 1908, and the only thing lacking is a priest in residence to attend to them spiritually with great care, because Machareti is quite far for this widespread parish (1).

1. The Christians who explored the territory of Carandaiti received the land promised; there is no potable water other than that of the ponds, which are in danger of being emptied. The preservation of this town should receive the attention of the Government of Bolivia for the sake of commerce, the cattle industry, transportation, and the prospect of new explorations to the east.

128 /106/ With the brief summary which I have made with
127 reference to the missionaries among the Chiriguano and to the towns of whites built in the same region, presided over by the Franciscans of Tarija and Potosí, I bring an end to this second chapter, in which several opinions regarding the origin and point of departure of the Chiriguano for the region which they occupied, and with slight differences occupy at present, have been expressed.

There is no invention in it; by means of patient verification from different persons at different times, by consulting numerous authors, who, by study, reference, or in passing, have left something in writing, I have come to learn certain facts which, if they are believed here, are also believed in other places, and I have concluded that not all of it could be a fable, and as I have heard them told, so do I present them to my readers. This is the chapter which has concerned me most, and I do not know if the time, vigils, and the sleep of which my eyes have been deprived have been well employed; be that as it may, the public now has it.

/324 cont./

127 128 Some of the lithographs for Etnografía Chiriguana have been reproduced from the Anthropologie Bolivienne of Doctor Arthur Chervin, as well as others from the work of Señor del Campano, and the rest from photographs which I was able to get from some amateur photographers among the Franciscans.

Some of those of the first-named author and all of those of the second were reproduced from the album which is kept in the Potosí missions and in the Franciscan Colegio de Tarija.

If the author of the Etnografía had had the necessary time available and had been able to rely upon a collaborator, it would have been easy, most easy, to have reproduced with photographic apparatus important scenes, beautiful landscapes, enchanting panoramas, high and thick palm groves, immense beaches on great rivers, and other innumerable beauties which exist in the region. In a second edition all this could be done, if the Supreme Government would make available the necessary funds so that a scientific tour might be made through the entire region in the company of a photographer.

PREFACE

C
Ce
D2

As I mentioned in the preface to the First Part of this work, the expenses of publication have been defrayed by Consul-General Axel Axson Johnson, Esq., of Stockholm, to whom I have taken the liberty of dedicating this, the second part of my book, as a small token of my appreciation of the interest and kindness he has shown towards my South American researches. I also mentioned in the earlier preface that Consul-General Johnson has in every way tried o further Swedish researches in S. America, above all by granting free passages to all the Swedish explorers visiting that continent on board his comfortable and stately ships.

C
CC
126
127
Ce
D2

This work is based on collections made by me in S. America, as well as on the study of material in museums and of books (See Part I). I would remind my readers that these researches have been carried out with the upport of Swedish patrons of research-work, notably Arvid Hernmarck, Esq., and Mrs. Ina Smitt.

010

I have to thank several of my friends and colleagues for valuable communications, which I have made use of in one way or another in the present work. These are: Mr. Kaj Birket-Smith of the National Museum, Copenhagen (M. C.), Dr. G. Friederici, Dr. R. Karsten, Prof. Dr. Th. Koch-Grünberg, Director of the Ethnological Museum, Stuttgart, Dr. F. Krause, Ethnological Museum, Leipzig, Dr. J. P. B. de Josselin de Jong, Royal Ethnographical Museum, Leiden, Licentiate Sven Lindh, Prof. Dr. Max Schmidt, Ethnological Museum, Berlin, (M. J. V. B.) and Dr. Max Uhle. Every possible courtesy has been shown me by the Riksmuseum,

Stockholm, through Prof. C. V. Hartman, Dr. G. Lindblom, and last but not least by its skilled attendant A. Törnblom. The objects described here which belong to the Riksmuseum in Stockholm, are marked R. M. with the number of their inventory, those belonging to the Museum at Gothenburg are marked G. M.

In the last named museum there are, inter alia, collections made by Lieutenant O. Liljeualch and Mr. Otto Thulin. The latter has supplied me with a number of valuable oral particulars which are reproduced in the following.

I am also greatly indebted to Dr. Lars Wählin, Head Librarian of the Stadsbibliotek at Gothenburg, for procuring rare books for me to consult and for translations of Latin quotations. As the works of Italian authors occasionally caused me some trouble, since I cannot read Italian fluently, Consul-General E. Correa was good enough to help me when in difficulties.

The illustrations to this volume are chiefly due to Mr. A. Hjelm and Miss A. Danielsson. Some of the stereotype-plates were kindly lent me by Mr. K. O. Bonnier, the publisher of my popular works. Most of the illustrations, however, were made by the Opla Company of this town from pictures not previously published.

The translation into English of my Swedish manuscript was carried out by two translators and revised by Dr. G. E. Fahrken.

corroborated by the accounts of PEDRO PIZARRO and XEREZ, who were eyewitnesses of the conquest of the Inca empire. In the high mountain country it is natural that hammocks should not be used as beds. In such parts they would be too cold. It is harder to make out why hammocks were not used in the coastal regions of Peru.

Evidently the hammock in S. America is so old a culture-element that it is impossible to decide whence it came to the Chané and Chiriguano. The latter certainly, and most likely the former too, used hammocks when they settled in their present territory. The technique employed in most Chané and all Chiriguano hammocks is the same as, with small variations, is mostly used wherever hammocks occur.

It is possible that some tribes about the river Amazon preferred palm-fibre hammocks to cotton ones, because the former are cooler. Possibly, too, in these regions of moist heat, hammocks of palm-fibre are less liable to rot and to be attacked by insects than those of cotton.

I here append a map (3) showing the distribution of hammocks of different material after PATER SCHMIDT, with certain additions, as will be seen from table 3.

The seat so characteristic of the Indians in great parts of S. America is a rather uncommon piece of furniture in the huts of the Chiriguano and Chané (Fig. 3). Its distribution in S. America has been investigated by PATER SCHMIDT[8] and SAVILLE[9]) wherefore I beg to refer to their works. In my own sphere of work I saw seats among the Quichua mestizoes at Callegua, among the Mojo, Huari, Baure and Huanyam. The seat as a culture-element has its southern boundary here. It occurred, though rarely, among the Incas, where seats seem to have been the special privilege of the chiefs[9]). Most likely it is a culture-element which the Chané

142

To me, the Chiriguano seemed to be of better physique than both the Puna and the Chaco Indians, and their cast of features, as a rule, to be less rough-hewn than those of the above-mentioned tribes. Herma ten Kate has taken anthropological measurements of four Chiriguano men, [141 [127] whose average height was determined at 1[illegible] cm.[1] Lehmann-Nitsche, who has made anthropological observations of 50 Chiriguano (40 men and 10 women), is my authority for the data I have grouped together in the subjoined table.[2]

The Chiriguano: some physical data.

Sex	Average height, cm	Shape of skull	Colour of skin, Martin's scale	Colour of hair, Fischer's scale	Iris, by Martin's scale
Men	[illegible]	Dolichocephalic — mesocephalic	Majority 33	Majority 4	Majority 3—4
Women	[illegible]	Dolichocephalic — mesocephalic	Majority 38	Majority 4	Majority 3—4

142 The Chiriguano complexion is, accordingly, brown with a tint of yellow; the iris is dark brown, the hair black, coarse and lank. The growth of hair on face and body is very scanty.

361 The Chiriguano are not a nomadic people, but live in permanent villages, some of which are the abode of only a few families, whilst others contain [119] several hundreds of inhabitants. At Itiibi I was studying a Chiriguano village that, according to the Indians, was inhabited by about 500 people. This village was situated on a plain surrounded by wooded mountains (fig. 188). The huts formed a large circle, with the chief's hut in the centre. In the open space between the chief's hut and the rest, there were growing some close-foliaged trees (probably of the Bignoniaceae family), affording much-needed shade. In earlier literature it is stated that [579 [609] the Chiriguano used to build a hut for strangers in the middle of the village plaza.[3] In many of the Chiriguano villages I visited, the huts were scattered about without any perceivable order.

342 The huts are rectangular and with ridged roofs. (Figs. 189—190.) The walls either consist of perpendicular sticks, of tree-branches or reeds,

/<u>Ib conc.</u>/

Figure 33b, which corresponds, as does also the form of this flute, completely to ancient Peruvian models. Also, the surface of the Chiriguano case from L.A. 496 (cf. Fig. 34a /see p. 89/) shows some inclings.

One of the carved decorations is shown in a drawing by Nordenskiöld, who found it on a woman's arm (310).

310. Nord. 1, Fig. 116.

Social Conditions among the Chiriguano and Chané

With regard to the social conditions among the Chiriguano and the Chané-Izoré, I am unable to add to the few data which we know on this subject because the situations in which I found myself when with these Indians were not appropriate for such investigations.

/65/ Among the Izoré whom I found in Toledo there were some who were designated as cacique. To one of them, who spoke Spanish perfectly, I owe the vocabulary of the Izoré language which I wrote down. I met the Chiriguano only in Macharetí, where they had lived for a long time under the supervision of the missionaries and, at the time of my trip, under the chieftainship of one of their own fellows who exercised the functions of a commissioner /<u>comisario</u>/. Two other Chiriguano Indians whom I met in Macharetí were identified as caciques.

In order to complete my statements about the Chiriguano and the Chané-Izoré, I must make a resumé of what we know from the literature regarding the social conditions of these Indians, referring to Métraux's statements, which are based on old documents, as well as those of v. Nordenskiöld, which are based upon his own investigations.

Naturally, many of the old Chiriguano and Chané social institutions have been lost since they lost their independence from the whites. Also, the power of the great caciques has diminished appreciably since they have been dependent on the whites. When Nordenskiöld

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

The migrations, wars, and the religious conversion of the *Chiriguano* have been the subjects of many historical monographs. The most important of these are by Corrado (1884), Serrano y Sanz (1898), Dominguez (1918), Gandia (1929 a, and b), Métraux (1930 b), Coni (1925), Moreno (1929), and Finot (1939). The Jesuit missionary work among the *Chiriguano* has been described by Lozano (1941) and Muriel (1918).

CULTURE

SUBSISTENCE ACTIVITIES

As today *Chiriguano* and *Chané* share in the same culture, the following data may apply to both tribes.

Farming.—The *Chané*, conquered by the *Chiriguano*, were proficient farmers who, though practicing a tropical type of agriculture, were probably acquainted with many of the methods of cultivation of the Andean area. The *Chiriguano* adopted their traditions. The new habitat of the *Chiriguano* did not offer the same resources for hunting and fishing as had their homeland. Therefore, these Indians depend on farming to a larger extent than any other *Tupí-Guaraní tribe*. The basis of their livelihood is maize, of which they have 11 varieties, all related to those of Paraguay. Then follow in order of importance: Pumpkins, beans (11 varieties), sweet potatoes, sweet manioc, peanuts, and some Barbary figs (*Opuntia* sp). Sweet potatoes were grown on a large scale by the *Chané* of the Parapeti River.

These Indians also raise cotton, tobacco, urucú, and, in the Parapeti region, reeds for arrow shafts (*Arundo donax*). Plants of the Old World adopted by the *Chiriguano* include melons, watermelons, oranges, sugarcane, and sorghum.

Chiriguano men clear the fields and surround them with a tall fence as a protection against the inroads of wild or domesticated animals, a task which is considered to be particularly strenuous. They also till the soil, but at harvest time they are assisted by the women and children. The latter, armed with slings, drive away the parakeets and other birds which prey on the crops. Nordenskiöld (1912, p. 183) observed that among the *Chané* of the Itiyuro region, large maize fields were tended by men while pumpkins and beans were raised by the women.

Collecting wild food.—When their crops fail, the *Chiriguano* subsist on the same species of pods and fruits as those collected by the Chaco Indians: Algarrobo, tusca, mistol, caraguatá, and other plant foods.

Hunting.—Hunting is a very secondary economic activity, at least in modern times. Peccaries, which are the main game animal, are hunted with specially trained dogs and killed with bows and arrows or with clubs. Rheas, which are abundant in the Chaco plains, are caught with bolas. Pigeons are captured with clap nets. Special arrows with two points are used for hunting yacu birds (*Penelope* sp.).

114 the Franciscans Conrado, Cardús, Martarelli, Giannecchini, and Señor del Campano, etc. But in Bolivia no complete work is known, notes or pages by authors definitely worthy of every respect and very competent hardly exist, nor have explorers witnessed all that they have written about, from which have come errors which would certainly have been avoided if the reports had not been made so hastily.

121 [124] With all possible calm, patience, and unlimited time, I have set out to talk with the oldest and most knowledgeable Indians, who have explained some points to me, corrected certain others, and made me add still more; but I have already said that with my writing I do not pretend even to equal the luster of those who have preceded me. I shall only give more extension to the ideas which have been set forth by others, ideas which in the majority have been confirmed by the Indians to whom I have addressed myself.

Finally, I must state that since the Chiriguano are in contact with the mission Indians, and these, both old and new, exist in considerable number, I shall add by way of conclusion, after having finished what I have proposed to do, a chapter concerning the heathen Chiriguanos, the neophytes, or new Christians, and the method that the Missionaries use to reduce them religiously and civilly, and the effort required to maintain them in the Catholic faith.

121 • 128 Everyone will understand that, in order to avoid confusion, this small work will be divided into chapters, and the chapters into sections, for greater clarity and so as not to tire the reader. Certain terms that I must print here by necessity will be written in the Chiriguano language with their corresponding explanation, so that each one may understand the impact of the language. I could also formulate some general propositions with the corresponding Spanish, but the nature of this somewhat voluminous book does not permit it, nor is it necessary, because /xv/ there are various small handbooks which have been printed in this Republic of Bolivia.

/105 cont./

797 361 setbacks, and endured the bitterness of having some captured by the savages, but the establishment of the town is now an accomplished fact. It has a pretty church, consecrated at the end of July, 1908, and the only thing lacking is a priest in residence to attend to them spiritually with great care, because Machareti is quite far for this widespread parish (1).

1. The Christians who explored the territory of Carandaiti received the land promised; there is no potable water other than that of the ponds, which are in danger of being emptied. The preservation of this town should receive the attention of the Government of Bolivia for the sake of commerce, the cattle industry, transportation, and the prospect of new explorations to the east.

•128 127 /106/ With the brief summary which I have made with reference to the missionaries among the Chiriguano and to the towns of whites built in the same region, presided over by the Franciscans of Tarija and Potosí, I bring an end to this second chapter, in which several opinions regarding the origin and point of departure of the Chiriguano for the region which they occupied, and with slight differences occupy at present, have been expressed.

There is no invention in it; by means of patient verification from different persons at different times, by consulting numerous authors, who, by study, reference, or in passing, have left something in writing, I have come to learn certain facts which, if they are believed here, are also believed in other places, and I have concluded that not all of it could be a fable, and as I have heard them told, so do I present them to my readers. This is the chapter which has concerned me most, and I do not know if the time, vigils, and the sleep of which my eyes have been deprived have been well employed; be that as it may, the public now has it.

/190/

291 The crown of the hat is made of four oval parts, as is
294 the brim which surrounds it, sewed with fine cords of the same material, and the edge of the brim is turned upward. The hat has a band of the same material sewed to both sides at the temples to hold it to the throat; a knot or a ring on the band can be used to tighten it.

292 The Ambícuai, which lends its name to the whole outfit,
281 is a perfect cassock, but its form is entirely Chiriguano, for it does not hinder the movement of the arms. Its cut is not straight, and both parts are made fast at the chest with two leather straps, which are run through the holes on the opposite side. The cassock in back ends in two points, where there is a kind of ornamentation of the same leather, which consists of short, fine strips, like a tassel. The sleeves are wide, as is the whole garment, and are attached to the shoulder, being open at the armpit so as not to impede the movement of the arms, either in hunting or in war, where the grandees also
[126] wear it. In fact, in the photograph taken in Santa Rosa to be sent to the exposition, a hunter and a warrior dressed in this
529 doublet appear outside the circle. In the middle there is a
554 Chiriguano woman with her crown and adornments as queen
562 of the fiesta, who offers chicha to all who are enjoying themselves (1).

1. The queen is the one who serves the dancers as mistress and patroness of the fiesta. This
• [128] photograph or figure will not be reproduced in the chapter dealing with fiestas because I could not obtain it.

292 The Timbiao, breeches, is also of leather and is made
[281] of four pieces, wider from the waist to the sacrum and narrower from the thigh to the bottom. It is quite wide and comes to the ankle. It is rougher than the rest, but more valued, and they will give anything to have even a single pair. This garment is tied at the waist with a belt or with two strings which are sewed across the entire width of the garment itself.

127 128 Some of the lithographs for Etnografía Chiriguana have been reproduced from the Anthropologie Bolivienne of Doctor Arthur Chervin, as well as others from the work of Señor del Campano, and the rest from photographs which I was able to get from some amateur photographers among the Franciscans.

Some of those of the first-named author and all of those of the second were reproduced from the album which is kept in the Potosí missions and in the Franciscan Colegio de Tarija.

If the author of the Etnografía had had the necessary time available and had been able to rely upon a collaborator, it would have been easy, most easy, to have reproduced with photographic apparatus important scenes, beautiful landscapes, enchanting panoramas, high and thick palm groves, immense beaches on great rivers, and other innumerable beauties which exist in the region. In a second edition all this could be done, if the Supreme Government would make available the necessary funds so that a scientific tour might be made through the entire region in the company of a photographer.

128

The reader will find that I have endeavoured to make this part more graphic than Part I . From the maps of bibliography it will be seen regarding what regions I have had access to literature; it can also, in some measure, be seen whether the blanks on the maps are due to those particular tribes never having been closely studied.

The maps of distributions in this work are fewer in number than in Part I. This is because we find the Chiriguano and Chané, or one of these tribes, on twenty-nine maps in Part I. Part I is largely preparatory to Part II. Parts I and 2 together contain 45 maps showing the distribution of culture-elements occuring among the Chané and (or) Chiriguano.

C
CE
121

All who are interested in the ethnography of S. America will, I venture to think, find the maps worth close study and will see that from them various deductions can be made not only respecting the Chiriguano and Chané Indians but also as to the ethnography of S. America in general. In some measure I have, indeed, endeavoured to do this myself.

C
CE
131

The land of the Chiriguano and Chané the Indians streches from near Sta Cruz de la Sierra to near Rio Bermejo. Southwards of Sta Cruz the territory inhabited by the Chiriguano is continuous. The Chané, on the other hand, live in several different quarters, some at the river Itiyuro in the Argentine, some at Caipipendi near the Rio Pilcomayo, some at the Lower Rio Parapiti, and others near Itau south of the Rio Pilcomayo. The neighbours of the Chiriguano and Chané are the Mataco-Vejos, Mestizos, and Whites to the south, the Mataco, Toba, Tapiete, (Yanaygua) and Tsirakua to the east, to the north Mestizos and Whites, and to the west Quichua, Mestizos, and Whites.

Toilet-Articles, Tattooing etc.

Ee 55 171 174

The Chiriguano and the Chané are careful of their personal appearance. They are cleanly people, much cleaner than their neighbours. If these tribes had emigrated from the cold Bolivian mountains into their present territory, part of which is very poorly watered, they certainly would not bathe once, or even several times a day, as they do, but would be as dirty as the Quichua and the Aymara, who are, incredibly filthy. Their Chaco neighbours, too, the Mataco are also extremely dirty. In the parts I have explored it is only in Mojos that we find Indians as cleanly as the Chiriguano and Chané, these being the Mojo and the Baure, kindred tribes of the Chané. On the other hand the Guarani Indians in North Bolivia, the Guarayú, are less clean, even if they are among the «clean ones». The Guarani in Paraguay are, however, said to be very cleanly. The cleanliness of the Chiriguano and the Chané is a positive proof that they migrated to the territory now inhabited by them from warmer and well-watered parts, where bathing was pleasant and easily accessible. The Chiriguano and the Chané have not learnt to bathe from the Mestizos or the Whites, whose habits are anything but clean in these parts. Cleanliness is certainly not a virtue suddenly acquired by any people, but may indeed be regarded as a race-peculiarity. A map of S. American cleanliness would most certainly enlighten us on several points of interest with regard to the origin of the tribes. Now, when I read that the Mundrucú are very dirty I am sceptical of their being Guarani-Indians, and consider it much more likely that they are naturalized Guarani of a different origin. I shall not venture to give a map of S. American cleanliness

Aymara SF5

here. In order to do so, it would be necessary for me to have seen much more of S. American Indians than is the case. I will, however, here try to give the tribes I know a *certificate of cleanliness*. I mark the dirtiest, the Aymara, with o and Mojo, the cleanest, with 5. At the same time I will give them a certificate of orderliness, i. e. point out to what extent they keep their huts tidy and their belongings clean and neat. These 'certificates' are also of considerable interest as a means of understanding the cultural development and relations of the tribes.

I consider that a distinction should be made between the Chané who live on the Rio Itiyuro and those living on the Rio Parapiti. The former are poorer and characteristically enough less cleanly than the latter. It is of a certain interest to see that skill in arts does not always go hand in hand with tidiness and cleanliness.

The more or less high standard of Indian art, at least among present-day tribes in E. Bolivia, is dependent on whether they have been influenced to a greater or less degree by pre-Columbian civilization in western S. America.

Resumé.

C
Ce
12
177

In the foregoing pages I have attempted to analyse the material culture of the Chiriguano and Chané, and have tried to show from where they have derived the cultural elements existent among them. Finally I will see to what extent conclusions can be drawn from what has been said above, as to the changes the material culture of these Indian tribes has undergone under the influence of an entirely strange culture — that of the Whites — and of a kindred culture — that of the bronze age in the west. Furthermore, we will see what the Chiriguano and Chané have kept of the culture they had before they migrated to the districts they now inhabit, in what measure they have adapted themselves to their new natural surroundings, and what they presumably have learnt from their neighbours the Chorotí, Toba, Matacó and Tapiete.

C
Ce
●128
177

I have shown in tabular form the cultural elements the Chiriguano and Chané received from the Whites, those they received from the Mountain culture, and those that derive from the north and the east. This third table embraces such cultural elements as the Chiriguano and Chané took with them when they migrated to their present habitat. In the tables I have mentioned, as the reader will see, in the case of each cultural element whether its distribution in the region examined is favoured by natural surroundings, whether in its distribution it is in general independent of such surroundings, whether it is of great importance in the struggle for existence, whether its manufacture calls for technical skill, whether it is man's or woman's work, whether it is used by men or women or both, or only by children, whether it may be looked upon as still frequently used or as disappearing, and whether it can be regarded as a

luxury or as a necessity. The tables thus reveal, for instance, whether these Indians have received chiefly articles of luxury from a certain source, whether what they received was mainly what women manufacture, and so forth.

Among the Chiriguano and Chané we naturally find a number of cultural elements with regard to whose origin we are quite ignorant. Without doubt many of these have a large distribution, but it is simply unknown. Others again have a distribution of such a nature that it yields us no conclusions regarding their origin. The Chiriguano and Chané have no cultural elements of any importance that are not known from one or several other Indian tribes. There are, of course, minor peculiarities in shape and ornamentation that characterize all the belongings of these Indians when compared with similar articles from other tribes, but I know of no striking invention of any description to the sole credit of these tribes.

A. *The influence of the Whites on the culture of Chiriguano and Chané*

The cultural elements the Chiriguano and Chané certainly or presumably derived from the Whites, are given in the table 20. It includes such elements as they manufacture themselves, but are indebted to the Whites for the idea; cultivated plants and domestic animals which were not introduced among them until post-Columbian times.

If we examine the table 20 we shall find that it embraces 31 cultural elements. It omits a few cultivated plants obtained by the Chiriguano and Chané from the Whites which are not, and never were, of any importance whatever. Likewise a few domestic animals that are rarely seen. It includes three cultivated plants and four kinds of domestic animals. Of the remaining cultural elements, 17 are man's or boy's work, and only four woman's work. The majority

[text continues on p. 200]

is conservative, which may partly be connected with the fact that for him, as KARSTEN has pointed out, colours and ornaments have a great magical importance. When the Chiriguano and Chané obtain by barter glass-beads for their labrets, these must be blue, like the turquoises they were wont to fasten in them.

When they come across anything in the culture of the Whites that approximates to their own conception of the ideal, the Indians have no difficulty in adapting it to their own use. We know that the dance mask is an Indian practice: it is therefore quite natural for the Indians to have embraced the carnival of the Whites with great interest and have added to it their own dances, in which they appear with masks on.

B. *The influence of the bronze age culture on that of the Chiriguano and Chané.*

In the table 21 I have put together the cultural elements that the Chiriguano and Chané have very probably obtained from the culture zone in the west. We can see at a glance that this influence has been very considerable. The positive influence has been greater even than from the Whites.

If we look into the table we shall find that the Chiriguano and Chané have especially learnt from the culture zone in the west such things as are connected in some way with festivals. Here belong the men's festal attire, several adornments worn by men and women, the feather parasol, the finer sorts of pottery, the ornamentation of calabashes with pyrograving, several musical instruments, games, etc. When we know with what interest the Indians have embraced the festivals of the Catholic Church, wherever they have had an opportunity of doing so, it can easily be understood that the tribes that were neighbours of the Incas, also imitated their festivals.

Notes on the Bibliographical maps.

S
C
Ce
113
114
128
102

To this bibliography several maps have been added which ought to prove useful from many points of view. *The maps indicate the territories concerning which the authors quoted in parts 1 and 2 made their investigations.*

The first map shows the literature from 1498—1600, the second from 1600—1700, the third from 1700—1800, the fourth from 1800—1900 and the fifth from 1900—1920. We find a separate map of the archæological literature. Several important works are unfortunately missing which I have not been able to study. It is difficult and expensive work to collect the literature on the S. American Indians. Not the least difficult of access are certain works printed in S. America during the 19th century. For my ethno-geographical studies I have of course read a number of books without finding anything to quote from them and consequently they are not mentioned here. I desired especially to show the merits and demerits of the maps of the distribution of the cultural elements here published. The maps of the authors' names show us the districts from which I have no material at all and those from which I only have the material of older authors, or only of modern writers.

Some authors have not travelled in the territories they have written about, but have drawn from the works of several other authors. The most remarkable existant work of this kind is COOPER's excellent work on all that has been written about the Indian tribes in southernmost S. America. If there were many such compilations, it would not be difficult to draw up maps of the distribution of the various cultural elements.

From the map that indicates about which districts the archeological treatises are written, we can see, even though

some names are missing, what immense territories in S. America are still entirely unexplored archeologically.

The bibliography includes some authors whose names will not be found in the maps, i. e. FRIEDERICI and PATER SCHMIDT, great as their services to the ethnography of S. America have been. This is because they have written comprehensive works dealing with the ethnography of the whole continent, and not with any particular part of it.

When I have quoted from several works by the same author, these are numbered 1, 2, 3, etc. in the bibliography. The same work has the same number in the First and Second Parts of my own book.

/156 cont./ Ce 115
from the often vulgar, empty whites. Batirayu, however, is also an exceptional man, the makings of a great man, who is condemned to idleness.

Batirayu is a Chané. These Indians now speak the same language as the Chiriguano, namely, Guarani. Most of their customs and usages correspond to those of the Chiriguano, by whom they were probably subjugated. According to their origin, however, they are Arowaken /Arawak/ and hence the most southerly dwellers of this group, which had, and still has, a wide distribution in South America and on the Antilles. Ce 197 171 648 Ce 101

/157/ If I describe the Chané and the Chiriguano together here, it is because their material culture is so similar. Nevertheless, I have indicated in which tribe I made this or that observation; this is especially true for the religious domain, in which the Chané, at least on the Rio Parapiti, have kept many old conceptions which are unknown to the Chiriguano. Ce 128 171 778

Batirayu told me that a few of the Chané still knew some words of the old language of the tribe. He said that especially at the drinking bouts, when they are intoxicated, they give themselves airs by speaking the old Chané language, which otherwise has the character of a secret language. Ce 197 554 273 Ce

In the company of Batirayu I set out for the village of "Huirapembe" where the Indians who knew Chané best were supposed to be found. It was not easy to draw their secrets out of them. Actually, only the youngest ones, who knew the least, were willing to tell me something (1). One old woman who was Ce 128 197 119 17 Ce

The Chaná and Chiriguano never relieve themselves close to the hut. I never saw special privies, however, for any Indians, and not for many whites in Bolivia either.

The Chaná and Chiriguano are very careful with their clothing. They keep it clean and mend it if necessary. The members of each sex wash and mend their own things. The men here sewed quite as well as the women.

I have spoken here of the everyday life of these Indians. Now I shall describe the most important events in their lives, in their social life, their festivals, their industry, etc., and

Izozo

/2 cont./

or Tapyi /Tapii/, it was not possible from what they said to ascertain with which of the tribes known to ethnology they can be identified. The Chiriguano call themselves "Mbya." If the Izozó were a part of them, they would have called themselves by this name. We doubt they are Chané and that part of the latter which once had their homes in the Izozó River region, taking the name of this river for their own. Their culture, as demonstrated by the objects I collected among them, confirms this opinion. There are some differences between the objects collected among the Izozó and the Chiriguano in Macharetí, either with regard to the decorations of the baked clay vessels or with regard to the making of the nets. But in principle it is not possible to decide whether these differences might not be only local differences. In general the culture of the Chiriguano was diffused in this way throughout the tribes successively subjugated by them, which is why it is proper to deal below with the aspects of the culture of the Chiriguano of Macharetí together with that of the Izozó.

Influences on the Culture of the Chiriguano and Izozó, Taken from Historical Data

At the present time the Chiriguano and Chané form a cultural entity which can be designated as the culture of the Chiriguano, because the Guaraní language of the Chiriguano came to be the common language of the whole group. The Izozó also belong to this ethnic entity. Thus it is necessary to consider this entity /6/ as being formed of completely different tribes. It is also necessary to conceive of their culture as the product of the fusion of very heterogeneous cultural elements. Nordenskiöld deals with this question in one of his books (1)

1. Erland Nordenskiöld: The changes in the material culture of two Indian tribes under the influence of new surroundings. Comparative Ethnological Studies. I. Göteborg, 1920.

/11 cont./

little from the Indians of the Chaco, we must derive the most important modifications in their culture from the influences of the ancient Peruvian culture. Because of the short duration of the Inca Empire after the time of the immigration of the Chiriguano, we must suppose that these influences were less direct influences than indirect ones through the confluent peoples of the mountainous land of Peru and Bolivia, who had been in contact with the ancient Peruvians for a long time and many of whom had been subjugated by the Chiriguano and made to enter into their community as slaves or vassals. We know that the culture of the Chané, who made up the greater part of the Chiriguano population, had contact with the ancient culture of the Peruvians. In contrast with the influence of the ancient Peruvian culture, the influence of the whites had rather more negative and destructive effects than constructive ones on the primordial culture of the Chiriguano and the Chané, leaving many native industries superfluous because it was more convenient to replace their products with imported merchandise.

In the respective chapters that deal with the various developments of the culture of the Chiriguano and Chané, we shall expound the details of these cultural influences.

433 241 sweet potatoes; corn grows everywhere. tomatoes and garlic mature the year round. and in the garden lettuce. cabbage. cauliflower. and peppers create the beauty of a spot. without taking into account the gastronomic advantages. Even the peach trees would yield fine fruits. but they suffer much from the black butterflies. which damage them before they ripen.

Without work the land will produce only briars and brambles. and /16/ as long as there are only Chiriguano and cattle ranches here. progress will be slight and the population sparse. because the Indian has no ambition. and life is relatively inexpensive; the whites prosper by taking good care of their livestock. and no greater fertility can be obtained from the land because the holdings of a few families are very extensive and do not facilitate the residence of numerous renters. who do not always give good results nor do all come or ask to rent for farming alone. All of them want to get rich easily and quickly. and the best way is to raise stock. the result of which is that great areas of briars and brambles exist.

[57 71 75]

Flora

• 13 In the course of this hasty description I have noted that in Chiriguano country atmospheric changes are very sudden. but it has been noted that the region is quite fertile when it is watered by the rains or by irrigation ditches. because small rivers are plentiful. particularly in the mountainous region. and an occasional river of some size bathes the adjacent territories with its abundant waters.

There are many hills. pampas. and valleys. and for this reason every kind of climate may be found in this territory. [37] There are in fact oppressive heat. intense cold. and a temperate climate. thus making it possible to find land for every product from the lowly gourd to the savory chirimoya. from the ubiquitous maize to wheat. rice. and barley. from the mulberry /mora/. which grows spontaneously. to the rich grape. whose bunches reach weights of three and four libras.

/153 cont./

In the dry season the wind heaps large dunes along the banks of the river. After it has left the mountain, it does not receive a tributary. The Río Parapití is very wide, but never deep. During the driest period its bed is transformed into a sand desert where the wind plays with the fine river sand. When it storms, the sand is swept across the bottom of the river. If one wishes to cross it on such days, one may perhaps not get his feet wet, but he must shield his eyes. C 133 132

The Río Parapití is rich in fish, but the fish are tiny. The banks are quite fertile, but inasmuch as they are flooded during the rainy season, the harvests are easily lost. Often in the dry season everything is wasted by the scorching droughts. The locusts, too, hawk about in these regions and leave behind in their own unappetizing bodies a poor substitute for what they have destroyed. C 130

On the Río Parapití, high up in the mountain, live the Quichua Indians, then come the Chiriguano, beyond them, near the river, the Tapiete, also called Tanoygua, then the Chané, and finally, in the unknown wilderness, the Tirakua Indians. C 101

My first visit on the Río Parapití was paid to Father Carmelo, who had a small mission station there among the Chiriguano. I became very fond of this monk. /154/ he had such confidence-inspiring friendliness. He is one of the missionaries who are needed here, people who desire and are able to sacrifice themselves for others, who show an equally great friendship toward all. C 114 117

I now continued along the Río Parapití to Itiparenda on the north bank of the river. The Tapiete live opposite Itiparenda. I shall later describe a visit that I made to them. C 114 [91]

At Itiparenda I met the first Chané, or, as they are called here, Tapuy. I then visited most of their villages. I made the acquaintance especially of some of their storytellers, of whom Retiayu, the nephew of the last great chief, Aringsi, became my good friend. Ce 114 [101] [538] [123]

From the lower Río Parapití I proceeded by way of Charagua, a village inhabited almost exclusively by whites, to the Caipipendi valley, where I stayed with the Chiriguano chief Tarairi. C 114

/154 cont./

One might be surprised that a person would want to live in this treeless valley, where one finds only salty, dirty water, but in the Caipipendi valley one need not drink water, for here the maize yields magnificent harvests and there is never a shortage of maize beer. The inhabitants of the Caipipendi valley are wealthy, and if there is famine in other regions, the Indians come from afar to these kinsmen, in order to barter their valuables for maize.

For the collector, too, it is a magnificent valley. We found silver ornaments, silver bowls, finely carved musical instruments, and many other rare articles in this ethnographer's paradise. Stone axes, ruins, diggings /Grabfelder/ of various peoples prove that the Caipipendi valley has long been highly prized by the Indians.

The water has cut deeply into this valley. In the rainy season it probably rains there too.

From Caipipendi I returned over the mountains, through a /155/ valley famous for its hot springs and its beauty, to Charagua, to continue then along the Andes in the direction of Santa Cruz de la Sierra.

It was October, 1908. Not quite a year later, in July, 1909, I again visited the Chaco, after extensive river journeys far beyond, on the border of Brazil. In another book I shall describe these journeys on large, navigable rivers and through virgin forests whose luxuriant green is overpowering.

From Santa Cruz de la Sierra I returned, as was said, to the Chaco in July, 1909. I then traveled first of all by way of the Rio Grande to the Rio Parapiti, chiefly to visit my friend Betirayu.

The Rio Grande is the southernmost tributary of the Amazon River. It comes from the highest mountains of the Andes and flows past Sucre, a city that has long contended with the city of La Paz for the rank of capital of Bolivia. When it emerges from the mountains, it is a roaring, mighty river. Farther down it has an extremely changeable, very little known course. North of Santa Cruz de la Sierra the Rio Grande receives the Rio

/160 cont./ Ee 13

The region settled by the Chiriguano and Chané Indians is really very extensive. It is varied in nature, from luxuriant virgin forests to extremely arid valleys and plains poor in vegetation. It is in part very mountainous, but the Chiriguano and Chané are not mountain people. They stay down in the valleys and do not climb up to the peaks and plateaus, like the Quichua Indians. Ee 136

Animal life in these regions is poor, in fact, very poor. A hunting people could never live there. Now and then a roebuck, a wild pig, a few ostriches, that is all one sees in the way of big game. Bird life, too, is very poor. /161/ Ee [133] The number of lakes is very small, and they are no larger than what we would call pools in Europe. On the Rio Parapiti one sees quite a large number of white egrets (1), famous for

1. Ardea.

Ee [262] their valuable feathers. With regard to wood fowl, only the chicken called "pavas" (2) contributes to the diet. Occasionally

2. Penelope.

one sees a large-billed "toucan" (3). Sleek pigeons, fattened

3. Rhamphastus.

on maize, often live in masses in the fields of the Indians. Ee In the Rio Pilcomayo there is a great abundance of fish; in the little rivers the fish are small and poor. The Indians who [243] live in these regions have to be farmers, and they are maize [262] farmers to the highest degree. For them maize is food, [273] drink, pleasure, everything!

I have no adventures to report from among these Indians. ooo Everyone may travel unharmed among them. The greatest sorrow of the ethnographer is that he is unable to collect all the interesting and old things that he sees there. One cannot take everything home.

/316 cont./

E decided to make an expedition and go back to the region where
175 Alejo García had gone. When they had summoned many Indians
167 of this province, they started going by bands and tribes. The
Indians from below, the ones from the Paraná, followed the
E course of the Araguay River, which is, as I have said, the
131 Pilcomayo. These are the Indians who today live on the
175 borders of the Corregimiento de Tarija: the Indians who lived
167 in the region of Asunción entered on the right of the Paraguay
River in the direction of Caáguazú. The Indians of
Jeruquisaba and Carayazapera who were living higher up on
the river left it near San Fernando. The latter are the ones
who today are established on the Guapay River /317/ 20 leagues
from the city of San Lorenzo, government of Santa Cruz da la
Sierra."

E In the commentaries of Alvar Núñez Cabeza de Vaca
E (Hernández, pp. 299-301), it is a question of another migra-
175 tion which does not appear to have any relation to that of
167 García, which was several years later. I shall quote this passage
648 in its entirety, for it illustrates well certain vicissitudes of this
great ethnic movement: Alvar Nuñez Cabeza de Vaca had sent
a Spanish detachment to the Xarayes Indians to try to confer,
with them as intermediaries, with a group of Guarani Indians
who had settled a short time before in their neighborhood.
The emissaries failed in their attempt, for Xaray and Guarani
were irreconcilable enemies. By way of consolation, the
Xaray cacique had put them in touch with a Guarani Indian,
married to a Xaray woman, who had lived among them for a
long time. "This Indian, who belonged to the Guarani race,
had been in the villages of the interior of the lands and /318/
knew the roads which led there." The Guarani was invited to
accompany the Spanish detachment and, interrogated before
the Governor by interpreters, he declared "that he was a Guarani,
originally from Itatí /Fig. 1 appears here/ on the Paraguay River;
that in his youth his people summoned and made a great levy
E of Indians of all the land and went toward the land and the
[721] villages of the interior. He himself had gone there with his
[726] father and his relatives to make war on the natives of this region.

[Text Continues on P. 41]

C /331 cont./

175
[167]
[173]

This migration had as its motive power the attraction which the metal riches of the Inca Empire exerted on the Guarani, and perhaps also certain mystical factors (the myth of the "Land without affliction").

/332/ The famous expedition of García is probably only an episode in this great migration.

ce
[197]
[199]

At the foot of the Andes the Guarani found a population of Arawak speech, the Chané, whose civilization had felt strongly the influence of the tribes of southern Bolivia subject to the Inca.

C
[618]
[619]
[619]

The Guarani exterminated part of the Chané, reduced the others to slavery, and took Chané women as wives.

The Chiriguano nation issued from this ethnic mixture.

C
[199]

From a cultural point of view, the Chané exerted a decisive influence on the Chiriguanos; and it is through them that today certain aspects of the Inca civilization are continued by the Chiriguano.

ce
[199]
[199]
[198]

On their part the Chané adopted the language of their conquerors, keeping for a long time their Arawak speech as a secret language.

C
175
131

Situation of the Chiriguano in the 18th Century and Today

In the 18th century the territory of the Chiriguano can be defined as follows: "According to Jolis and Hervas, their domain extended from Tarija to the east a distance of 50 leagues (250 kilometers), and from north to south, 100 leagues (500 kilometers). Their frontiers were the following: In the north they reached 17° south latitude and advanced as far as the Jesuit missions of Chiquitos. In the south they reached 22° south latitude. In the region of Salinas, Itáu, and the upper Pilcomayo, they had as neighbors the Matako-Matagusayo and the Toba. Toward the west they had establishments as far as Chichas, Pilaya, Laguna, and Valle Grande. Permanent

C
[101]
C
[361]

/332 cont./ Permanent?

villages were there under the command of hereditary caciques. The middle course of the Parapití formed their boundary to the east. In the 18th century the Chiriguano constituted the most important and remarkable nation of the western Chaco. The statistics concerning them vary a great dealt the figures, given with their usual exaggerations, vary between 41,000 and 15,000 warriors. The Chané are included in this number, which completely removes all value from these statistics." (Kersten, pp. 68-69.)

Today the boundaries of the Chiriguano have stayed about the same. But even though they inhabit a territory whose extent has varied little, their situation has none the less undergone great changes. Several thousand half-breeds from Tarija, Santa Cruz, and Chuquisaca have settled inside this area that we have defined. A Chiriguano frontier no longer exists, but only remains of villages and small groups which still mark the former extent of the tribe. On the other hand, the number of Chiriguano has diminished terribly and is diminishing each day, so that a few years from now the true habitat /333/ of the Chiriguano will be contained between the Parapití and the Pilcomayo and will be reduced to the former Franciscan missions and to several valleys of the Precordillera, such as those of Caipipendí and Igüembé (1).

1. Some historians not well informed about the ethnic geography of South America have claimed that in the 16th century the Chiriguano lived well beyond the boundaries I have indicated. One of them (Dr. Pulgencio Moreno) went so far in this direction that he attributes to the Chiriguano the possession of a large part of northwestern Argentina and pushes this fancy to the point of locating them almost as far as in the province of Córdoba. Mr. Coni in an excellent monograph, documents in hand, has done good justice to these bold allegations and has demonstrated that these hypotheses were without foundation.

/333 cont./

E
172
131
[114]

The archeological arguments of those who believe in a vast extension of the Guarani into Argentina rest on the occurrence of burials of adults in urns in the provinces of Salta and Jujuy. Recently I conducted excavations in several pre-Hispanic cemeteries of this region (Candelaria department. Salta prov.), and I was able to satisfy myself that the peoples who left us these great necropolises had nothing in common with the Chiriguano from a cultural and anthropological point of view. The funerary urns I brought to light are entirely different from those of the ancient Guarani. and the funerary furnishings include no piece which could be attributed either closely or distantly to the Guarani.

T-G
[764]

Burials of adults in urns is not in any way characteristic of the culture of the Tupi-Guarani Indians. and, I might say, even the opposite. Already in 1905 Outes (1) in a very well-documented monograph had proved that the cemeteries of Rosario de Lerma and San Pedro de Jujuy. which Boman (1) considered as Guarani. in no way constituted proofs of a Guarani migration into northwestern Argentina. Nordenskiöld (10, pp. 184-189) and myself (Métraux, 2, pp. 271-276) have resumed study of this question, and our results entirely confirm those of Outes (1). Therefore, as much from the historic as from the ethnographic point of view, boundaries other than the ones I have indicated could not be assigned to the ancient Chiriguano.

/3 cont./

133 The lakes are natural, but not permanent: they are
[135] many and large: in some the water is very good, but from others not even the cattle /4/ drink, because it contains so
[132] much saltpeter. They all receive water from the sky, which sometimes falls with great force and fills them at a single time. White Christians are now making artificial lakes, especially in the Gran Chaco and in the vicinity of Caipipendi.
271 When water is completely lacking, the Indian scratches the
824 ground, looking for the root of the "uyuy," samaño, which is as large as a watermelon: he cuts it at the top, squeezes the pulp with his hand, it turns to water, and he drinks: thus the need is met, but when this drink is taken for a long period, it gives rise to sickness.

311 The land lends itself to farming and to cattle raising,
312 but both industries diminish in those years when the beneficial
433 action of the rains is scarce. Then the crops are lost, and the
132 cattle die from lack of food and from the great amounts of water that they drink from the rivers and lakes on whose banks they stay through lack of energy: nonetheless this rarely happens throughout the region, which, because of embracing a wide area, in one place or another receives showers which renew nature.

Extent and Area

13 The Chiriguano tribe or race was extremely numerous and
[161] thus once took in an extraordinarily large area: traces of these
[464] Indians are found in the vicinity of Tarija,* and they may be found beyond Santa Cruz, where even today Chiriguano men and women are in larger part those in domestic service with the genteel families. Toward the capital of the Republic the Indians still remember that their grandparents used to live in Tacopaya and even beyond, in Talisco, included in the same district. Then they extended toward the Bermejo River and, finally, eastward to within a few leagues of Carandaiti, where the arid zone, inhabited by the Toba and other savages, begins.

/4 cont./

131 Thus formerly the Chiriguano territory in the north was contiguous with the province of Sara, in the south and southwest with Argentina and the city of Tarija, in the west with Tacubaco country, and in the east with the colony of Caranduiti. According to its former boundaries, it then included an area of 200 leagues from north to south and southwest, and more than 90 leagues west to east.

131 16 [698] Today this extensive territory has been much reduced because of emigration, caused in part by the whites, under whose dominion most of them will not resign themselves to staying; the plagues which decimate the race have a powerful influence on its further reduction, and very soon /5/ barely the 131 name will remain. Today to the north it scarcely reaches Abapó, to the south, Rivera de Tacuiba, to the west, Monteagudo, and to the east, Caranduiti, some hundred leagues from north to south and about 40 from west to east.

131 CUB [833] Formerly it embraced several degrees of latitude and three and a half of longitude; as they lost a considerable part of this area, so will they end up by losing it all, for despite their being heirs to the country which God had given them, as one of them was saying to me not long ago, they do not know how to farm it and improve their agriculture; they prefer to go far away and work for others rather than to own land at home. This very day only a few leagues remain in the hands of the Indians, Caipipendi in the province of Cordillera, Gutierrez Canton, and all the territory occupied by the missions, but both are likely to pass into foreign hands, because in fact the Indian is incapable of making the land that he does possess bear fruit; then the few survivors in the territory will be servants in their own house, as are so many others in lands that were once their own.

311 134 [132] The land is very unstable, at least that now occupied; it lacks stone and gravel, and since in their season the rains are torrential, they easily open cracks which in a few years become wide, deep ravines. Contributing a great deal to this are the cattle, which, because of their weight, stir up the land with their hoofs more than other livestock; for this reason

/73 cont./ Before a century had passed after the discovery of this New World, they were numerous in the area near and beyond Santa Cruz de la Sierra. The founders of this departmental city had quite a fight in the year 1575 in order to humble their pride, disperse them, and take charge of the territory; the Chiriguano lived in the areas around Padilla and Tomina, which were founded precisely to contain their advances, since they seemed determined to invade the territory of Chuquisaca itself, whose Audiencia ordered the creation of both settlements so that they might serve as a bulwark and impede successive new advances, new attacks, and devastations.

The city of Tarija with its territory owes its founding to Don Luis de la Fuente, who was ordered there by the Viceroy, Don Francisco de /74/ Toledo, by decree of January 28, 1574. On that date, Don Luis with his army entered the valley of Tarija in order to put down the audacity of the Chiriguano, who were advancing with their arms into the places conquered by the Spaniards. Don Luis and his soldiers were greatly surprised when they found the said valley full of a great quantity of wild cattle, which was to be a powerful aid to his troops (1).

1. It is believed that the wild cattle found belonged to a certain Zárate, who had been forced to leave his ranch by the Chiriguano, who had doubtless made him their victim.

/75/ Before the Spaniards arrived and invaded the country of the Chiriguano, they were the torment of the surrounding tribes, the members of which they shot with arrows, or killed, and took captive, subjecting them to the cruelest slavery. But once the whites arrived, they had to have it out with enemies superior to themselves; fearing that some day they would have to pay for the casualties which they had exacted from those whom they had conquered and whose fertile territory they had taken over, they did not act like the Quechua, who surrendered when they might well have

[i.e., the Chiriguano. -Analyst]

/79 cont./

178 Chaco and O'Connor Province, 5,000, in the Tarija
464 missions there are 4,500, and in those of Potosí, 3,905, which
[197] makes a total of 26,405, including men and women, big
[162] and small, old and young. But of this number there are scarcely 8,000 day laborers, or strong men fit for any work, and what is the extent of land in Chiriguano hands through
[131] their own will or that of others? Some 140 leagues from
[465] north to south, more than 40 from east to west; if today the cultivation of these lands is difficult, tomorrow it will be impossible; if today it is hard to pay 40 centavos to the day laborer, tomorrow they will not be found for 80 centavos.

648 There is a great struggle under way between the
[167] Chiriguano and the white; the latter struggles to increase his fortune and hacienda at any cost and tries to dominate and does dominate the Chiriguano, as one who is nobler and more powerful; the former struggles for his existence as long as he can, but, because he is weak and inferior, yields to the power of the white; when his spirit has been broken by the superior force which dominates him like a slave, he disappears and imperceptibly emigrates to a place where he is treated with more apparent humanity, though not certain and real, but which the Indian does not recognize (1).

[464]

1. According to references, the day laborer in Argentina earns 25 or 30 nacionales per month, without food, which in a foreign land is expensive for the Chiriguano; nevertheless, since the clothing and the animals which the company sells are not expensive, the day laborers who are economical and not given to drink come back well clothed, bringing a horse or an ass or clothing for his children and wife.

178 From this /80/ it follows that the large towns of former
197 times and the very missions which antedate South American
361 independence have in some cases disappeared entirely and others are on the point of disappearing.

/96 cont./

175
648

The expedition entrusted by the Supreme Government to an Englishman, which was to enter the Cayuguari region through Picuigua (water for dowelings), can be said to have failed, because the two attempts which it made were without result and it had to return in order not to perish because of the absolute lack of water.

Picuigua is some 12 leagues distant from Cayuguari. Picuigua is a dry lake, but, with drilling, sufficient water can be obtained for the garrison of the fort which is to be established, should it turn out that the news of the existence of a permanent lake in Cayuguari, where there are some 50 families, is false. /The last paragraph of p. 96, p. 97, and the first three paragraphs of p. 98 are omitted in the translation. The remainder of p. 98 follows./

Itatiqui

361
[131]

The town of Chiriguano infidels with which I head these few lines is located 11 leagues from the Franciscan Mission of San Buenaventura de Ivu and seven leagues from the missions of the Parapiti Grande, at 19° 43' 13" latitude south of the meridian of Paris, and at 60° 70' 42" west longitude.

799
361

The Colegio de Misiones Franciscanos de Pomé is trying to establish in this place a Mision Conversora which would depend on the Fathers established on the basis of the Parapiti River. The idea is eminently civilizing and progressive, because this place is located along the highway which, coming out of Yacuiba, passes /98/ through Charagua and ends in the city of Santa Cruz de la Sierra.

In the journey from the little town of Boyuive to the Parapiti Grande, there is no other town which might be able to provide services for the travelers and the vehicles which traverse it every day without being able now to count upon any assistance in their difficult crossing.

1797

The Indian of Itatiqui is too poor and lazy; it is necessary to get him moving and watch over him so that he may become useful and progress; in his territory there is no water, nor are there artificial lakes so that he and his livestock

/101 cont./

36 (1) 1. Macharetí. -- Father Jerónimo de la Peña was the first to enter Macharetí, but, before he could begin any work, death intervened, and only after a century, that is, in the year 1909, could the Cross of Redemption be raised, around which began to gather the settlers dispersed by the war and the death of Captain Tarucuntí, not very friendly to the missionaries.

(162) Before the mission had been founded for ten years, it numbered more than 3,000 souls, but today it is much smaller, (167) its inhabitants reaching 1,500. Emigration to the Republic (164) of Argentina is a real plague for this area, because the principal recruiters of Indians for work outside of Bolivian territory are there, and it is useless to cite laws, because there are clever interpreters; meanwhile all wait for workers.

36 (133) Macharetí has a delightful and picturesque panorama: to the north and to the east the human eye cannot take in the immensity of the plains or the exuberance of the woods and the variety and caprice of the hills. The town is located on a great plain, but is now quite reduced; its buildings, atop a high hill which dominates everything: it has a beautiful church with painting and /102/ gildings, a mission house of two stories, two great halls, with their respective patios, for instruction, and a third one for the music school, and also other buildings for shops (1).

36 (131) 1. When the Macharetí mission was founded, it cut off the retreat of the bellicose Huacayeños, who were coming into the Gran Chaco by the Charo road, some 15 leagues from Huacaya and some 12 from Ivai; its altitude above sea level is 771 meters and it is located at 20° 49' 58" south latitude and 63° 3' 44" longitude west of the meridian of Greenwich.

/109 cont./

799 5. Tigüipa. -- This mission, dedicated to the universal Patron of the Church, the Patriarch St. Joseph, begin its existence on May 30, 1872, the day when, for the first time, the Holy Sacrifice of the Mass was celebrated, and there was planted in its territory the Tree of Redemption; it is some 12 kilometers from Macharetí, with quite a rough road.

361 799 (62) At present it has a population of 800 souls. The town, made up of both infidels and neophytes, is quite neat; the buildings are not very well arranged, and the ones which merit consideration are: its tall and beautiful church, broad and well-proportioned, with its magnificent choir, gilded altars, and well-turned railings; in addition, the beautiful mechanism of double trusses which support the roof. Its house is new, of a single story, and was begun in the month of August or July in the year 1910 and dedicated in March of this year; the other buildings neither follow any arrangement nor are of any worth, and lend to the whole a rather sad appearance, but once the renovation of both towns has been completed, the planned arrangement of the buildings for instruction and workshops will be made.

(133) Its panorama has nothing in particular: to the west, the last range of the Andes, to the north and south, some rather high hills rise at a short distance and obstruct the view for the curious observer, who, frustrated in his desire to see and observe, finds a slight relief to the east, where the horizon opens out and gladdens the heart; it seems to be the older sister of the San Pascual de Boicowo Mission. The climate is in general healthy, in spite of the fact that the mission is located in a hollow, but the water, or the location of the place, dulls the understanding of its residents, according to what all the travelers note (?). /Illustration appears here./

(563) (464) (131) 6. In the years of abundance several nomadic tribes come to this mission and remain there serving the Chiriguano in exchange for food. Its elevation above sea level is 715 meters, and it is located at 20° 27' 18" south latitude and 62° 14' 44" longitude west of the meridian of Greenwich.

[text continues on p 191]

/106 cont./

Tacuiba

Because of an error in the demarcation of the boundaries with the Republic of Argentina, the town of Tacuiba is located to the south of the boundary stone, while it should be to the north, and the latter, the boundary stone, should be located precisely in Bipuru, the limit of the Chiriguano tribe, which has occupied Bolivian territory since its immigration.

Tacuiba, or Tacuigua, as the Chiriguano pronounce it, means line of the wild turkey. It is a rich region throughout; its territory is level, the streets which are being built are as straight as a line of this name, the land fertile. There are grown there the orange or pea, the garbanzo, and other cereals, which plants are irrigated with water which is relatively abundant.

The town, which also fell in the earthquake of 1899, is being rebuilt according to modern methods, and its progress is rapid. It now has a first-class hotel, where the traveler and the countryman are served with all culture and exactness, department stores, where every article is found, and permanent buildings, houses of great size, and a customs building all of stone from the walls to the roof.

The little city, in addition, is quite picturesque because of the many orange groves which continually embellish it with their green foliage and yellow fruit. /107/ which indicates the fertility of the territory and the abundance of water.

The little city is located in the territory of Tarija; consequently it was founded through Bolivian efforts. It is the seat of the subprefecture of the Gran Chaco, and today it is a cosmopolitan town, whether because of the many foreigners who have settled there or because of the many others who are continually passing through, not to mention the importance given it by the continual arrival of vehicles and that which it will receive from the proximity of the railway.

C /313 cont./
121 If the Supreme Government and the friends who have
122 helped me in this first edition continue to provide me with their considerable support, I plan to return to the region, to make better studies, to get certain data about the other tribes, to get views and panoramas with photographic cameras, and then bring out a second, more polished edition.

C Since, however, through my nomination as a Corresponding
•131 Member of the Geographical Society of this city of La Paz, I
[114] am making studies appropriate to this science, I shall set down in these pages the approximate geographical degree occupied by the known tribes which populate the extensive zone of the Bolivian Chaco.

The Chiriguano Indians are numerous from 18° 50' to 22° latitude south of the Paris meridian and from 65° to 66° 50' west longitude. However, small groups can be found at 17° 30' latitude and other groups at 22° 35' toward the south of present-day Yacuiba (2).

2. I follow the Paris meridian in placing the tribes because in the body of the work I have used the same to indicate the location of the Cayuguari Indians.

C /314/ The reader who has accompanied me as far as these
121 lines will have quite a clear idea of the Chiriguano Indians, their language, customs, and beliefs, and consequently I have nothing to add with regard to them, because this would be a repetition of what I have said. I shall say something about the others, so that Bolivians and foreigners may know the Indians with whom they are to deal.

Tapúi or Isoseños

Ce The Tapúi Indians are as many as 2,000 between children
161 and adults; they occupy both banks of the Parapiti River at 19°
131 and 19° 50' latitude and 62° 30' to 65° longitude from the Paris meridian.

Introduction.

c
ce
114

In Part I of this work I sought by a new method to analyse the material culture of two Indian tribes the Choroti and Ashluslay. In the introduction to the aforesaid work I explained the method employed. In Part 2 I have sought by the same method to make an ethno-geographical analysis of the civilization of two other Indian tribes. These are the Chiriguano and Chané, who dwell in the southernmost part of Bolivia and northernmost Argentina. The Chiriguano are Guarani Indians, while the Chané are Guaranized Arawaks[1]). They thus belong to two of the most important tribal groups in all America. Their civilisation is already well known, thanks to the missionaries who have worked and still work among them. Their works are referred to in the bibliography. The most important are those by CORRADO and NINO. DEL CAMPANA wrote a monograph on the Chiriguano based on information supplied by missionaries. We also find mention of the Chiriguano in many older works. The information they give us of their manners and customs is unfortunately scanty. It is, indeed, only in LIZÁRRAGA, CHOMÉ, VIEDMA, LOZANO and one or two of the LITTERAE ANNUEA that we find any useful matter.

can be kept in a museum or for which one may find — given favourable circumstances — archeaological comparative material. Besides weapons, ornaments etc there is thus included also burial customs, tatooing, dancing-masks, etc.

C
ce
128

The reader will find that I have endeavoured to make this part more graphic than Part I . From the maps of bibliography it will be seen regarding what regions I have had access to literature; it can also, in some measure, be seen whether the blanks on the maps are due to those particular tribes never having been closely studied.

The maps of distributions in this work are fewer in number than in Part I. This is because we find the Chiriguano and Chané, or one of these tribes, on twenty-nine maps in Part I. Part I is largely preparatory to Part II. Parts I and 2 together contain 45 maps showing the distribution of culture-elements occuring among the Chané and (or) Chiriguano.

C
ce
121

All who are interested in the ethnography of S. America will, I venture to think, find the maps worth close study and will see that from them [illegible]ious deductions can be made not only respecting the Chiriguano and Chané Indians but also as to the ethnography of S. America in general. In some measure I have, indeed, endeavoured to do this myself.

C
ce
131

The land of the Chiriguano and Chané the Indians streches from near Sta Cruz de la Sierra to near Rio Bermejo. Southwards of Sta Cruz the territory inhabited by the Chiriguano is continuous. The Chané, on the other hand, live in several different quarters, some at the river Itiyuro in the Argentine, some at Caipipendi near the Rio Pilcomayo, some at the Lower Rio Parapiti, and others near Itau south of the Rio Pilcomayo. The neighbours of the Chiriguano and Chané are the Mataco-Vejos, Mestizos, and Whites to the south, the Matacq, Toba, Tapiete, (Yanaygua) and Tsirakua to the east, to the north Mestizos and Whites, and to the west Quichua, Mestizos, and Whites.

C
ce
101
162

Some Choroti live near Vacuiba. In nearly all of the Chiriguano territory there are Mestizos and Whites. There are also several large missionary stations in their territory. Some few Chiriguano live in the village of Sta Rosa to the north of Sta Cruz de la Sierra. Some Chiriguano who sought refuge in central Chaco after their last rebellion, live there still. They are the only tribe of Chiriguano-Indians who are quite independent of the Whites. c 101 162 131 [797]

The country which is inhabited by the Chiriguano and partly by the Chané is a border land between the Andine mountains and the great plain of the Chaco. It is in the valleys between the outermost mountain ridges towards the Chaco and on the plain to the east of them that the Chiriguano and the Chané live. The land of the Chiriguano and Chané-Indians is not a real country of primeval forests. There are some great forests, but on the whole it is sparsely wooded, in places even very poorly wooded. The supply of water is the governing condition for settlement in the land of these Indians. It may be said that wherever there is access to water there the country is inhabited, at any rate as regards the region south of the Rio Grande, one of the great rivers that run through their territory There need not be a great supply of water for the Indians to find the country inhabitable. All that is necessary is sufficient drinking-water for man and beast, as at Itatique and in the Caipipendi valley near Rio Parapiti. c ce 131 135 c ce 361 312

The biggest rivers running through the territory of the Chiriguano and the Chané are the Rio Grande, the Rio Parapiti and above all the Rio Pilcomayo. The Rio Grande may now almost be considered the boundary river of these tribes towards the north, and is of but little importance to them. The Rio Parapiti is a strange river. While well supplied with water in the mountains it is almost shrinks to nothing in the plains during the dry season. During the rains it is very full of water and may be dangerous to ford. Fish are plentiful only in the Rio Pilcomayo, and we c ce 133 c ce [226]

as has been said, /169/ is not unfamiliar to the Indians. On the Rio Paraguay Arowaken /Arawak/ are also found.

The Chiriguano first lived on the lower Rio Parapiti and were driven away from there by the Chané. This is p. 80 and 81 appear here/ possibly "official history," for more probably the Chiriguano drove the Chané out of the fertile valleys of the upper Rio Parapiti. 173 648 131

Batirayu told me everything that he knew about the history of the Chané Indians on the Rio Parapiti. The last great /170/ chief was Batirayu's uncle, Aringui. He led many Indians of his tribe to Argentina to work. His predecessor was Yämbäe. Before him Ochoäpi was invested with the position of chief. In his time the whites began to push into the country. This chief is described as an important man who sought to introduce the manners and customs of the whites among his Indians. Ochoäpi is known for his extensive journeys and his persecution of sorcerers. He was said to have been in Buenos Aires. Before him Chötchori had the position of chief. In his time the whites had not yet come as far as the lower Rio Parapiti. Here the tradition comes to an end. The chiefs mentioned here were of the same family /Geschlecht/, but the rule does not pass from father to son. Ce 173 648 Ce 177

I could relate a bit of history about the Chané on the Rio Itiyuro, but I do not wish to be boring with too many names. There, too, tradition does not go back far, three generations, that is all. Ce 173

In the legends of these Indians, several of which I have given below, we learn nothing about the history of these peoples. No historical events seem to have been recast into legends there. They have entirely different themes.

It is really quite strange that among these Indian tribes their history, the names of the chiefs, have been forgotten, whereas the legends have undoubtedly been preserved, though in altered form, from generation to generation for centuries. It is chiefly the wide geographical distribution of the legends that speaks for their great age.

C /243 cont./
171 (Fig. 130) is typically Peruvian in form, as is the silver hair re-
291 mover, of which, however, I have no specimen. The festive
[534] costume of the man (Fig. 81) also seems to me to have a Peruvian
[413] cut. It is possible, however, that the influence of Peru did not
197 manifest itself among the Chiriguano until after the conquest of
the plateau by the Spanish.

e Boman (1) has proved that the Chiriguano, or more cor-

rectly the Guarani tribe to which these Indians belong, formerly extended much farther south than they do now. He found there the gave urns so characteristic of them.

C The material culture of the Chané
Ce Indians does not, in general, differ very
171 much from the culture of the Chiriguano.
Ce The Chané, on the other hand, who are
[323] more isolated on the Rio Parapiti, have
a completely independent pottery which we
C do not find again among the
[534] Chiriguano. If we compare the
[534] remaining products of Chané
C and Chiriguano industry, we do
[184] not find any greater differences than we find in the various Chiriguano villages themselves.

C For example, if one collects clay vessels in the Iguembe
323 valley and in the Caipipendi valley, both of which valleys are
184 occupied by Chiriguano, one inevitably finds that the pottery, though strongly related in ornamentation and form, nevertheless /244/ also varies locally. I have already spoken of the individual variations (p. 85).

Chané SF8

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these culturally allied tribes. After the last great Indian rebellion against the whites (in 1890), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly ground plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Parapiti.[2] The name of Chiriguano (quichua), which means «dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word «guano» is the name for the well-known bird manure found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Puna and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

The Territory of the Chiriguano

Concerning the location and extent of the territory of the Chiriguano at the time of their independence, that is, from the beginning of the 16th century to the second half of the 19th century, we have Moreno's detailed studies in two places in his work already cited many times above, the titles of which are: "Las tierras de los Chiriguanos /The lands of the Chiriguanos/" (50). According to Moreno (51), the

50. Moreno II, pp. 79-126 and pp. 200-204.

51. Moreno II, p. 206.

Chiriguano--Chiriguano /14/ of the Cordillera in contrast to the Ñationes-Guarayos and the Piringuaris also often called Chiriguano in the literature -- from the time of the Conquest until they lost their independence inhabited the same territory, that is, the western spurs of the Andes from south of the Pilcomayo up to the lands which extend on both sides of the Guapay. The Chané, who formerly had a large well-populated territory, "although they formed several partial migrations, remained in great number subject to the conquering Guaraní within the legion which these latter had converted into their impregnable abode" (52). In 1003 Father Alejandro Corrado

52. Moreno II, p. 240.

/11 cont./

Ce 131 still writes that the Chané were found scattered among the Chiriguano located among the last spurs of the Andes (53).

53. Mémoire II, p. 334.

Even after losing their independence, the Chiriguano inhabited more or less the same territory. Having known personally only Machaerti out of the territory of the Chiriguano, I here refer to the data of Erland Nordenskiöld, who came to know them in the years 1906, 1908, and 1913 and personally traveled through most of this territory, spending up to four to five months altogether in the study of the Chiriguano and the Chané (54).

C 131 [114]

54. Nord. I, p. XII.

According to Nordenskiöld (55), the territory of the

55. Nord. I, pp. XIV and XV. Cf. Métraux I, pp. 322 and 323.

Chiriguano extends from the region near Santa Cruz de la Sierra in the north to near the Bermejo River in the south. Now the Río Grande can almost be taken as the northern limit of their territory. This is the land located between the boundary of the Andes and the great plain of the Chaco, in the valleys of which the Chiriguano, and in part the Chané live. It can be said that this territory is inhabited wherever there is the necessary water, although it may be no more than enough for and their domestic animals to drink. The Chiriguano inhabit that territory contiguously, while the Chané today live in territories separated from one another. Thus some of them are on the Itiyuro River in Argentina, some are in Caipipendi, some on the lower Parapití River, and others near Itaí, south of the Pilcomayo River. Outside of the territory of the Chiriguano which has thus been circumscribed, a few Chiriguano now live in the Santa Rosa Valley north of Santa Cruz de la Sierra, and a few fled to the Chaco after the last broken revolt in 1892, WITHOUT ONE HAVING ANY INFORMATION ON THEIR SETTLING PLACE.

Ce 131

C 131 [169]

/14 cont./

131 without our having any information on their stopping place. Some Chorote live in the territory of the Chiriguano, near Yacuiba, and also, without counting the missions, the whole territory has been penetrated by whites and mestizos.

[563] [797]

131 174 According to these data given by Nordenskiöld, the territory of the Chiriguano, after their definitive subjection by the whites and up to the present time, has remained the same as that which they had at the time of their independence, except, it would seem, that they have come down more into the valleys and do not now live, as was stated in the 16th century documents, on top of the inaccessible mountains, which, as natural fortresses, offered them a secure refuge during their expeditions.

Towns and Houses

361 177 The arrangement of the towns and the form of the houses of the Chiriguano are not at the present time the primordial ones, and they have probably passed through two different transformations, one after the other, first under the influence of the architecture of Inca culture and later the architecture of the whites. /15/ According to the Annua de la Compañia de Jesús Tucumán and Peru, of the year 1596, the Chiriguano towns were composed of only a few houses that were large enough to house as many as 100 persons. In his "Descripción breve de toda la tierra del Perú, Tucumán, Rio de la Plata y Chile /A Brief Description of all the Land of Peru, Tucumán, Río de la Plata, and Chile/," Father Lizarraga (56) describes the Chiriguano

36 34 62 [113]

56. Madrid, 1909. Nueva Biblioteca de Autores Españoles, Vol. 15. Cited in Nordenskiöld.

towns in the following way: "The largest of the towns is one of five houses: the common number is three; but they are very long, more than 150 paces, with a two-sloped roof with posts in the middle, upon which the framework is constructed, and one kin group /parentela/ lives between one post and the next one."

Ce 178 643 [114] [148]

/83 cont./ when Nordenskiöld made his expedition, there was no longer a great cacique among the Chané on the Parapití River. The last great cacique had been Aringui, whose nephew, Batiraya, was a cacique, but he had refused the position of great cacique because he did not want to be too dependent on the whites (311).

311. Nord. 1, pp. 170 and 233.

C 631 [142]

According to what is said in older documents, the Chiriguano, after their immigration into the Cordillera, did not form a uniform community, a state, in the proper sense of public law. Formerly they had formed a federation of several parcialidades /subdivisions/. In the letter of Licenciado Cepeda (312) in the

C [131] [195]

312. Letter from Licenciado Cepeda giving an account of the war against the Chiriguano under the encomienda of Lorenzo Suarez de Figueroa, Governor of Santa Cruz, and under the Maestre de Campo, Fernando de Cazorra, through Tomina, and under Luis de Fuentes through Tarija. According to Moreno II, p. 113.

year 1585, it is said "that the Province of the Chiriguano, who are in the Cordillera between Santa Cruz and the city of La Plata, who are divided into three parcialidades, each distinct from the others, 25 leagues, although they communicate and help one another. One is the parcialidad of Vitupué, another that of Condorillo, and the other of Chiquiacá."

C 631 643

Of the two parcialidades Vitupué and Chiquiacá we know that they, at least originally, were each under the chieftainship of a great cacique, from whom they received their respective names. Vitupuera was the great cacique of the former and Chiaca the great cacique of the latter (313). With regard to the parcialidad

313. Moreno II, pp. 122 and 126.

/333 cont./

Chapter II

Agriculture

241 The Chiriguano, like the Guarani and the Chané, their ancestors, are excellent farmers, and the working of the soil represents their principal occupation and their great concern.
243 For them corn is of prime importance; it constitutes the basis
[273] of their diet, for it enters into the preparation of most of their dishes and in addition gives them their preferred drink, chicha or kãwi.

[132] The sandy lands of the western Chaco and its climate,
[134] hot and dry a great part of the year, but also rainy during the summer months, seem to be particularly suitable for this grain. I have never seen such beautiful fields of corn anywhere. The ears are large, well filled out /334/ with kernels, and extremely tasty. The Bolivian half-breeds and settlers who are coming in greater and greater numbers to take the place of the Indians devote themselves like them to the growing of corn, which, with cattle-raising, is their main resource.

114 My trip to the Chaco, which took place from the month
243 of February to the month of June, did not give me a chance to
[101] be present at the sowing which is done at the beginning of the rainy season. For many details I shall therefore be forced to
[127] refer to Corrado (pp. 42 and 48), Campana (pp. 96-98), Nordenskiöld (2, pp. 181-184, and 10, pp. 23-24), to Nino (pp. 237-241), and Rosen (1, p. 205).

241 When a Chiriguano wishes to cultivate a new piece of
243 ground for himself and his family, he scours the environs of his village looking for a spot which may suit him and which is, in addition, easily irrigable. This condition is generally fulfilled by the lands at the foot of a hill or rising ground. The rain water which pours down there assures them of fertility.

/3 cont./

133 The lakes are natural, but not permanent; they are
[135] many and large; in some the water is very good, but from
[132] others not even the cattle /4/ drink, because it contains so much saltpeter. They all receive water from the sky, which sometimes falls with great force and fills them at a single time. White Christians are now making artificial lakes, especially in the Gran Chaco and in the vicinity of Caipipendi.
271 When water is completely lacking, the Indian scratches the
824 ground, looking for the root of the "sipoy," samolo, which is as large as a watermelon; he cuts it at the top, squeezes the pulp with his hand, it turns to water, and he drinks; thus the need is met, but when this drink is taken for a long period, it gives rise to sickness.

311 The land lends itself to farming and to cattle raising,
312 but both industries diminish in those years when the beneficial
433 action of the rains is scarce. Then the crops are lost, and the
132 cattle die from lack of food and from the great amounts of water that they drink from the rivers and lakes on whose banks they stay through lack of energy; nonetheless this rarely happens throughout the region, which, because of embracing a wide area, in one place or another receives showers which renew nature.

Extent and Area

131 The Chiriguano tribe or race was extremely numerous and
[161] thus once took in an extraordinarily large area; traces of these
[464] Indians are found in the vicinity of Tarija, and they may be found beyond Santa Cruz, where even today Chiriguano men and women are in larger part those in domestic service with the genteel families. Toward the capital of the Republic the Indians still remember that their grandparents used to live in Tacopaya and even beyond, in Talisco, included in the same district. Then they extended toward the Bermejo River and, finally, eastward to within a few leagues of Carandaiti, where the arid zone, inhabited by the Toba and other savages, begins.

/4 cont./

131 Thus formerly the Chiriguano territory in the north was contiguous with the province of Sara, in the south and southwest with Argentina and the city of Tarija, in the west with Tarabuco country, and in the east with the colony of Carandaiti. According to its former boundaries, it then included an area of 200 leagues from north to south and southwest, and more than 90 leagues west to east.

131 16 [648] Today this extensive territory has been much reduced because of emigration, caused in part by the whites, under whose dominion most of them will not resign themselves to staying; the plagues which decimate the race have a powerful influence on its further reduction, and very soon /5/ barely the 131 name will remain. Today to the north it scarcely reaches Abapó, to the south, Itiyuru de Yacuiba, to the west, Monteagudo, and to the east, Carandaiti, some hundred leagues from north to south and about 40 from west to east.

131 648 [433] Formerly it embraced several degrees of latitude and three and a half of longitude; as they lost a considerable part of this area, so will they end up by losing it all, for despite their being heirs to the country which God had given them, as one of them was saying to me not long ago, they do not know how to farm it and improve their agriculture; they prefer to go far away and work for others rather than to own land at home. This very day only a few leagues remain in the hands of the Indians, Caipipendi in the province of Cordillera, Gutierrez Canton, and all the territory occupied by the missions, but both are likely to pass into foreign hands, because in fact the Indian is incapable of making the land that he does possess bear fruit; then the few survivors in the territory will be servants in their own house, as are so many others in lands that were once their own.

311 134 [132] The land is very unstable, at least that now occupied; it lacks stone and gravel, and since in their season the rains are torrential, they easily open cracks which in a few years become wide, deep ravines. Contributing a great deal to this are the cattle, which, because of their weight, stir up the land with their hoofs more than other livestock; for this reason

/11 cont./

133 From Igüembre Canton natural and artificial lakes begin to appear, the first ones end in Cuevo Canton and the later ones begin to appear from Buyuive, vice-Canton of Ñancaroinza, and continue through Caipipendi, Carandaiti, and Parapiti, on the right bank. Some of them may well dry up during the year, but if the rains are plentiful they will easily last until the new rainy season. The lakes are a great benefit in the arid zones, and without them there would be no life, since there is none where they are lacking; it is precisely through the lack of water that it is difficult to cross the plains of the Gran Chaco to get to Paraguay more quickly. A railroad from Santa Cruz to Isoso and from the east to Oriente in a straight line would avoid all difficulty; it would be 100 leagues through level, only slightly irregular terrain.

Climate

• 132 821 Without taking into consideration an occasional isolated exception, in the entire area or in most of it we can state as a general principle, through experience, that in the vast region inhabited by the Chiriguano race there are only two seasons of the year, called summer and /12/ winter, despite which they distinguish by name four seasons, "Aracu, Roi, Maentiha, Ipiroha," hot, cold, planting, and harvest, or summer, winter, spring, and fall.

132 The two seasons of which I speak are very marked: the summer by the abundance of rain, and the winter by drought. The first rains begin in the month of November or sometimes at the end of October, increase gradually and are frequent in the month of January, scarce in February, irregular in March, and generally stop in the month of April, or after Easter. The rains are preceded and accompanied by lightning and thunder, which fill one with fear, especially when there is added to them violent wind, and they end leaving in the air an incomparable freshness; rarely does rain fall calmly as in other parts of the world.

The rain is nearly always brought by the south wind, rarely by the others, and never or almost never by the north wind. In the area now inhabited by the Chiriguano snow is almost never seen; on rare occasions it falls in the highest

/12 cont./

•132 mountains, where it melts away in the first hours of sunlight. On June and July nights a small quantity of water will freeze, but this does not happen every year.

The temperature is quite variable everywhere, and is even irregular throughout the former area, both because of the elevation of some places and because of atmospheric accidents. The lowest temperature is 5, the highest 34, and the average 18. The hottest months are November, December, and January, and the coldest May, June, and July; nevertheless there is frost even in the months of August, September, and October, which are very oppressive because of the lack of rains to cool the atmosphere. Although the heat may be very intense in the months of November, December, and January, it is tempered by the beneficent action of the rains, which fall frequently and abundantly, but if, as happens, they cease for a relatively long period, the heat is nearly unbearable by day and insufferable at night, with sweat running off the body like a bath, which does not allow one even to think of sleeping, except in the mornings, which are always somewhat cool.

The above-noted temperature is regularly observed in the center of the area; it varies to the north, west, and southwest. In Santa Cruz the thermometer registers higher temperatures, in Padilla and Tarija lower; there are days when a thermometer placed in the sun registered 60°, and despite this it does not cause frequent sunstrokes among these Indians who wear nothing on the head for protection while they work in the fields.

/13/ In the cold months, only when the north wind dominates can very pleasant and remarkably clear days be enjoyed, but the south wind upsets it all, covering the sky with clouds and beginning the drizzle and the cold which saddens the heart, producing sickness, because the changes are very sudden, even in the rainy season. The south wind in the summer can easily bring about the loss of crops in a few days. What could be the cause of this? I have said that the rains almost always come with the south wind, but it happens that instead of rain hail will fall over much of the area; then the

/13 cont./

●132 atmosphere immediately cools down and there begins a cold wind whose chill is increased as it passes through the region of hail, and since the maize stalks are still tender they are easily stricken. The hail that falls is big, the earth is churned up, and it kills birds, sheep, goats, and other animals, if they are unable to hide in the bushes or under thick trees, but this does not happen often nor every year.

[133] Earthquakes are most rare; I felt them twice during my stay in the region, in 1899 and 1909, but the wind is sometimes so strong that it seems to make the earth tremble; there is no doubt but that it tears up trees and strips them, ruins buildings, and dismantles tiled roofs. Foreigners in this [145] so hot and changeable climate soon age and turn gray, but the natives who are used to it from childhood, despite the vices of drinking and others to which they surrender, enjoy a relatively long and healthy life.

It can readily be understood from what has been said that here the seasons of the year follow a different order from that which is seen in the Old World. Despite the fact, then, that there are no more than two seasons, we always can and ought to consider the four, in order to follow the general rule of the universe which divides the year into four parts. Summer begins December 21, fall March 21, winter June 21, and spring September 21, but all of these come ahead of time, as anyone who has lived here can testify.

Fertility

133 182 311 312 361 The Aguaragüe range, which is found to the east and one league from the Mission of San Buenaventura de Yvu, is the last one in Chiriguano territory. Small towns and families of these Indians are scattered here and there are still found east of the said range some 15 leagues away, but beyond that /14/ there are none because the area is arid and dry, "igüi utini vae," as they say, and the Chiriguano accustomed to planting maize, beans, and gourds cannot live where there is a scarcity of rain for his crops and water for his daily bath.

/14 cont./

311 The closer the traveler gets to the Gran Chaco, the less
312 water and the less fertility he finds; the very fields of Yvu
241 are patent proof, for crops are rarely abundant there. When the rains are torrential in other sections, they are sparse in Yvu; the farther to the west one travels from Aguaragüe, the more fertile is the land, because the hills and hillocks are more frequent and higher, water more abundant, and consequently the land more moist, which is necessary for agricultural production.

The fields are suitable for raising cows and horses, for the multiplication of sheep and pigs; the year when it fails to rain, however, there is lack of food for the livestock, as well as lack of water, the suffering is great, and numbers die near the waters which are found at some distance from the spots where there is feed, such as the slopes of the hills and the tops of the hillocks, abounding in tree leaves.

137 The countryside is clothed with grasses in the summer, but the region begins to turn beautiful in the spring and even earlier. The vigorous woods, dry and leafless during the cold months, begin to dress in verdant foliage at the beginning of the month of September, and in a few days nature is rejuvenated. Then it is very lovely to contemplate from some slight rise a broad pampa where there are carob trees, groves of catalpas or lapachos, the first green, the second red, and the third yellow and purple.

241 The territory is productive only in the rainy season, be-
182 cause the Chiriguano in general will not take the trouble to put
[132] in a good irrigation ditch when he can; he waits for it all from
[433] the high heavens. Miracles could have been worked on the banks of the rivers in times past; today it is difficult because they are very few and, like their grandparents, are satisfied with maize, a little sugar cane, and other delicacies, like sweet potatoes or batatas, mandioca, and peanuts.

241 Large-scale planting begins at the end of November or the
[221] beginning of December, after the country has been watered by two or three abundant rains. The maize grows very high and, when there is no lack of water, produces two or three ears on each stalk. The frijoles produce three crops. The sugar cane

/55cont./

*825 759 and not those veterans of several arrobas like gourds in the form of saddlebags, which are seen in abundance around Pozuelos, Piray, San Juan, and Pomabamba.

*136 *825 There is another large bird with the same instincts as the buzzard, called carcancho by the whites and "Caracara" by the Indians. It does not, however, kill calves; it does hunt and kill little lambs, suckling pigs, and chickens, disregarding with boldness and dissimulation the brood hen. /56/ This shameless, fearless bird is abundant everywhere and is capable of getting into kitchens and sticking its beak into the ollas; but its favorite spot is the corral, where it scratches about, looks for things, and eats, and like the most natural thing in the world it will pull out the entrails of a sleeping lamb or at the least blind it in one eye. The rascal gets into the nests of smaller birds and steals eggs or kills the young to eat them. All in all, it is a sad and ugly neighbor, with the result that all are its enemies, and some birds chase it out of their nests. Such is the practice of the bird that the Chiriguano call "Guirapipasa"; another called "Suiriri" gets on the shoulders of the carcancho and pecks it until it runs long distances.

[759] The Indians assert that carcancho fat is an efficacious remedy for the vision, and that they used it before modern medicines, which turned out to be more efficaceous and [262] active, were introduced. They eat its meat if it is fat. The [237] feathers of the carcancho and the buzzard are very strong, and [411] they put them on the ends of their arrows, so that they will not turn aside when they are shot and consequently will hit the mark better.

*136 GOLONDRINA /swallow/. -- The heat is altogether too • [132] much at certain times of the year, with the thermometer in the shade up to 32° and in the sun up to 60°, but let it not be believed that this state of heat is the normal thing. There are months of the year, and in these months there are weeks and days, in which it is difficult to endure the cold, which is most intense in June and parts or all of July. As a result of this, the swallow, even here, is a pilgrim, emigrating at the end of April and returning at the beginning of October. There are some entirely black, and there are some with white breasts. The

/123 cont./

797 religious education of the boys and girls would not make much
829 progress because their parents are in continual movement. Some
179 effort at least has been made to help them by means of the property rights which they have in the territory, about three leagues long by half a league wide, and the plan was then to build them some small chapel, but I believe that these efforts will be left in the filing cabinet for centuries to come (1).

000

1. Today, instead of missions, they are building forts for the purpose of colonization. Doubtless the epoch of a new method of colonization has arrived, but nobody is ignorant of the fact that this costs the Republic millions, while the cost of a mission is relatively nothing, and the advantages and progress incomparable. What advances are there in Crevaux, in Guachalla, and other places? What buildings are there of note and stability? None. In a single hour the Toba or any other savage may destroy them by fire. Don Fernando Guachalla, the president-elect, said it well when he said that the best and cheapest method of colonizing is that of founding missions.

175 Before the Parapiti missions were organized, those Indians
511 suffered considerable misery, because the place was quite dry
[132] in the rainy season, and they had no means of planting along the banks of the river, since the few lands there were in the
[186] hands of the whites. Father Giannecchini passed through there in 1887 as an expeditionary to Paraguay, and when he saw them so poor and so reduced in number, he exhorted them to move to some mission, but they answered that it was not easy to leave the place where they had been born and had grown old.

/253 cont./

261 feed themselves with: algarroba pods, Hibope; chañar /a legume/,
262 Cumbaru; mistol /a fruit/, Yua; tusca, Hibopene; sour algarrobos, Hibope tayi; nopal fruits, Saini; or from the fig, Iva; the higuerilla /little fig/, Caicantina, the thistle /cardo/, Tapiacaru, and the ulala /a kind of cactus/, Ñancagüína (1).

[137]
[132]

1. The fruits mentioned and many others are plentiful in the whole area, but in the Ivu region they are more plentiful; the years have now greatly changed; it does not rain as regularly as in times past and the crops are somewhat certain only at the foot of the mountain ranges.

181 Indubitably the Chiriguano, although superior to other nomadic tribes that surround them or border them, are very unfortunate and poor, but, on the other hand, their life is peaceful, they bother no one, and they do not wish to be bothered. When the Chiriguano Indian has food, he is the happiest being on earth; his savage bliss can today be envied by all the rulers and great of the world who live without knowing whether or not they will wake up on the morrow, in view of being surrounded by so many anarchistic dangers, so many bombs and dynamite that the obscure sects make explode, so many excesses that occur and are reported in the newspapers, and so many deaths that are taking place. Oh, this kind of savagery has not penetrated among these savages! That is why they sleep peacefully without fear, in the town, in the countryside, and in the forest, and they are happier than others; those who seek bliss on this earth may well envy these Indians.

SF10 Chiriguano SF10
Chane SF8

c ce 133 226 shall see that the methods of fishing differ somewhat in the different rivers. At the Rio Pilcomayo the Indians must always have found a good supply of food. As many Chiriguano live by very insignificant streams they never have the opportunity of fishing. The Chané all live in places where they are able to procure fish during some part of the year at least. c ce [361]

c ce 224 Big game is scarce in the land of the Chiriguano and Chané. Nor are these Indians keen huntsmen. One seldom sees game that has been killed by them in their huts. c ce [223] The great flocks of fat pigeons that settle in their fields are for the most part left unmolested.

c ce 241 243 As we shall see in the following the Chiriguano and Chané live mostly by tilling the ground. Owing to the comparative dryness of their land maize is cultivated more than anything else. It is the ease with which this plant can be grown here, that makes the land of the Chiriguano and Chané a good land to dwell in.

c ce 222 The fruit of the carob-tree (algarrobo) is the most important wild fruit. Probably no careful study has ever been made of the climatic conditions of the Chiriguano and Chané country. c ce ●132 It is situated in the tropics, north of the tropic of Capricorn and the traveller there of course suffers more from heat than cold. In May and June especially, however, when there is a strong south wind, it is agreeable to have a well built house, warm clothes and a snug bed. The rains begin in December and leave off in April or May. c ce [244] It sometimes happens that there is little or no rain and then the crops are a failure. They are often destroyed by grasshoppers.

/153 cont. /

In the dry season the wind heaps large dunes along the banks of the river. After it has left the mountains, it does not receive a tributary. The Rio Parapiti is very wide, but never deep. During the driest period its bed is transformed into a sand desert where the wind plays with the fine river sand. When it storms, the sand is swept across the bottom of the river. If one wishes to cross it on such days, one may perhaps not get his feet wet, but he must shield his eyes. C 133 132

The Rio Parapiti is rich in fish, but the fish are tiny. The banks are quite fertile, but inasmuch as they are flooded during the rainy season, the harvests are easily lost. Often in the dry season everything is wasted by the scorching droughts. The locusts, too, hawk about in these regions and leave behind in their own unappetizing bodies a poor substitute for what they have destroyed. C 13

On the Rio Parapiti, high up in the mountains, live the Quichua Indians, then come the Chiriguano, beyond them, near the river, the Tapiete, also called Yanaygua, then the Chané, and finally, in the unknown wilderness, the Tsirakua Indians. C 101

My first visit on the Rio Parapiti was paid to Father Carmelo, who had a small mission station there among the Chiriguano. I became very fond of this monk; /154/ he had such confidence-inspiring friendliness. He is one of the missionaries who are needed here, people who desire and are able to sacrifice themselves for others, who show an equally great friendship toward all. C 114 797

I now continued along the Rio Parapiti to Isiporenda on the north bank of the river. The Tapiete live opposite Isiporendo. I shall later describe a visit that I made to them. C 114 T [131]

At Isiporenda I met the first Chané, or, as they are called here, Tapuy. I then visited most of their villages. I made the acquaintance especially of some of their storytellers, of whom Batirayu, the nephew of the last great chief, Aringui, became my good friend. Ce 114 [101 538 123]

From the lower Rio Parapiti I proceeded by way of Charagua, a village inhabited almost exclusively by whites, to the Caipipendi valley, where I stayed with the Chiriguano chief Taruiri. C 114

/154 cont./

One might be surprised that a person would want to live in this treeless valley, where one finds only salty, dirty water, but in the Caipipendi valley one need not drink water, for here the maize yields magnificent harvests and there is never a shortage of maize beer. The inhabitants of the Caipipendi valley are wealthy, and if there is famine in other regions, the Indians come from afar to these kinsmen, in order to barter their valuables for maize. 13 243 273 556 437 731

For the collector, too, it is a magnificent valley. We found silver ornaments, silver bowls, finely carved musical instruments, and many other rare articles in this ethnographer's paradise. Stone axes, ruins, diggings /Grabfelder/ of various peoples prove that the Caipipendi valley has long been highly prized by the Indians. 126.

The water has cut deeply into this valley. In the rainy season it probably rains there too. 133 132

From Caipipendi I returned over the mountains, through a /155/ valley famous for its hot springs and its beauty, to Charagua, to continue then along the Andes in the direction of Santa Cruz de la Sierra. 114 [312]

It was October, 1908. Not quite a year later, in July, 1909, I again visited the Chaco, after extensive river journeys far beyond, on the border of Brazil. In another book I shall describe these journeys on large, navigable rivers and through virgin forests whose luxuriant green is overpowering.

From Santa Cruz de la Sierra I returned, as was said, to the Chaco in July, 1909. I then traveled first of all by way of the Rio Grande to the Rio Parapiti, chiefly to visit my friend Barirayu.

The Rio Grande is the southernmost tributary of the Amazon River. It comes from the highest mountains of the Andes and flows past Sucre, a city that has long contended with the city of La Paz for the rank of capital of Bolivia. When it emerges from the mountains, it is a roaring, mighty river. Farther down it has an extremely changeable, very little known course. North of Santa Cruz de la Sierra the Rio Grande receives the Rio 133

/155 cont./ C
Piray and finally unites with the Rio Mamoré. A few Chiriguano 133
live along this river, and savage Tsirakua and Siriono also [101]
rove about in the forests along it. C

Between the Rio Grande and the Rio Parapiti there is a 133
region with an extreme scarcity of water and largely covered 137
with completely impenetrable underbrush and low scrub forest 312
full of caraguata and cacti. This monotonous, dismal vegetation is interrupted here and there by hills and grassy plains. C

Besides the savage Tsirakua Indians who make these thickets 136
unsafe, one finds another curiosity here, namely the guanaco C
(Auchenia). It is altogether strange to find an animal like the [132]
guanaco, which one thinks of only in connection with the cold plateaus of the Andes or the /156/ pampas of Patagonia, often afflicted with frost, in this bush which is frequently scorched by droughts. It would be interesting to be able to determine whether this guanaco of the tropical forest is really the same as the one known from the colder regions. Intelligent whites with whom I have discussed this and who have seen both regard them, however, as the same species.

Having returned to the Rio Parapiti, I looked up Batirayu, Ce 115
with whom I had already become intimately acquainted in 1908 and who also speaks excellent Spanish.

With no other Indians with whom I became acquainted did I become as close as with Batirayu. He understood that I was collecting the old mementos out of an interest in his tribe. Batirayu did his best to explain to me the religious conceptions of his tribe. In the evening we used to sit in his room with a cigarette, and he told about olden times, sorcerers, chiefs, Ce and spirits. Occasionally an old chief, Böyra, also came, and [122] from him I heard many charming Chané legends. We would sit until far into the night and chat by a flickering light that I had with me in order to take notes. Ce

One would be very much mistaken if he were to believe that 115
the conversations with these men were merely an interesting 123
study. I felt comfortable with these fine, tactful, yes, why not, cultured human beings. It was genuinely refreshing after coming from the often vulgar, empty whites.

/159 cont./

things. The ceramics /160/ which I found there belong among the very best that I saw among these Indians (Figs. 77 and 78).

From Maringsy I returned to Ivu by way of the mission station of Santa Rosa. It has a wonderful location. Like an old fortress, it is built on a narrow hill. Below it, in long rows, lie the grayish-brown Chiriguano huts surrounded by low woods of Mimosaceae, cacti, small algarrobas, and other fine-leaved trees. This woodland is seldom so dense than one cannot easily get out of it without a bush knife. When I was in Santa Rosa,

Fig. 78. Clay vessel made by the wife of the Chiriguano chief Maringsy. 1/7.

it was the dry season and everything was burned up. Here too, however, rain probably entices the green out of the dry earth. Sometimes the rain is so long in coming, however, that the Indians do not get any maize and that means -- hunger.

From Santa Rosa one looks far out over the mountains and across the great plain of Boyuovit, over the country that was the native land of the Chiriguano, where, at Curuyuqui, they fought their last battle with the Christians, who assume the right to rob all weaker peoples.

After my excursion to Maringsy I left the land of the Chiriguano and Chané and paid my second visit, already described in this book, to the Chorotí and Ashluslay.

/186 cont./ Ea 226

Another method of fishing often used in the aforementioned river is to dam up longish pools in the sand, in which fish gather. After the water is emptied out of the pools, the fish are caught. Sometimes the pool is made to terminate in a channel closed off with a scoop net /Kescher/, from which the fish cannot escape. Ea

All the fishing that I saw on the Rio Itiyuro was done during the dry season, on hot, sunny days. [132]

On the upper Rio Pilcomayo the Chiriguano fish with fishhooks obtained from the whites, with nets similar to the dip nets of the Chorotí, though smaller, and by shooting the fish with bow and arrow. The arrows used for fishing have two or more points. C 226 [197] [411]

Fig. 90. Fishing with calabash. Rio Itiyuro.

Ea 226

On the Rio Parapiti I saw Chaná and Chiriguano fishing with a net of the type illustrated here (Fig. 91). In shooting fish, the Chiriguano there use arrows with many flat points. C [411]

In these last-named rivers the men always fish in deeper water with nets and with bow and arrow, whereas the women are common to catch small fish where the water is dammed when the river is half dry. Ea

Not infrequently the Indians undertake long journeys in order to fish. Thus, the Chaná sometimes during the /186/ dry season visit the swamps "Madrejones" in which the Rio Parapiti disappears. 226 [384] [38]

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these culturally allied tribes. After the last great Indian rebellion against the whites (in 1892), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly ground plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Paraguay.[2] The name of Chiriguano (quichua), which means «dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word «guano» is the name for the well-known bird manure-found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Pano and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

[127]

/363 cont./

234 To end up, one could still cite among Chiriguano food
262 the cheese they make in some villages. Each time they
butcher they take care to keep the abomasus in order to make
[177] milk separate. Chiriguano cheeses are of the same quality as
those of the half-breeds, who for once have taught something
[272] to our Indians. I shall add that I have never seen a Chiriguano
drink milk.

312 The problem of water does not come up for the Chiriguano
● 133 as for the other Indians of the Chaco. Numerous rivers cross
their territory, and several of them are large enough not to dry
up even in the middle of the dry season. These watercourses
form innumerable quebradas, gorges or valleys, which give
its characteristic aspect to the country inhabited by our Indians.
[361] Sometimes villages are built near springs or small lakes, like
the Ivu mission, which is provided with plenty of water.

312 When I crossed the Caipipendí valley, the river which
occupies the bottom was nearly dry. The Indians had scooped
out small wells about one meter in depth in the sand of its
bed. They had surrounded them with slabs of stone to prevent
any caving in and to preserve the water which accumulated in
them from the heat of the sun. In this same valley, in a village
situated on top of a hill, the Indians had dug a cistern four to
five meters in diameter in which rain water had collected.

271 The Chiriguano have found a way to purify the muddy
312 water they often have to drink. They crush caraguatá leaves
824 between two stones, then steep them in the water, and all its
impurities settle as a result of the action of the juice of this plant.

264 The Chiriguano do not eat at set times. They make a
rather substantial breakfast very early in the morning and again
take some food toward the middle of the day. In the evening
[562] about six o'clock they make a kind of dinner. Since the men
are served first, then the women and children, it follows that
the meals drag out in length. At any moment of the day one
[415] can see someone eating. The food /364/ is presented to each
one in a calabash or terra-cotta bowl which each holds on his
knees. They pick up the pieces with their fingers but imbibe
liquids with a wooden spoon (Figs. 42 and 43). After eating,
they wash their hands. I have seen some rinse out their mouths.

/2 cont./

121 elegant or labored, natural or stilted, which can be observed in one book by a single author. But the fact is that I can only write it here, since only the Indians are able to smooth out the difficulties which naturally will arise in the course of these pages.

I am familiar with almost the entire region inhabited by the Chiriguano, with the exception of a few small areas, but this is of little importance, as much because they are not of historical importance as because I have obtained data about them which show them to be like the rest. It would even be easy to make a map of the region, but I am embarrassed to say that I am not competent to do this.

General View

• 133 The region which the Chiriguano Indians occupy today is composed of many little valleys /cañadas/ which run from north to south; they are separated by mountain ridges which vary in size, height, precipitous slopes, deep gorges, and incalculable depths. Its length is quite considerable, while its breadth is not over 180 kilometers. The mountains rise to 3,000 meters and more above sea level, but at that altitude there is no longer any vestige of forest, while at 1,200 meters the woods are exuberant.

In the midst of the valleys low hills cross in every direction, and there are some which from a distance look like larger hills or on their way to becoming such; others are completely isolated and quite small, but they attract the attention of the traveler because of their conical shape, like the traditional "Tunparepoti", located at the beginning of the
[262] pampas of Yvu. There is no hill which does not make room upon its breast for a multitude of trees of every size and description, like a grove, and /3/ another multitude of vines like the bejuco and low-lying plants of the cactus family, which the Indian uses by eating their fruit, whose combined acridness and sweetness would make them please and be preferred by the most aristocratic lady of the city of Paris.

/3 cont./

133 The Indian makes full use of the valleys, laying out his
136 field with its own fence; his cow also grazes there, with her
311 calf running and playing across the level ground, and the wild animals live everywhere there, the dauntless foxes, the inoffensive anteaters, and the timid little deer /corzuelas/, while the monkeys seek the woods and the brambly, craggy ground of the hills to entertain themselves in raucous clamor, and the condors love to soar through the air to an extraordinary height, even considering that they launch themselves from the peaks of the highest hills.

133 While the ridges run from north to south, the course of the rivers is quite capricious; they run to the north, regress southward, direct themselves eastward, advance intrepidly westward, but the dominant course of them all as far as the pampas of the Gran Chaco is from west to east, overcoming every difficulty set in their way by the ridges, from which they leap with an extraordinary din, such as at the "Pirapo" (cataract of the fishes) or the waterfalls of the Pilcomayo and Parapiti rivers.

In the land of the Chiriguano, torrents and streams abound; more numerous are the rivulets which quickly lose their waters because within a few kilometers they run into endless sandy areas. If the hidden water should fail to appear occasionally in the ravines, which are small arroyos in origin, life here would be all but impossible, since places like Yvu, which without having a river or anything similar, possesses abundant and excel-
312 lent water, are numbered. The springs which appear in the beds
[157] of the torrents are of the greatest benefit in those places where there are no lakes or ponds, for the Indian, because of his laziness, is not capable of building artificial lakes for his water
[484] supply. In Itatiqui, for instance, not long ago there was a group of some 150 Chiriguano families; they could have made a lake in order to have such a necessity, but neither did they do it nor will they on their own initiative, and they go five kilometers to get it or at least there is the Chiriguano woman with her jug waiting for the forming of the drops which exude from the western slope, from which comes the name "Itatiqui," the stone that drips.

/3 cont./

133 The lakes are natural, but not permanent; they are
[135] many and large; in some the water is very good, but from
others not even the cattle /4/ drink, because it contains so
[132] much saltpeter. They all receive water from the sky, which
sometimes falls with great force and fills them at a single
time. White Christians are now making artificial lakes,
especially in the Gran Chaco and in the vicinity of Caipipendi.
271 When water is completely lacking, the Indian scratches the
824 ground, looking for the root of the "sipoy," samolo, which is
as large as a watermelon; he cuts it at the top, squeezes the
pulp with his hand, it turns to water, and he drinks; thus the need
is met, but when this drink is taken for a long period, it gives
rise to sickness.

311 The land lends itself to farming and to cattle raising,
312 but both industries diminish in those years when the beneficial
433 action of the rains is scarce. Then the crops are lost, and the
132 cattle die from lack of food and from the great amounts of
water that they drink from the rivers and lakes on whose banks
they stay through lack of energy; nonetheless this rarely happens throughout the region, which, because of embracing a
wide area, in one place or another receives showers which renew nature.

Extent and Area

131 The Chiriguano tribe or race was extremely numerous and
[161] thus once took in an extraordinarily large area; traces of these
[464] Indians are found in the vicinity of Tarija, and they may be
found beyond Santa Cruz, where even today Chiriguano men and
women are in larger part those in domestic service with the
genteel families. Toward the capital of the Republic the
Indians still remember that their grandparents used to live in
Tacopaya and even beyond, in Talisco, included in the same
district. Then they extended toward the Bermejo River and,
finally, eastward to within a few leagues of Carandaiti, where the
arid zone, inhabited by the Toba and other savages, begins.

/5 cont./

311 in certain valleys that are narrow or not too wide there is
134 scarcely room for fields, because so many little ravines have been formed. Such is the valley of Huacaya Canton; if there lived in it today the multitude of Indians which formerly were there, it would be hard to find, because of the woods and the ravines, sufficient land in the tiny level places for all the fields of maize, French beans, and gourds which they value much for food and gifts; only for other elements would a little valley be very desirable, were it not all owned.

Hills or Mountains

● 133 Chiriguano territory, because it is very extensive, as has already been seen, is quite varied; from Talisco to Monteagudo and from Tarija to the salt flats of O'Connor Province in the city of Entreríos it is very mountainous and few are the places which extend far enough to form a level place of a few leagues. Although there are /6/ no very high hills, between the two hills which limit the valleys there is an infinity of low hills of all sizes in height, width, and length.

The pampas begin imperceptibly from Monteagudo in the west and from Aguairenta, where the Gran Chaco begins; said pampas from Monteagudo little by little grow larger or again become small as the ridges permit, until they reach the last cordillera, which is found to the east of the Mission of San Buenaventura de Yvu, at a distance of one league, behind which begin the immense plains of the Gran Chaco, where the horizon becomes lost.

The principal mountains are: Padilla, called through antonomasia "The Hill," because its configuration is the same one that is called "Curi" toward San Juan del Pirai (1).

> 1. The hill is different from the Curi, because the former is more an enormous rock which ends in the ranges of Limon.

At this point the road across the hill is very rough and long, but if it is rather long toward Padilla, it is, by contrast, as

/6 cont./

133 comfortable to go down as to go up, if an occasional short
[241] section be excepted. The hill of Padilla attracts the attention of
[361] all; there grow and ripen well both potatoes and maize, and the hill is sprinkled on both sides with houses of all sizes. From January to May the fields give it a quite picturesque and pleasing appearance as it rises some 2,340 meters above sea level, for which reason no doubt it is unforested with the trees which are found nearby growing exuberantly on the plain toward Monteagudo along the rivulet called Limón.

Next come the hills called Huacangui, Bartolo, and Cazaderos, the first two found on the right bank and the latter on the left bank of the Acero River, which touches the slopes of the last named; the three have no peculiarity, only that they are tree covered, rather high, and the road through
[136] them is very bad. Cazaderos Hill abounds in jaguars, and it is the same hill which must be crossed or climbed in order to go from San Juan del Piray to San Pablo de Huacareta; before one climbs this hill near San Juan, there is another small one called Ñañoloma, which attracts the attention of all because it is very narrow, low, and straight; it is a straight line which rises in the middle of the valley and continues without ending to the southeast; the Piray and Parapiti rivers wash the base of Ñañolama.

/7/ Monteagudo has a somewhat irregular plain, but it is not interrupted by hills until three leagues away, that is, at the Parapiti River in Matara, where there is another hill renowned only because it is a road and an extremely bad one. The Parapiti River bathes it at its base, and along the river itself the way is very boldly opened through the hard rock, forming a waterfall there; this same hill must be climbed to leave Ingre Canton, as well as Igüembe, where the passage is also quite rough.

133 From Matara to Ivu there are hills and rises of little im-
173 portance, if one makes an exception of the hills of Itiranti,
648 Saararenta, and Incahuasi, which last separates the province of Acero from that of Cordillera; on Incahuasi there are an infinite number of ruins of fortresses and houses, which, according to what they say and the name Incahuasi, "Inca's House," was an encampment of Quechua Indians, when, at the orders

/7 cont./

133 [173] [648] of one of their emperors, they tried to conquer all the Chiriguano, but they had to halt at the top of said hill without daring to go down to the pampas of Caraparicito, where they were awaited by all the Indians, allied with the Toba.

Cuevo, like all of the cantons of the frontier, is shut in by two ridges, that of Saararenta to the west and that of Aguaragüe to the east, the latter being the last one which is found; it is quite high, measuring 1,500 meters, and with it end the cordilleras in the east, giving way to the plains of the Bolivian Chaco.

From the peak of Aguaragüe the view is most delightful; to the right can be seen the picturesque panorama of Cuevo Canton with its hills, lakes, fields, forests, and stream, which, with its sand, looks like an immense ribbon of homespun twisting through the entire region, and to the left extend the immense plains, lost to view in the distance. From this peak can be seen the lakes and fields of Carandaiti, until the horizon is lost in the pampas inhabited by the savages.

The above-named ranges of the former and present territory of the Chiriguano continue to the north and south to Santa Cruz and Tarija and Argentina, assuming different names in each place, but they are ramifications of the renowned Andes. I have crossed the last one, Aguaragüe, to Santa Cruz, and it passes north of that city, as well as on the southwest toward Tarija and O'Connor Province, ending in Tartagal in the Argentine Republic.

/8/ Rivers and Lakes

It can easily be understood that this immense area and extent of land, crossed from north to south by so many mountains of all heights and dimensions and by a great number of hills in every direction, would be furrowed with rivers, torrents, streams, brooks, and abundant springs, while in the Gran Chaco all of these disappear and natural and artificial lakes and ponds begin to appear.

/8 cont./

133 The rivers which bathe the Chiriguano region are four; the Pilcomayo, the Parapiti, the Grande or Guapay River, and the Acero. The Pilcomayo begins in the northwest of Potosí Department and crosses Chiriguano country in the southeast. Its water, sweet and clear up to the southern part of [135] Igüembe Canton, is somewhat salty in Huacaya and Villamontes, because to the southeast of Ibopeiti it receives as a tributary the Salado River with its rather abundant waters; these waters are quite salty, because they pass through the salt flats of O'Connor Province. Its bed is wide and shallow, but its flow is very abundant from December to April, because this is the rainy season. If in Villamontes the Germans or others open the great canal proposed by the Supreme Government, the navigation of this river up to the estuaries /esteros/ of the P. Patiño, even in small boats, will be made nearly impossible, because there will not be enough water for it.

136 In the Pilcomayo fish are abundant: bagre, shad /sábalo/, and dorado; some of the latter are very large, up to a meter and a half in length. The first freshets of the rainy season wash up and kill many fish, leaving them stretched out on the ground on both banks or piling them up like stones or firewood. Then 226 the Chiriguano Indians, the Toba, and Mataco fill their houses, and dogs and crows come there by the thousands and stuff themselves, while the air is full of unbearable miasmas.

[221] The most satisfactory and safest season for fishing is from the May cold until the end of July and in certain years up to [251] the middle of August; then all the Indians are fishermen; they fish for themselves and for trading; they open the fish though the middle vertically and dry it in the sun. If nobody goes [438] there to barter, they go off to sell it at 20 centavos apiece, [435] but generally during the fishing season the tribes far from the rivers go to the banks of same, taking maize or parched meal and bringing back abundant fish. /Illustration appears here./

/facing p. 9/

● 133

Parapiti River

/9/

157 The banks of the Pilcomayo are difficult for the opening
181 of canals because they are quite high, but it must also be
185 admitted that the Indians do not concern themselves with
[133] progress, are not ambitious like the whites who have settled on its banks; the latter also, because of being few, poor, and of limited means, almost all prefer to get rich with little work and little outlay of money, for which reason they devote themselves to raising cattle and hogs, which thrive without much care or expense.

133 The Parapiti is the second river named; it contains less water than the first and in Pomabamba, where it begins, it is very insignificant, but ten leagues farther, or after it has crossed Curi Ridge, it already begins to be respectable, and in front of the town of San Juan del Piray it appears as a ferocious beast ready to do battle with a weaker adversary, like the Armado River, whose waters it stops or makes recede, just as a lackey halts in the presence and at the sight of his master.

This river runs from west to east with few digressions as far as Mariqui in Parapiti Canton, whence it goes north and from its beginning it crosses the central part of Chiriguano country. In San Juan del Piray the river is some 12 leagues from the Pilcomayo; both rivers could easily be joined to make them one, for which there was once a project, but it would cause much harm to agriculture, especially in Cordillera Province, and the Pilcomayo would have the slight advantage of an increase in flow which would perhaps make it navigable from Villamontes to the Esteros.

In San Juan del Piray the Parapiti River receives as tributaries the Armado and the Piray rivers, and beyond San Pablo de Huacareta the waters of the river of Sauces and several others join it. Thus the Parapiti is a river of some consideration, and its bed is very dangerous at nearly every crossing because of the absolute lack of stone, especially from the Missions of San Antonio and San Francisco to Isoso Canton.

/9 cont./

133 [312] [231] At this point the river disappears completely from the month of June to December or January, forcing the farmers to make great excavations in its bed in order to be able to water their livestock; they have to go down to five meters in certain places. The course of the now dry river is easily seen, because in the season of great floods it leaves on the bank all the trash which it drags along and in its bed all the sand; the waters reappear to form the San Miguel River in the province of Velasco.

133 312 /10/ The benefit that agriculture and cattle raising draws from the Parapiti is indisputable; without it the existence of Parapiti and Isoso cantons would be almost impossible. All the wealth of both areas would disappear, there would be no livestock, sugar plantations, or rice fields as there are now on both banks, which lend themselves marvelously to the opening of canals and irrigating the sugar-cane fields which abound there. Nevertheless, the extraordinary floods of certain years do much damage, making plantations and their equipment disappear almost completely.

136 This river contains few fish; there are only bagre and shad and others of little value; the big dorados do not exist and there are only a few small ones in its tributary, the Piray River, but strangely they do not enter the Parapiti; at the confluence they go back. Below the San Francisco Mission the fish disappear, because the water diminishes until it almost all disappears near Mariqui.

241 31 312 In Isoso maize is planted in the month of June in order to harvest the crop before the beginning of the big floods which inundate it all, and during the rainy season they are content to sow frijoles, gourds, melons, and watermelon far from the riverbed, but fruit is not always produced, since the region is rather arid. The waters of this river are quite sweet, and this must be one reason why agriculture is very vigorous on its banks, as any traveler can see.

/10 cont./

• 133 The Guapay or Grande River is the third river that I mentioned. in Cordillera it is called Abapó and Guapay, or the Valiente River by the Chiriguano; it begins in Cochabamba Department, waters Arque Province, and crosses the northern part of the Chiriguano region, washing a part of Cordillera Province. It passes through Santa Cruz and mixes its waters with those of the Mamoré; its sweet and clear waters contain a great abundance of fish.

The banks of this river in Cordillera Province easily allow the opening of canals to make the adjacent lands fertile. There on the left bank, especially in Abapó and Cabezas, it seems that the river is inviting man to make use of its waters by irrigating great stretches of land. What wealth the Republic would have were a foreign colony to be established on the banks of this river! But as long as there is no method of transportation by the construction of railroads, all progress is impossible; it is impossible to think of colonies, /11/ because the immigrant neither comes on foot nor is he accustomed to eating only parched or stewed maize or squash with beans.

The Acero River is a tributary of the above. Its source is beyond Supachuy, and some four or five leagues from the town it is already a torrent; its waters operate many mill wheels, are clear and fresh, abound in fish, shad, bagre, dorado, and many others. The bed of the Acero is full of rocks, doubtless because it runs through rather rugged hills and hillocks; only in the rainy season is it dangerous to cross it, because then it is full of water and turbulent; at other times it can be crossed without the least concern.

In addition to these four main rivers there is another multitude of brooks and streams which contain abundant water, so long as they do not run far from the hills or do not fail to run between rocky slopes, but as soon as they arrive at sandy ground they are lost, and then, just in order to drink, it is necessary to make more or less deep excavations. In Acero Province in Ticucha Canton there is the rivulet called Taperilla which comes from far away and converts that district into a delight and makes it very productive; great plantations of all kinds of plants and productive crops could be made there.

/11 cont./

•133 From Igüembre Canton natural and artificial lakes begin to appear, the first ones end in Cuevo Canton and the later ones begin to appear from Buyuive, vice-Canton of Ñancaroinza, and continue through Caipipendi, Carandaiti, and Parapiti, on the right bank. Some of them may well dry up during the year, but if the rains are plentiful they will easily last until the new rainy season. The lakes are a great benefit in the arid zones, and without them there would be no life, since there is none where they are lacking; it is precisely through the lack of water that it is difficult to cross the plains of the Gran Chaco to get to Paraguay more quickly. A railroad from Santa Cruz to Isoso and from the east to Oriente in a straight line would avoid all difficulty; it would be 100 leagues through level, only slightly irregular terrain.

Climate

132 821 Without taking into consideration an occasional isolated exception, in the entire area or in most of it we can state as a general principle, through experience, that in the vast region inhabited by the Chiriguano race there are only two seasons of the year, called summer and /12/ winter, despite which they distinguish by name four seasons, "Aracu, Roi, Maentiha, Ipiroha," hot, cold, planting, and harvest, or summer, winter, spring, and fall.

132 The two seasons of which I speak are very marked: the summer by the abundance of rain, and the winter by drought. The first rains begin in the month of November or sometimes at the end of October, increase gradually and are frequent in the month of January, scarce in February, irregular in March, and generally stop in the month of April, or after Easter. The rains are preceded and accompanied by lightning and thunder, which fill one with fear, especially when there is added to them violent wind, and they end leaving in the air an incomparable freshness; rarely does rain fall calmly as in other parts of the world.

The rain is nearly always brought by the south wind, rarely by the others, and never or almost never by the north wind. In the area now inhabited by the Chiriguano snow is almost never seen; on rare occasions it falls in the highest

/13 cont./

132 atmosphere immediately cools down and there begins a cold wind whose chill is increased as it passes through the region of hail, and since the maize stalks are still tender they are easily stricken. The hail that falls is big, the earth is churned up, and it kills birds, sheep, goats, and other animals, if they are unable to hide in the bushes or under thick trees, but this does not happen often nor every year.

[133] Earthquakes are most rare: I felt them twice during my stay in the region, in 1899 and 1909, but the wind is sometimes so strong that it seems to make the earth tremble; there is no doubt but that it tears up trees and strips them, ruins buildings, and dismantles tiled roofs. Foreigners in this [145] so hot and changeable climate soon age and turn gray, but the natives who are used to it from childhood, despite the vices of drinking and others to which they surrender, enjoy a relatively long and healthy life.

It can readily be understood from what has been said that here the seasons of the year follow a different order from that which is seen in the Old World. Despite the fact, then, that there are no more than two seasons, we always can and ought to consider the four, in order to follow the general rule of the universe which divides the year into four parts. Summer begins December 21, fall March 21, winter June 21, and spring September 21, but all of these come ahead of time, as anyone who has lived here can testify.

Fertility

133 182 311 312 361 The Aguaragüe range, which is found to the east and one league from the Mission of San Buenaventura de Yvu, is the last one in Chiriguano territory. Small towns and families of these Indians are scattered here and there are still found east of the said range some 15 leagues away, but beyond that /14/ there are none because the area is arid and dry. "igüi otini vae," as they say, and the Chiriguano accustomed to planting maize, beans, and gourds cannot live where there is a scarcity of rain for his crops and water for his daily bath.

/75 cont./

194 167 They could have emigrated from their land of residence and followed the course of the Paraguay River on its right bank, arriving at Curumbá, and then across the salt flats of San José, coming to the places which they occupy today, but the stretch is longer, the water to be found is scarce, and over great stretches there is no trace of anything which /76/ might verify their emigration over this route, if indeed they would not have been attacked en route by the numerous nomads thereabouts.

[133] [34] It is necessary to conclude that they followed the banks of the Pilcomayo River: this rapid stream starts in the interior of the Bolivian Republic, crosses through the entire Chiriguano region, and empties into the Paraguay: its banks from near Azurduy up to Villa Montes is a straight line of more than 50 leagues, all populated by Indians who are clearly Chiriguano. From Villa Montes to Guachalla near the Esteros del Padre Patiño there are Choroti and Tapiete, who, with slight differences, speak the Chiriguano language: this stretch has plenty of water, fish, and fruit and is shorter than the above-mentioned one. Dr. Campos followed the banks of this river in order to arrive in Paraguay: Colonel Rivas, the Frenchman Crevaux, and the Spaniard Ibarreta followed the Pilcomayo River on their expeditions; they failed not through a lack of food or water, but some because they felt sure of the goodness of the Indians, and others because they had a very small force with them. All of these circumstances clearly show that the Chiriguano must have come into Bolivia along the banks of the Pilcomayo; the tribes along the way could not have offered them much difficulty, because their number was extraordinary; hardship on the travel rations was so insignificant that it allowed them to fight with vigor and bravery, and finally their attitude was peaceful (1).

1. Colonel Rivas and the Frenchman Crevaux were killed by the Toba, and Ibarreta by other Indians.

/87 cont./

797 the climate is very healthy, but the lack of food is continual, and they must often eat the roots of the serpentine arum, or mangara, bitter and poisonous before it is cooked (2).

2. Flora Cruceña of R. Peña. The fire makes it lose the poisonous part, but not all of the bitterness.

The buildings are constructed on a level site located on a small rise. The panorama which runs from north to northeast is [133] extensive and pleasant; there in the distance can be seen the hills of Taremacua and the cordillera of Ururigua, through which Nature opened a gateway to give passage to the waters of the Parapiti River, which fearlessly and with great boldness hurls itself from a great height, forming by its imposing waterfall a lake of white foam, like a boll of wild cotton, and then following its rapid course through San Antonio, Mariqui, Cumbarui, and Isoso, /88/ where it is completely lost. Still farther beyond, to [137] the north and northwest, in the midst of a thick forest of quebrachos, [133] thickets, and secular algarrobas, are seen the tops of the ranges of Salinas and Timboirenta and something of Incahuasi, and at a short distance from the town is seen a round hill called "Tunpa repoti," the Chiriguano history and meaning of which I am not ignorant, and in front of the mission house, at the distance of half a league, are the pampas of Curuyuqui located among algarrobas and other trees; up to here the panorama of Yvu is similar to that of green Umbria of the kingdom of Italy. The [137] picture is dismal to the west and south, because the heart is oppressed by a consideration of the sands of the desert, however, much the springs of the west suggest the ancient and capricious fountains of the temples of Arcadia. Nevertheless, in the rainy season the hills and the plains garb themselves with fresh grass and wild flowers, lending to the nearby horizon a pleasant and varied appearance. The town is located at 770 meters above sea level, and at 20° 44' 35" south latitude, and 65° 50' 7" longitude west of the meridian of Paris, according to what is recorded in the

View of the Santa Rosa Mission

/101 cont./

361 797 1. Machareti. -- Father Jerónimo de la Peña was the first to enter Machareti, but, before he could begin any work, death intervened, and only after a century, that is, in the year 1869, could the Cross of Redemption be raised, around which began to gather the settlers dispersed by the war and the death of Captain Taruncunti, not very friendly to the missionaries.

[162] Before the mission had been founded for ten years, it numbered more than 3,000 souls, but today it is much smaller, [167] its inhabitants reaching 1,500. Emigration to the Republic [464] of Argentina is a real plague for this area, because the principal recruiters of Indians for work outside of Bolivian territory are there, and it is useless to cite laws, because there are clever interpreters; meanwhile all wail for workers.

361 [133] Machareti has a delightful and picturesque panorama; to the north and to the east the human eye cannot take in the immensity of the plains or the exuberance of the woods and the variety and caprice of the hills. The town is located on a great plain, but is now quite reduced; its buildings, atop a high hill which dominates everything; it has a beautiful church with painting and /102/ gildings, a mission house of two stories, two great halls, with their respective patios, for instruction, and a third one for the music school, and also other buildings for shops (1).

361 797 131 1. When the Machareti mission was founded, it cut off the retreat of the bellicose Huacayeños, who were coming into the Gran Chaco by the Chorro road, some 15 leagues from Huacaya and some 12 from Ivu; its altitude above sea level is 771 meters and it is located at 20° 49' 58" south latitude and 63° 3' 44" longitude west of the meridian of Greenwich.

/102 cont./

797 2. Tigüipa. -- This mission, dedicated to the universal Patron of the Church, the Patriarch St. Joseph, began its existence on May 20, 1872, the day when, for the first time, the Holy Sacrifice of the Mass was celebrated, and there was planted in its territory the Tree of Redemption; it is some 12 kilometers from Machareti, with quite a rough road.

361 797 [162] At present it has a population of 800 souls. The town, made up of both infidels and neophytes, is quite neat; the buildings are not very well arranged, and the ones which merit consideration are: its tall and beautiful church, broad and well-proportioned, with its magnificent choir, gilded altars, and well-turned railings; in addition, the beautiful mechanism of double trusses which support the roof. Its house is new, of a single story, and was begun in the month of August or July in the year 1910 and dedicated in March of this year; the other buildings neither follow any arrangement nor are of any worth, and lend to the whole a rather sad appearance, but once the renovation of both towns has been completed, the planned arrangement of the buildings for instruction and workshops will be made.

[133] Its panorama has nothing in particular: to the west, the last range of the Andes, to the north and south, some rather high hills rise at a short distance and obstruct the view for the curious observer, who, frustrated in his desire to see and observe, finds a slight relief to the east, where the horizon opens out and gladdens the heart; it seems to be the older sister of the San Pascuál de Boicovo Mission. The climate is in general healthy, in spite of the fact that the mission is located in a hollow, but the water, or the location of the place, dulls the understanding of its residents, according to what all the travelers note (2). /Illustration appears here./

[563] [464] [131] 2. In the years of abundance several nomadic tribes come to this mission and remain there serving the Chiriguano in exchange for food. Its elevation above sea level is 715 meters, and it is located at 20° 27' 18" south latitude and 62° 14' 44" longitude west of the meridian of Greenwich.

/The corrections in the list on p. 333 have been made in the text of the translation. Page 333 continues with the following note concerning the end map./

101 Note: The map which is found at the end of the work con-
102 tains the following errors: (1) the juntas of San Antonio should
103 be of San Francisco; (2) the line which comes out of Cuevo
131 toward the Azero River is not a river, but a dividing line between
133 Santa Cruz and Sucre; (3) the missions of the Parapiti occupy
361 the left bank of said river; (4) Ibo occupies the right bank of the
797 Cuevo River; (5) the projected city of Manso should be near the bank of the Pilcomayo River.

SF10 Chiriguano SF10
Chane SF8

Some Choroti live near Yacuiba. In nearly all of the Chiriguano territory there are Mestizos and Whites. There are also several large missionary stations in their territory. Some few Chiriguano live in the village of Sta Rosa to the north of Sta Cruz de la Sierra. Some Chiriguano who sought refuge in central Chaco after their last rebellion, live there still. They are the only tribe of Chiriguano-Indians who are quite independent of the Whites.

The country which is inhabited by the Chiriguano and partly by the Chané is a border land between the Andine mountains and the great plain of the Chaco. It is in the valleys between the outermost mountain ridges towards the Chaco and on the plain to the east of them that the Chiriguano and the Chané live. The land of the Chiriguano and Chané-Indians is not a real country of primeval forests. There are some great forests, but on the whole it is sparsely wooded, in places even very poorly wooded. The supply of water is the governing condition for settlement in the land of these Indians. It may be said that wherever there is access to water there the country is inhabited, at any rate as regards the region south of the Rio Grande, one of the great rivers that run through their territory There need not be a great supply of water for the Indians to find the country inhabitable. All that is necessary is sufficient drinking-water for man and beast, as at Itatique and in the Caipipendi valley near Rio Parapiti.

The biggest rivers running through the territory of the Chiriguano and the Chané are the Rio Grande, the Rio Parapiti and above all the Rio Pilcomayo. The Rio Grande may now almost be considered the boundary river of these tribes towards the north, and is of but little importance to them. The Rio Parapiti is a strange river. While well supplied with water in the mountains it is almost shrinks to nothing in the plains during the dry season. During the rains it is very full of water and may be dangerous to ford. Fish are plentiful only in the Rio Pilcomayo, and we

Schwedenskiöld E-A/(1908-1908, 1912) 1908
SF10 Chiriguano SF10 ●
Chaco SF1

C
Ce
●133 shall see that the methods of fishing differ somewhat in
226 the different rivers. At the Rio Pilcomayo the Indians must always have found a good supply of food. As many Chiriguano live by very insignificant streams they never have the opportunity of fishing. The Chané all live in places
C
Ce
[361] where they are able to procure fish during some part of the year at least.

C
Ce
224 Big game is scarce in the land of the Chiriguano and Chané. Nor are these Indians keen huntsmen. One sel-
C
Ce
[223] dom sees game that has been killed by them in their huts. The great flocks of fat pigeons that settle in their fields are for the most part left unmolested.

C
Ce
247 As we shall see in the following the Chiriguano and
243 Chané live mostly by tilling the ground. Owing to the comparative dryness of their land maize is cultivated more than anything else. It is the ease with which this plant can be grown here, that makes the land of the Chiriguano and Chané a good land to dwell in.

C
Ce
222 The fruit of the carob-tree (algarrobo) is the most im-
C
Ce
132 portant wild fruit. Probably no careful study has ever been made of the climatic conditions of the Chiriguano and Chané country. It is situated in the tropics, north of the tropic of Capricorn and the traveller there of course suffers more from heat than cold. In May and June especially, however, when there is a strong south wind, it is agreeable to have a well built house, warm clothes and a snug bed.
Ce
[244] The rains begin in December and leave off in April or May. It sometimes happens that there is little or no rain and then the crops are a failure. They are often destroyed by grasshoppers.

/152 cont./
earings with real "diamonds," rings with "sapphires," or other 123
fine things, which she could then show off at the next drinking bout. 439
There are always two villages in these mission stations, 437
one for the heathens, one for the Christians. I myself always felt 361
more comfortable in the former, and this not only because more 797
fine, old things were to be collected there, but also because the people there were friendlier, more tactful, and more polite in their behavior. The mission children were importunate and impudent.

Near Macharetí there is a large basin-shaped valley through 133 ●
which flows a little brook that probably swells to a roaring river after a violent tropical rain and disappears in the wilderness of the Chaco. Quite near the mission it leaves the handsomely dissected
mountains, where small petroleum springs trickle out everywhere [135]
in the crevices of the cliffs. Then it flows through a hilly landscape that gradually turns into the vast flat area of the Chaco. The vegetation in these regions is not very luxuriant. The wood- 137
land, when such is present, is sparse, low, shrubby, and monoto- 241
nous. The fields seem to produce abundant harvests, the drought seldom too long. These regions are often devastated by huge 731
swarms of locusts. I have seen these destructive animals cover the 156
woodlands like large, reddish-brown clouds.

From Macharetí we went by way of Itatiquí, a very interesting 114
Chiriguano village in an arid region, to the Río Parapití.

The latter comes from Pomabamba and Sauces, from the 133
/153/ mountains of the Quichua /Quechua/ Indians. After it has left these, in the rainy season, it is a roaring stream overflowing its banks. In the dry season it carries little water. The Río Parapití also ends in the Chaco. During the rainy season it is lost in the swamps; in the dry season it disappears in the fine sand. If the Río Parapití parades on the maps, as the southernmost tributary of the Amazon River, this is only empty boasting on its part. The woodlands along the Río Parapití consist mostly of 137
bushes and low, fine-leaved trees, caraguata, and cacti.

/153 cont./

In the dry season the wind heaps large dunes along the banks of the river. After it has left the mountain, it does not receive a tributary. The Rio Parapiti is very wide, but never deep. During the driest period its bed is transformed into a sand desert where the wind plays with the fine river sand. When it storms, the sand is swept across the bottom of the river. If one wishes to cross it on such days, one may perhaps not get his feet wet, but he must shield his eyes. C 153 132

The Rio Parapiti is rich in fish, but the fish are tiny. The banks are quite fertile, but inasmuch as they are flooded during the rainy season, the harvests are easily lost. Often in the dry season everything is wasted by the scorching drought. The locusts, too, hawk about in these regions and leave behind in their own unappetizing bodies a poor substitute for what they have destroyed. C 13

On the Rio Parapiti, high up in the mountains, live the Quichua Indians, then come the Chiriguano, beyond them, near the river, the Tapiete, also called Tanaygua, then the Chané, and finally, in the unknown wilderness, the Tsirabua Indians. C 101

My first visit on the Rio Parapiti was paid to Father Carmelo, who had a small mission station there among the Chiriguano. I became very fond of this monk. /154/ he had such confidence-inspiring friendliness. He is one of the missionaries who are needed here, people who desire and are able to sacrifice themselves for others, who show an equally great friendship toward all. C 114 147

I now continued along the Rio Parapiti to Itiparenda on the north bank of the river. The Tapiete live opposite Itiparenda. I shall later describe a visit that I made to them. C 114 [151]

At Itiparenda I met the first Chané, or, as they are called here, Tapuy. I then visited most of their villages. I made the acquaintance especially of some of their maryollem, of whom Batiraya, the nephew of the last great chief, Aringui, became my good friend. C 114 [181 538 123]

From the lower Rio Parapiti I proceeded by way of Charagua, a village inhabited almost exclusively by whites, to the Caipipendi valley, where I stayed with the Chiriguano chief Tarairi. C 114

/154 cont./

One might be surprised that a person would want to live in this treeless valley, where one finds only salty, dirty water, but in the Caipipendi valley one need not drink water, for here the maize yields magnificent harvests and there is never a shortage of maize beer. The inhabitants of the Caipipendi valley are wealthy, and if there is famine in other regions, the Indians come from afar to these kinsmen, in order to barter their valuables for maize. 13 243 273 556 437 731

For the collector, too, it is a magnificent valley. We found silver ornaments, silver bowls, finely carved musical instruments, and many other rare articles in this ethnographer's paradise. Stone axes, ruins, diggings /Grabfelder/ of various peoples prove that the Caipipendi valley has long been highly prized by the Indians. 126.

The water has cut deeply into this valley. In the rainy season it probably rains there too. 133 132

From Caipipendi I returned over the mountains, through a /155/ valley famous for its hot springs and its beauty, to Charagua, to continue then along the Andes in the direction of Santa Cruz de la Sierra. 114 [312]

It was October, 1908. Not quite a year later, in July, 1909, I again visited the Chaco, after extensive river journeys far beyond, on the border of Brazil. In another book I shall describe these journeys on large, navigable rivers and through virgin forests whose luxuriant green is overpowering.

From Santa Cruz de la Sierra I returned, as was said, to the Chaco in July, 1909. I then traveled first of all by way of the Rio Grande to the Rio Parapiti, chiefly to visit my friend Batirayu.

The Rio Grande is the southernmost tributary of the Amazon River. It comes from the highest mountains of the Andes and flows past Sucre, a city that has long contended with the city of La Paz for the rank of capital of Bolivia. When it emerges from the mountains, it is a roaring, mighty river. Farther down it has an extremely changeable, very little known course. North of Santa Cruz de la Sierra the Rio Grande receives the Rio 133

/155 cont./ C
Piray and finally unites with the Rio Mamoré. A few Chiriguano 133
live along this river, and savage Tsirakua and Siriono also [101]
rove about in the forests along it. C

Between the Rio Grande and the Rio Parapiti there is a 133
region with an extreme scarcity of water and largely covered 137
with completely impenetrable underbrush and low scrub forest 312
full of caraguata and cacti. This monotonous, dismal vegetation is interrupted here and there by hills and grassy plains. C

Besides the savage Tsirakua Indians who make these thickets 136
unsafe, one finds another curiosity here, namely the guanaco C
(Auchenia). It is altogether strange to find an animal like the [132]
guanaco, which one thinks of only in connection with the cold plateaus of the Andes or the /156/ pampas of Patagonia, often afflicted with frost, in this bush which is frequently scorched by droughts. It would be interesting to be able to determine whether this guanaco of the tropical forest is really the same as the one known from the colder regions. Intelligent whites with whom I have discussed this and who have seen both regard them, however, as the same species. Ce

Having returned to the Rio Parapiti, I looked up Batirayu, 115
with whom I had already become intimately acquainted in 1908 and who also speaks excellent Spanish.

With no other Indians with whom I became acquainted did I become as close as with Batirayu. He understood that I was collecting the old mementos out of an interest in his tribe. Batirayu did his best to explain to me the religious conceptions of his tribe. In the evening we used to sit in his room with a cigarette, and he told about olden times, sorcerers, chiefs, Ce
and spirits. Occasionally an old chief, Bóyra, also came, and [122]
from him I heard many charming Chané legends. We would sit until far into the night and chat by a flickering light that I had with me in order to take notes. Ce

One would be very much mistaken if he were to believe that 115
the conversations with these men were merely an interesting 123
study. I felt comfortable with these fine, tactful, yes, why not, cultured human beings. It was genuinely refreshing after coming
from the often vulgar, empty whites.

/157 cont./ One old woman who was supposed to know Chané very well said she would teach me after she had reached the realm of the dead. Since the Indians in this happy place are not bothered by whites, and not by ethnographers either, the promise of the old woman was not very friendly. Ce 124 197 123 Ce

The Chané use their old language for many expressions that are abusive, for example, karitimisôyti, which they translate as son of a w---e. An invitation to coitus is called pocône. There are also songs in their /158/ old language, for example, siparakinânoyé, siparakinânoyé, siparakinânoyé, tonéya, tonéya, tonéya, which they did not know how to translate. 195 197 Ce [533] C

From the Rio Parapiti I again visited the Chiriguano chief Taruiri in the Caipipendi valley, where I sought to buy as many old ornaments and other valuables as possible. Besides Taruiri I also visited another chief, Yumbay, an old worthy who was always embracing me and saying: "I am Yumbay." /Fig. 77 appears here./ "Yes, the great, mighty Yumbay," I chimed in, which made the poor reduced fellow feel very flattered. 114 126 C [123] C

From the Caipipendi valley I went by way of Pipi to the mission at Ivu. This lies in an arid, lonely region with little water, near several huge mountains, and the life there must be dreadful. When smallpox was very prevalent in the region, Father Bernardino successfully prevented the disease from spreading into the mission by vaccinating all the Indians living at the place. Father Bernardino is a truly unselfish human being, a genuine missionary. As a result of the vaccination, no one in Ivu died of smallpox, whereas the sinister disease raged frightfully among the whites a few miles from the station. It almost served them right. If anyone died of smallpox, the corpse was laid on a table decorated with paper flowers and a crucifix. Around this the other swine would get drunk and /159/ continue to drink obligos (1) until they were finally lying on the table. 797 164 [114] [133] [312] C [764] C [273]

1. If a person drinks obligo with another, the latter must drink up. C [576]

/159 cont./
In the village of Cuevo alone 60 out of 200 persons died within a short time. I visited the 140. They were as gay as ever. Spirits and beer were consumed in quantities. 114 64 [65] [273]

Father Bernardino was never given credit for this work, but rather the medicine men, who had bewitched the sickness so that it would not come to Ivu. The white colonists, too, occasionally had the medicine men come in order to /Fig. 78 appears here/ drive away the sickness. They did not believe in the vaccine either. 797 756

With Ivu as the starting point, I made a trip into the 114

415
531

Fig. 77. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/6.

Igüembe valley, in order to visit the Chiriguano chief Maringay. 114 It was a charming ride on horseback up on the high crests and down into deep valleys, through an often grandiose, colorful landscape. These valleys are poor in forests. Only in a well-protected ravine in which a brook trickles forth is the vegetation luxuriant. [133] [137]

I soon became very good friends with old Maringay. The old man was conservative, clung to the old customs, and felt that the Indians should be on good terms with the whites, but should preserve their old habits and customs unchanged. His village was extraordinarily interesting and very rich in old, fine things. 123 157 173 643 000

/159 cont./

things. The ceramics /160/ which I found there belong among 323
the very best that I saw among these Indians (Figs. 77 and 78).

From Maringay I returned to Ivu by way of the mission station 361
of Santa Rosa. It has a wonderful location. Like an old fortress, 797
it is built on a narrow hill. Below it, in long rows, lie the [114]
grayish-brown Chiriguano huts surrounded by low woods of [342]
Mimosaceae, cacti, small algorrobas, and other fine-leaved [137]
trees. This woodland is seldom so dense than one cannot easily
get out of it without a bush knife. When I was in Santa Rosa, 132

415
531

Fig. 78. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/7.

it was the dry season and everything was burned up. Here too, 132
however, rain probably entices the green out of the dry earth.
Sometimes the rain is so long in coming, however, that the [731]
Indians do not get any maize and that means -- hunger.

From Santa Rosa one looks far out over the mountains and 133 ●
across the great plain of Boyuovis, over the country that was 648
the native land of the Chiriguano, where, at Curuyuqui, they
fought their last battle with the Christians, who assume the
right to rob all weaker peoples.

After my excursion to Maringay I left the land of the 114
Chiriguano and Chané and paid my second visit, already
described in this book, to the Choroti and Ashluslay.

/160 cont./

The region settled by the Chiriguano and Chané Indians is really very extensive. It is varied in nature, from luxuriant virgin forests to extremely arid valleys and plains poor in vegetation. It is in part very mountainous, but the Chiriguano and Chané are not mountain people. They stay down in the valleys and do not climb up to the peaks and plateaus, like the Quichua Indians.

Animal life in these regions is poor, in fact, very poor. A hunting people could never live there. Now and then a roebuck, a wild pig, a few ostriches, that is all one sees in the way of big game. Bird life, too, is very poor. /161/ The number of lakes is very small, and they are no larger than what we would call pools in Europe. On the Rio Parapiti one sees quite a large number of white egrets (1), famous for

1. Ardea.

their valuable feathers. With regard to wood fowl, only the chicken called "pavas" (2) contributes to the diet. Occasionally

2. Penelope.

one sees a large-billed "toucan" (3). Sleek pigeons, fattened

3. Rhamphastus.

on maize, often live in masses in the fields of the Indians. In the Rio Pilcomayo there is a great abundance of fish; in the little rivers the fish are small and poor. The Indians who live in these regions have to be farmers, and they are maize farmers to the highest degree. For them maize is food, drink, pleasure, everything!

I have no adventures to report from among these Indians. Everyone may travel unharmed among them. The greatest sorrow of the ethnographer is that he is unable to collect all the interesting and old things that he sees there. One cannot take everything home.

/185 cont./

Ee 226

Another method of fishing often used in the aforementioned river is to dam up longish pools in the sand, in which fish gather. After the water is emptied out of the pools, the fish are caught. Sometimes the pond is made to terminate in a channel closed off with a scoop net /Ketscher/, from which the fish cannot escape. C Ee

All the fishing that I saw on the Rio Itiyuro was done during the dry season, on hot, sunny days. [132]

On the upper Rio Pilcomayo the Chiriguano fish with fishhooks obtained from the whites, with nets similar to the dip nets of the Choroti, though smaller, and by shooting the fish with bow and arrow. The arrows used for fishing have two or more points. C 226 [199] [411]

C Ee 226

Fig. 90. Fishing with calabash. Rio Itiyuro.

On the Rio Parapiti I saw Chané and Chiriguano fishing with a net of the type illustrated here (Fig. 91). In shooting fish, the Chiriguano there use arrows with many fine points. C [411]

In these last-named rivers the men always fish in deeper water with nets and with bow and arrow, whereas the women are content to catch small fish where the water is dammed when the river is half dry. Ee

Not infrequently the Indians undertake long journeys in order to fish. Thus, the Chané sometimes during the /186/ dry season visit the swamps "Madrejones" in which the Rio Parapiti disappears. 226 484 [33]

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these culturally allied tribes. After the last great Indian rebellion against the whites (in 1890), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly gourd plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Parapiti.[2] The name of Chiriguano (quichua), which means »dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word »guano» is the name for the well-known bird manure-found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Puna and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

343

Fig. 188. Part of a Chiriguano village. Two small pile-buildings, used as maize-barns can be seen between the huts. Ibitibi. Bolivia. Photo. E. v. R.

343 The granaries for storing maize are always built on pole supports
417 (figs. 188 and 192). Fig. 191 2 shows a step-ladder leaning against a tree.
[322] Step-ladders of this kind, usually hewn out of a single piece of wood, are used by the Chiriguano as means of access to these pole-supported granaries.

174 Baron E. Nordenskiöld, who has made a valuable analysis of the distribution
342 of pile-buildings in South America[2], considers that when pile-buildings occur among a tribe inhabiting a region not exposed to inundations, then the idea of constructing buildings raised on piles has generally originated at the time when the tribe inhabited some other region, either a swamp,

Chapter II

Agriculture

241 The Chiriguano, like the Guarani and the Chané, their ancestors, are excellent farmers, and the working of the soil represents their principal occupation and their great concern.
243 For them corn is of prime importance; it constitutes the basis
[273] of their diet, for it enters into the preparation of most of their dishes and in addition gives them their preferred drink, chicha or kāwi.

[132] The sandy lands of the western Chaco and its climate,
[134] hot and dry a great part of the year, but also rainy during the summer months, seem to be particularly suitable for this grain. I have never seen such beautiful fields of corn anywhere. The ears are large, well filled out /334/ with kernels, and extremely tasty. The Bolivian half-breeds and settlers who are coming in greater and greater numbers to take the place of the Indians devote themselves like them to the growing of corn, which, with cattle-raising, is their main resource.

114 My trip to the Chaco, which took place from the month
243 of February to the month of June, did not give me a chance to
[101] be present at the sowing which is done at the beginning of the rainy season. For many details I shall therefore be forced to
[127] refer to Corrado (pp. 42 and 48), Campana (pp. 96-98), Nordenskiöld (2, pp. 181-184, and 10, pp. 23-24), to Nino (pp. 237-241), and Rosen (1, p. 205).

241 When a Chiriguano wishes to cultivate a new piece of
243 ground for himself and his family, he scours the environs of his village looking for a spot which may suit him and which is, in addition, easily irrigable. This condition is generally fulfilled by the lands at the foot of a hill or rising ground. The rain water which pours down there assures them of fertility.

/4 cont./

131 Thus formerly the Chiriguano territory in the north was contiguous with the province of Sara, in the south and southwest with Argentina and the city of Tarija, in the west with Tarabuco country, and in the east with the colony of Carandaiti. According to its former boundaries, it then included an area of 200 leagues from north to south and southwest, and more than 90 leagues west to east.

131 16 [648] Today this extensive territory has been much reduced because of emigration, caused in part by the whites, under whose dominion most of them will not resign themselves to staying; the plagues which decimate the race have a powerful influence on its further reduction, and very soon /3/ barely the 131 name will remain. Today to the north it scarcely reaches Abapó, to the south, Riyuru de Tacuba, to the west, Montenagudo, and to the east, Carandaiti, some hundred leagues from north to south and about 40 from west to east.

131 [48] [433] Formerly it embraced several degrees of latitude and three and a half of longitude; as they lost a considerable part of this area, so will they end up by losing it all, for despite their being heirs to the country which God had given them, as one of them was saying to me not long ago, they do not know how to farm it and improve their agriculture; they prefer to go far away and work for others rather than to own land at home. This very day only a few leagues remain in the hands of the Indians, Caipipendi in the province of Cordillera, Gutierrez Canton, and all the territory occupied by the missions, but both are likely to pass into foreign hands, because in fact the Indian is incapable of making the land that he does possess bear fruit; then the few survivors in the territory will be servants in their own house, as are so many others in lands that were once their own.

31 134 [152] The land is very unstable, at least that now occupied; it lacks stone and gravel, and since in their season the rains are torrential, they easily open cracks which in a few years become wide, deep ravines. Contributing a great deal to this are the cattle, which, because of their weight, stir up the land with their hoofs more than other livestock; for this reason

/5 cont./

311 134 in certain valleys that are narrow or not too wide there is scarcely room for fields. because so many little ravines have been formed. Such is the valley of Huacaya Canon: if there lived in it today the multitude of Indians which formerly were there. it would be hard to find. because of the woods and the ravines. sufficient land in the tiny level places for all the fields of maize. French beans. and gourds which they value much for food and gifts: only for other elements would a little valley be very desirable. were it not all owned.

Hills or Mountains

133 Chiriguano territory. because it is very extensive. as has already been seen. is quite varied: from Talisco to Monteagudo and from Tarija to the salt flats of O'Connor Province in the city of Entre/ín it is very mountainous and few are the places which extend far enough to form a level place of a few leagues. Although there are /6/ no very high hills. between the two hills which limit the valleys there is an infinity of low hills of all sizes in height. width. and length.

The pampas begin imperceptibly from Monteagudo in the west and from Aguaiventa. where the Gran Chaco begins: said pampas from Monteagudo little by little grow larger or again become small as the ridges permit. until they reach the last cordillera. which is found to the east of the Mission of San Buenaventura de Yvo. at a distance of one league. behind which begin the immense plains of the Gran Chaco. where the horizon becomes lost.

The principal mountains are: Padilla. called through antonomasia "The Hill. " because its configuration is the same one that is called "Curi" toward San Juan del Piraí (1).

1. The hill is different from the Curi. because the former is more an enormous rock which ends in the ranges of Limon.

At this point the road across the hill is very rough and long. but if it is rather long toward Padilla. it is. by contrast. as

/3 cont./

133 The lakes are natural, but not permanent; they are
[135] many and large; in some the water is very good, but from
[132] others not even the cattle /4/ drink, because it contains so much saltpeter. They all receive water from the sky, which sometimes falls with great force and fills them at a single time. White Christians are now making artificial lakes, especially in the Gran Chaco and in the vicinity of Caipipendi.
271 When water is completely lacking, the Indian scratches the
824 ground, looking for the root of the "sipoy," samolo, which is as large as a watermelon; he cuts it at the top, squeezes the pulp with his hand, it turns to water, and he drinks; thus the need is met, but when this drink is taken for a long period, it gives rise to sickness.

311 The land lends itself to farming and to cattle raising,
312 but both industries diminish in those years when the beneficial
433 action of the rains is scarce. Then the crops are lost, and the
132 cattle die from lack of food and from the great amounts of water that they drink from the rivers and lakes on whose banks they stay through lack of energy; nonetheless this rarely happens throughout the region, which, because of embracing a wide area, in one place or another receives showers which renew nature.

Extent and Area

131 The Chiriguano tribe or race was extremely numerous and
[161] thus once took in an extraordinarily large area; traces of these
[464] Indians are found in the vicinity of Tarija, and they may be found beyond Santa Cruz, where even today Chiriguano men and women are in larger part those in domestic service with the genteel families. Toward the capital of the Republic the Indians still remember that their grandparents used to live in Tacopaya and even beyond, in Talisco, included in the same district. Then they extended toward the Bermejo River and, finally, eastward to within a few leagues of Carandaití, where the arid zone, inhabited by the Toba and other savages, begins.

/8 cont./

133 The rivers which bathe the Chiriguano region are four; the Pilcomayo, the Parapiti, the Grande or Guapay River, and the Acero. The Pilcomayo begins in the northwest of Potosí Department and crosses Chiriguano country in the southeast. Its water, sweet and clear up to the southern part of [135] Igüembe Canton, is somewhat salty in Huacaya and Villamontes, because to the southeast of Ibopeiti it receives as a tributary the Salado River with its rather abundant waters; these waters are quite salty, because they pass through the salt flats of O'Connor Province. Its bed is wide and shallow, but its flow is very abundant from December to April, because this is the rainy season. If in Villamontes the Germans or others open the great canal proposed by the Supreme Government, the navigation of this river up to the estuaries /esteros/ of the P. Patiño, even in small boats, will be made nearly impossible, because there will not be enough water for it.

136 In the Pilcomayo fish are abundant: bagre, shad /sábalo/, and dorado; some of the latter are very large, up to a meter and a half in length. The first freshets of the rainy season wash up and kill many fish, leaving them stretched out on the ground on both banks or piling them up like stones or firewood. Then 226 the Chiriguano Indians, the Toba, and Mataco fill their houses, and dogs and crows come there by the thousands and stuff themselves, while the air is full of unbearable miasmas.

[221] The most satisfactory and safest season for fishing is from [251] the May cold until the end of July and in certain years up to the middle of August; then all the Indians are fishermen; they fish for themselves and for trading; they open the fish though [438] the middle vertically and dry it in the sun. If nobody goes [435] there to barter, they go off to sell it at 20 centavos apiece, but generally during the fishing season the tribes far from the rivers go to the banks of same, taking maize or parched meal and bringing back abundant fish. /Illustration appears here./

/144 cont./

Genii

776 171 Where ignorance dominates, superstition is the result, I imagine, since all the tribes adjacent to the Chiriguano must believe in the existence of genii or owners of certain places who, not to offend anybody, are even accepted by some members of the white race, especially when dealing with buried treasures. This is not the least strange, since before the arrival of Christ all humanity, except for the Hebrews, believed in this, and even today in those places where the light of the Gospel has not penetrated a belief in genii prevails, even among enlightened people, because only the Gospel dissipates /illustration appears here/ /145/ the mists from the soul and destroys error, consequences of the fall of the first man.

778 776 In Chiriguano the tutelar genii of a place are called Iya, owner in the literal sense. If the Chiriguano pass by places where there is some genie, they find it difficult to approach, and if one asks them where there might be some limestone or gypsum, they will not tell for fear of the Iya, who would take revenge by killing the Chiriguano who caused the place watched over by the genie to be discovered. If something useful must be taken from such a place, they do it with the permission of the Iya (1).

[278] [317] [231]

1. The presence of the Iya in places where petroleum is found is undeniable for the Chiriguano. They will take what is absolutely necessary of this liquid to cure the sores of their horses, cows, etc.

●135 When the San Buenaventura Mission was founded, the missionary made every effort to try to find gypsum and limestone, but no Indian was willing to tell where it was abundant. Nevertheless, by chance, while the foundations of the church were being built, it was discovered that many of the stones being used were of hydraulic lime, an abundant vein of which was found about 300 meters from the church itself on top of a hill. Gypsum up to today has not been found in the areas thereabouts for the same reason, but there are signs of its presence. In

797

The Santa Rosa Mission Band

135 /145 cont./
Caraparirenta there is an occasional stone of this, which has been brought there by water.

In Huacaya Canton, along the shores of the Pilcomayo on the lower slopes of the hills of Oriente, it is asserted that there must be mines or deposits of gold. A stream brings little nuggets to [648] certain places. Almost all the whites there say that the Indians pick up these nuggets, sell some of them, and work others into rings or earrings for their wives, but up to now, however hard the whites have tried to discover the place, they have never found an Indian who would take them (2).

776
778

2. They say that in the woods on the peak of a small hill there are two bells hanging from a tree and in another place a building with two

/152 cont./
earrings with real "diamonds," rings with "sapphires," or other 123
fine things, which she could then show off at the next drinking bout. 439
There are always two villages in these mission stations, 437
one for the heathens, one for the Christians. I myself always felt 361
more comfortable in the former, and this not only because more 797
fine, old things were to be collected there, but also because the people there were friendlier, more tactful, and more polite in their behavior. The mission children were importunate and impudent.

Near Machareti there is a large basin-shaped valley through 133
which flows a little brook that probably swells to a roaring river after a violent tropical rain and disappears in the wilderness of the Chaco. Quite near the mission it leaves the handsomely dissected [135] •
mountains, where small petroleum springs trickle out everywhere in the crevices of the cliffs. Then it flows through a hilly landscape that gradually turns into the vast flat area of the Chaco. The vegetation in these regions is not very luxuriant. The wood- 137
land, when such is present, is sparse, low, shrubby, and monoto- 241
nous. The fields seem to produce abundant harvests, the drought seldom too long. These regions are often devastated by huge 731
swarms of locusts. I have seen these destructive animals cover the 136
woodlands like large, reddish-brown clouds.

From Machareti we went by way of Itatiqui, a very interesting 114
Chiriguano village in an arid region, to the Rio Parapiti.

The latter comes from Pomabamba and Sauzes, from the 133
/153/ mountains of the Quichua /Quechua/ Indians. After it has left these, in the rainy season, it is a roaring stream overflowing its banks. In the dry season it carries little water. The Rio Parapiti also ends in the Chaco. During the rainy season it is lost in the swamps; in the dry season it disappears in the fine sand. If the Rio Parapiti parades on the maps, as the southernmost tributary of the Amazon River, this is only empty boasting on its part. The woodlands along the Rio Parapiti consist mostly of 137
bushes and low, fine-leaved trees, caraguata, and cacti.

●136
825

/For a listing of the various types of native fauna in the Chiriguano area and their cultural recognition and use by the people, see category 116, pp. 50-93./

/3 cont./

133 The Indian makes full use of the valleys, laying out his
136 field with its own fence; his cow also grazes there, with her
311 calf running and playing across the level ground, and the wild animals live everywhere there, the dauntless foxes, the inoffensive anteaters, and the timid little deer /corzuelas/, while the monkeys seek the woods and the brambly, craggy ground of the hills to entertain themselves in raucous clamor, and the condors love to soar through the air to an extraordinary height, even considering that they launch themselves from the peaks of the highest hills.

133 While the ridges run from north to south, the course of the rivers is quite capricious; they run to the north, regress southward, direct themselves eastward, advance intrepidly westward, but the dominant course of them all as far as the pampas of the Gran Chaco is from west to east, overcoming every difficulty set in their way by the ridges, from which they leap with an extraordinary din, such as at the "Pirapo" (cataract of the fishes) or the waterfalls of the Pilcomayo and Parapiti rivers.

In the land of the Chiriguano, torrents and streams abound; more numerous are the rivulets which quickly lose their waters because within a few kilometers they run into endless sandy areas. If the hidden water should fail to appear occasionally in the ravines, which are small arroyos in origin, life here would be all but impossible, since places like Yvu, which without having a river or anything similar, possesses abundant and excel-
312 lent water, are numbered. The springs which appear in the beds
[157] of the torrents are of the greatest benefit in those places where there are no lakes or ponds, for the Indian, because of his laziness, is not capable of building artificial lakes for his water
[484] supply. In Itatiqui, for instance, not long ago there was a group of some 150 Chiriguano families; they could have made a lake in order to have such a necessity, but neither did they do it nor will they on their own initiative, and they go five kilometers to get it or at least there is the Chiriguano woman with her jug waiting for the forming of the drops which exude from the western slope, from which comes the name "Itatiqui," the stone that drips.

/6 cont./

133 comfortable to go down as to go up, if an occasional short
[241] section be excepted. The hill of Padilla attracts the attention of
[361] all; there grow and ripen well both potatoes and maize, and the hill is sprinkled on both sides with houses of all sizes. From January to May the fields give it a quite picturesque and pleasing appearance as it rises some 2,340 meters above sea level, for which reason no doubt it is unforested with the trees which are found nearby growing exuberantly on the plain toward Monteagudo along the rivulet called Limón.

Next come the hills called Huacangui, Bartolo, and Cazaderos, the first two found on the right bank and the latter on the left bank of the Acero River, which touches the slopes of the last named; the three have no peculiarity, only that they are tree covered, rather high, and the road through
• [136] them is very bad. Cazaderos Hill abounds in jaguars, and it is the same hill which must be crossed or climbed in order to go from San Juan del Piray to San Pablo de Huacareta; before one climbs this hill near San Juan, there is another small one called Ñañoloma, which attracts the attention of all because it is very narrow, low, and straight; it is a straight line which rises in the middle of the valley and continues without ending to the southeast; the Piray and Parapiti rivers wash the base of Ñañolama.

/7/ Monteagudo has a somewhat irregular plain, but it is not interrupted by hills until three leagues away, that is, at the Parapiti River in Matara, where there is another hill renowned only because it is a road and an extremely bad one. The Parapiti River bathes it at its base, and along the river itself the way is very boldly opened through the hard rock, forming a waterfall there; this same hill must be climbed to leave Ingre Canton, as well as Igüembe, where the passage is also quite rough.

133 From Matara to Ivu there are hills and rises of little im-
173 portance, if one makes an exception of the hills of Itiranti,
648 Saararenta, and Incahuasi, which last separates the province of Acero from that of Cordillera; on Incahuasi there are an infinite number of ruins of fortresses and houses, which, according to what they say and the name Incahuasi, "Inca's House," was an encampment of Quechua Indians, when, at the orders

[221] The most satisfactory and safest season for fishing is from the May cold until the end of July and in certain years up to [251] the middle of August; then all the Indians are fishermen; they fish for themselves and for trading; they open the fish though the middle vertically and dry it in the sun. If nobody goes [438] there to barter, they go off to sell it at 20 centavos apiece, [435] but generally during the fishing season the tribes far from the rivers go to the banks of same, taking maize or parched meal and bringing back abundant fish. /Illustration appears here./

/9 cont./

133 [312] [231] At this point the river disappears completely from the month of June to December or January, forcing the farmers to make great excavations in its bed in order to be able to water their livestock; they have to go down to five meters in certain places. The course of the now dry river is easily seen, because in the season of great floods it leaves on the bank all the trash which it drags along and in its bed all the sand; the waters reappear to form the San Miguel River in the province of Velasco.

133 312 /10/ The benefit that agriculture and cattle raising draws from the Parapiti is indisputable; without it the existence of Parapiti and Isoso cantons would be almost impossible. All the wealth of both areas would disappear, there would be no livestock, sugar plantations, or rice fields as there are now on both banks, which lend themselves marvelously to the opening of canals and irrigating the sugar-cane fields which abound there. Nevertheless, the extraordinary floods of certain years do much damage, making plantations and their equipment disappear almost completely.

• 136 This river contains few fish; there are only bagre and shad and others of little value; the big dorados do not exist and there are only a few small ones in its tributary, the Piray River, but strangely they do not enter the Parapiti; at the confluence they go back. Below the San Francisco Mission the fish disappear, because the water diminishes until it almost all disappears near Mariqui.

241 311 312 In Isoso maize is planted in the month of June in order to harvest the crop before the beginning of the big floods which inundate it all, and during the rainy season they are content to sow frijoles, gourds, melons, and watermelon far from the riverbed, but fruit is not always produced, since the region is rather arid. The waters of this river are quite sweet, and this must be one reason why agriculture is very vigorous on its banks, as any traveler can see.

/152 cont./
earrings with real "diamonds," rings with "sapphires," or other 123
fine things, which she could then show off at the next drinking bout. 439
There are always two villages in these mission stations, 437

more comfortable in the former, and this not only because more 797
fine, old things were to be collected there, but also because the people there were friendlier, more tactful, and more polite in their behavior. The mission children were importunate and impudent.

Near Machareti there is a large basin-shaped valley through 133
which flows a little brook that probably swells to a roaring river after a violent tropical rain and disappears in the wilderness of the Chaco. Quite near the mission it leaves the handsomely dissected [135]
mountains, where small petroleum springs trickle out everywhere in the crevices of the cliffs. Then it flows through a hilly landscape that gradually turns into the vast flat area of the Chaco. The vegetation in these regions is not very luxuriant. The wood- 137
land, when such is present, is sparse, low, shrubby, and monoto- 241
nous. The fields seem to produce abundant harvests, the droughts seldom too long. These regions are often devastated by huge 731
swarms of locusts. I have seen these destructive animals cover the 136
woodlands like large, reddish-brown clouds.

From Machareti we went by way of Itatiqui, a very interesting 114
Chiriguano village in an arid region, to the Rio Parapiti.

The latter comes from Pomabamba and Sauzes, from the 133
/153/ mountains of the Quichua /Quechua/ Indians. After it has left these, in the rainy season, it is a roaring stream overflowing its banks. In the dry season it carries little water. The Rio Parapiti also ends in the Chaco. During the rainy season it is *lost in the swamps, in the dry season it disappears in the fine sand.* If the Rio Parapiti parades on the maps, as the southernmost tributary of the Amazon River, this is only empty boasting on its part. The woodlands along the Rio Parapiti consist mostly of 137
bushes and low, fine-leaved trees, caraguata, and cacti.

/155 cont./ C
Piray and finally unites with the Rio Mamoré. A few Chiriguano 133
live along this river, and savage Tsirakua and Siriono also [101]
rove about in the forests along it. C

Between the Rio Grande and the Rio Parapiti there is a 133
region with an extreme scarcity of water and largely covered 137
with completely impenetrable underbrush and low scrub forest 312
full of caraguata and cacti. This monotonous, dismal vegetation is interrupted here and there by hills and grassy plains. C

Besides the savage Tsirakua Indians who make these thickets 136
unsafe, one finds another curiosity here, namely the guanaco C
(Auchenia). It is altogether strange to find an animal like the [132]
guanaco, which one thinks of only in connection with the cold plateaus of the Andes or the /156/ pampas of Patagonia, often afflicted with frost, in this bush which is frequently scorched by droughts. It would be interesting to be able to determine whether this guanaco of the tropical forest is really the same as the one known from the colder regions. Intelligent whites with whom I have discussed this and who have seen both regard them, however, as the same species. Ce

Having returned to the Rio Parapiti, I looked up Batirayu, 115
with whom I had already become intimately acquainted in 1908 and who also speaks excellent Spanish.

With no other Indians with whom I became acquainted did I become as close as with Batirayu. He understood that I was collecting the old mementos out of an interest in his tribe. Batirayu did his best to explain to me the religious conceptions of his tribe. In the evening we used to sit in his room with a Ce
cigarette, and he told about olden times, sorcerers, chiefs, *and spirits. Occasionally an old chief, Böyra, also came, and* [102]
from him I heard many charming Chané legends. We would sit until far into the night and chat by a flickering light that I had with me in order to take notes. Ce

One would be very much mistaken if he were to believe that 115
the conversations with these men were merely an interesting 123
study. I felt comfortable with these fine, tactful, yes, why not, cultured human beings. It was genuinely refreshing after coming
from the often vulgar, empty whites

/160 cont./ Ee 13

The region settled by the Chiriguano and Chané Indians is really very extensive. It is varied in nature, from luxuriant virgin forests to extremely arid valleys and plains poor in vegetation. It is in part very mountainous, but the Chiriguano and Chané are not mountain people. They stay down in the valleys and do not climb up to the peaks and plateaus, like the Quichua Indians. Ee

Animal life in these regions is poor, in fact, very poor. 136 ●
A hunting people could never live there. Now and then a roebuck, a wild pig, a few ostriches, that is all one sees in the way of big game. Bird life, too, is very poor. /161/ Ee
The number of lakes is very small, and they are no larger than what we would call pools in Europe. On the Rio Parapiti [133]
one sees quite a large number of white egrets (1), famous for

1. Ardea.

Ee
their valuable feathers. With regard to wood fowl, only the [262]
chicken called "pavas" (2) contributes to the diet. Occasionally

2. Penelope.

one sees a large-billed "toucan" (3). Sleek pigeons, fattened

3. Rhamphastus.

on maize, often live in mames in the fields of the Indians. Ee
In the Rio Pilcomayo there is a great abundance of fish, in the little rivers the fish are small and poor. The Indians who [243]
live in these regions have to be farmers, and they are maize [242]
farmers to the highest degree. For them maize is food, [273]
drink, pleasure, everything!

I have no adventures to report from among these Indians. ●●●
Everyone may travel unharmed among them. The greatest sorrow of the ethnographer is that he is unable to collect all the interesting and old things that he sees there. One cannot take everything home.

C /176 cont./

C
Ce I have slept in these huts many a night. They are, as a
342 rule, free of vermin, which cannot be said of the dwellings
122 of all other Indians and of the houses of the whites. The sleep-
136 ing place either consists of a bed made of a species of bamboo
352 cane, or one lies /Plate 16 appears here/ /177/ on the ground
513 on a reed mat or a skin. One also sees hammocks in the huts.

/273/

539 Accompanied by Dyori, Tatutunpa set out on his way. Along the way he killed a tapir. Dyori (1) divided it into four

[171]

1. Dyori is always described as the insatiable one. He corresponds to Móconomóco in the legends of the Mojo.

parts and devoured it. He even licked the blood from the ground.

Tatutunpa found his mother blind in the woods. She begged him to kill the jaguars who were keeping her captive. "They come to the watering place in order to drink," she said.

Tatutunpa made himself a little shelter in which he hid. Dyori hid behind him. First came "Embaracaya" (2) with her booty.

2. A large wildcat.

With one blow Tatutunpa shattered her head and threw her and her booty to Dyori, who devoured everything. In the same way he killed "Yahuapinta" (3) and the other felines. He threw them

•[136]

3. Puma (Felix concolor).

to Dyori, who devoured them all. Finally there came Yahuête, who had two heads. He asked Inómu for water. Yahuête was carrying a tapir that he had killed. Inómu directed him to the watering place.

"No, give me water here, there is someone hiding at the spring," said Yahuête.

"No, there is no one there, and how should I, I who am blind, be able to fetch water, I would fall," said Inómu.

Yahuête went to the drinking place. When he reached there, Tatutunpa hurled his club, in order to kill him, but struck only the dried head, and Yahuête leaped away. Tatutunpa followed him. When Yahuête saw that he was being pursued, he hid under the "tiru" (women's attire mentioned on p. 52) of the moon.

"Where is Yahuête?" asked Tatutunpa.

"I do not know," answered the woman (that is, the moon). That was the first lie.

I.A. 509 " " " " 14 cm.

C Ce 286 352 227 136

From the large size of the mesh of nets I.A. 260, 766, and 794, it follows that they are hammocks. Because in Chiriguano and Chané territory there are generally no fish except small ones, nets for fishing must have considerably smaller meshes.

C Ce 415 286 482 [283]

Of the Chiriguano nets for carrying loads, two are made of wool and one of these has a band like most such nets from the Isosó. The rest of these nets from the Chiriguano and the Isosó are made of caraguata thread. Some of them have a rather small mesh, but among those of the Isosó those with big mesh are the rule.

/430/

Chapter IX

Basketry and Its Techniques

1. General Considerations

Basketry is far from being as abundantly represented among the Chiriguano and the Chané as among the Indian tribes of the Amazon basin or the Guianas. The secondary role it plays in their industry is due to the nature of the soil where they live and the climate they enjoy. Palm trees with pinnate leaves are lacking, to my knowledge at least, over the whole extent of their territory: as for the ones whose leaves open like fans, if they are numerous in certain places, their occurrence is far from being uniform. The palms which the Chiriguano Indians call karandaí (Copernicia australis) form veritable groves here and there, whereas over vast regions they are lacking or appear only sparsely. I saw a considerable number of them between San Luis and the Saladito River, and I have crossed some large palm groves between Tacuiba and Villamontes, on the Pilcomayo, and south of the Parapití River, going from Cuevo to Pipi. I noted, moreover, that the distribution of the karandaí coincided with that of a certain type of basketry (twilled work /named in English/), for which the Indians use these leaves.

Fig. 97. Back basket used by the Guarayú Indians for transporting heavy loads (from Nordenskiöld).

Nordenskiöld (10, p. 169) recounts an anecdote which illustrates well the influence the environment exerts on this industry. At the time of one of his trips into the Chaco, the scholar was accompanied by several Guarayú Indians, who followed him as far as Chiriguano country. The Guarayú customarily load their baggage and the products of their fields into back baskets of a special type (see Fig. 97) which have a wide distribution in tropical America, from the Guianas to Paraguay (Nordenskiöld 11, p. 171 and MAP 21).

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

The migrations, wars, and the religious conversion of the *Chiriguano* have been the subjects of many historical monographs. The most important of these are by Corrado (1884), Serrano y Sanz (1898), Domínguez (1918), Gamba (1929 a, and b), Métraux (1930 b), Coni (1925), Moreno (1929), and Finot (1939). The Jesuit missionary work among the *Chiriguano* has been described by Lozano (1941) and Muriel (1918).

CULTURE

SUBSISTENCE ACTIVITIES

As today *Chiriguano* and *Chané* share in the same culture, the following data may apply to both tribes.

Farming.—The *Chané*, conquered by the *Chiriguano*, were proficient farmers who, though practicing a tropical type of agriculture, were probably acquainted with many of the methods of cultivation of the Andean area. The *Chiriguano* adopted their traditions. The new habitat of the *Chiriguano* did not offer the same resources for hunting and fishing as had their homeland. Therefore, these Indians depend on farming to a larger extent than any other *Tupi-Guarani tribe*. The basis of their livelihood is maize, of which they have 11 varieties, all related to those of Paraguay. Then follow in order of importance: Pumpkins, beans (11 varieties), sweet potatoes, sweet manioc, peanuts, and some Barbary figs (*Opuntia* sp). Sweet potatoes were grown on a large scale by the *Chané* of the Parapeti River.

These Indians also raise cotton, tobacco, urucú, and, in the Parapeti region, reeds for arrow shafts (*Arundo donax*). Plants of the Old World adopted by the *Chiriguano* include melons, watermelons, oranges, sugarcane, and sorghum.

Chiriguano men clear the fields and surround them with a tall fence as a protection against the inroads of wild or domesticated animals, a task which is considered to be particularly strenuous. They also till the soil, but at harvest time they are assisted by the women and children. The latter, armed with slings, drive away the parakeets and other birds which prey on the crops. Nordenskiöld (1912, p. 183) observed that among the *Chané* of the Itiyuro region, large maize fields were tended by men while pumpkins and beans were raised by the women.

Collecting wild food.—When their crops fail, the *Chiriguano* subsist on the same species of pods and fruits as those collected by the Chaco Indians: Algarrobo, tunca, mistol, caraguatá, and other plant foods.

Hunting.—Hunting is a very secondary economic activity, at least in modern times. Peccaries, which are the main game animal, are hunted with specially trained dogs and killed with bows and arrows or with clubs. Rheas, which are abundant in the Chaco plains, are caught with bolas. Pigeons are captured with clap nets. Special arrows with two points are used for hunting yacu birds (*Penelope* sp.).

/14 cont./

311 The closer the traveler gets to the Gran Chaco, the less
312 water and the less fertility he finds; the very fields of Yvu
241 are patent proof, for crops are rarely abundant there. When the rains are torrential in other sections, they are sparse in Yvu; the farther to the west one travels from Aguaragüe, the more fertile is the land, because the hills and hillocks are more frequent and higher, water more abundant, and consequently the land more moist, which is necessary for agricultural production.

The fields are suitable for raising cows and horses, for the multiplication of sheep and pigs; the year when it fails to rain, however, there is lack of food for the livestock, as well as lack of water, the suffering is great, and numbers die near the waters which are found at some distance from the spots where there is feed, such as the slopes of the hills and the tops of the hillocks, abounding in tree leaves.

• 137 The countryside is clothed with grasses in the summer, but the region begins to turn beautiful in the spring and even earlier. The vigorous woods, dry and leafless during the cold months, begin to dress in verdant foliage at the beginning of the month of September, and in a few days nature is rejuvenated. Then it is very lovely to contemplate from some slight rise a broad pampa where there are carob trees, groves of catalpas or lapachos, the first green, the second red, and the third yellow and purple.

241 The territory is productive only in the rainy season, be-
182 cause the Chiriguano in general will not take the trouble to put
[132] in a good irrigation ditch when he can; he waits for it all from
[433] the high heavens. Miracles could have been worked on the banks of the rivers in times past; today it is difficult because they are very few and, like their grandparents, are satisfied with maize, a little sugar cane, and other delicacies, like sweet potatoes or batatas, mandioca, and peanuts.

241 Large-scale planting begins at the end of November or the
[221] beginning of December, after the country has been watered by two or three abundant rains. The maize grows very high and, when there is no lack of water, produces two or three ears on each stalk. The frijoles produce three crops. The sugar cane

/15 cont./

433 241 sweet potatoes; cotton grows everywhere, tomatoes and garlic mature the year round, and in the gardens lettuce, cabbage, cauliflower, and peppers create the beauty of a spot, without taking into account the gastronomic advantages. Even the peach trees would yield fine fruits, but they suffer much from the black butterflies, which damage them before they ripen.

Without work the land will produce only briars and brambles, and /16/ as long as there are only Chiriguano and [157] [181] [185] cattle ranches here, progress will be slight and the population sparse, because the Indian has no ambition, and life is relatively inexpensive; the whites prosper by taking good care of their livestock, and no greater fertility can be obtained from the land because the holdings of a few families are very extensive and do not facilitate the residence of numerous renters, who do not always give good results nor do all come or ask to rent for farming alone. All of them want to get rich easily and quickly, and the best way is to raise stock, the result of which is that great areas of briars and brambles exist.

Flora

13 In the course of this hasty description I have noted that in Chiriguano country atmospheric changes are very sudden, but it has been noted that the region is quite fertile when it is watered by the rains or by irrigation ditches, because small rivers are plentiful, particularly in the mountainous region, and an occasional river of some size bathes the adjacent territories with its abundant waters.

There are many hills, pampas, and valleys, and for this reason every kind of climate may be found in this territory. [137] There are in fact oppressive heat, intense cold, and a temperate climate, thus making it possible to find land for every product from the lowly gourd to the savory chirimoya, from the ubiquitous maize to wheat, rice, and barley, from the mulberry /mora/, which grows spontaneously, to the rich grape, whose bunches reach weights of three and four libras.

824 /16 cont./
139
[114]

I am going to make a brief list of some trees and plants which I know, without pretending to be a botanist, a subject I have not studied. I shall only say that I have learned it through experience and careful reading; when describing certain plants, I shall also make note of the use made of the bark, root, leaves, and branches of some.

ACACIA BALSAMICA. -- This is the quina-quina, under which name it is known here in Chiriguano country, a tall, straight tree, whose wood is ideal for building because the wood borer does not damage it; it is much used here in the construction of upper roofs, especially for the braches or trusses on which the roof frame is to rest. It is plentiful in Cordillera Province and even in Acero Province.

/17/ ACACIA SAPONARIA. -- This tree is large and its wood light, perhaps even lighter than cedar, but it is of less value; it is whitish and much used for making doors and windows, but the main use to which said wood is put is in saddleries to make pads for saddles. The seeds are similar to monkey ears and are good for washing clothes and to keep the skin of the face free of blemishes; here it is known by the name "timboy."

[342]
[492]
[296]
[515]

ACACIA AMARILLA /A. moniliformi/. -- It is a medium-sized tree of rather lightweight hardwood, for which reason drawers or wash basins and yokes for oxen are made with it. It is no good for making fire, because it smells when it burns from which it gets the Chiriguano name "Tatane," fire that smells; the wood is yellow.

[372]

ACACIA ASTRINGENTE. -- There are many groves of trees of this class here and there; it is the most abundant tree, the wood is good for small joists because the wood borer does not eat it; the bark contains much tannin, and it is the wood most used for tanning hides by both Indians and whites; the latter call it sebil and the former "Curupau."

[342]
[281]

245
137
324

ACHIOTE. BIXA ORELLANA. -- This is cultivated in fields and gardens, grows to a height of two and a half meters, its leaves are dark green; it produces abundant fruit in a sort of pod covered with bristles and filled inside with fiery red seeds, which are what makes the little tree highly valued. They serve as food coloring, and the Chiriguano paint their faces

[302]
[303]
[439]

/17 cont./

245 137 824 [302] [303] [439] and feet with them, as will be seen; for this last purpose it is prepared beforehand, many pods being boiled in an olla, and pastes of every size are made from the decoction, depending on the value that they wish them to have; it is traded by Chiriguanos and whites.

137 824 The Bixa orellana, or "Urucu," as the Indians call it, is a plant of high value for the Chiriguano; he will travel far to obtain a small amount in the towns or places where it is prepared.

ALGARROBO. -- The place where this extraordinarily large tree abounds is in the pampas; thus in the plain of "Curuyuqui" of Yvu Mbaion, Isoso, Parapiti, and the Gran Chaco it is found forming forests. It is very bulky and has [342] [415] long branches which on some touch the ground; its trunk is thick and not always erect, the wood is excellent, similar to oak in spite of being dark, and it is much used for making tuns, door and window casings, and even for barrels. In [262] [273] Chiriguano this tree is called /18/ "Ivopei," and the "Ivope" pod is long, compressed, and yellow; when it is ripe, it is sweet and much sought after by livestock and by the Chiriguano; it is their food and drink in times of scarcity as well as other times, and the mead that they make is extremely intoxicating. On the bank of the Pilcomayo even the whites eat this pod; the Toba, Choroti, Mataco, and others hold their orgies when the algarrobo ripens.

ALGARROBO CHICO. -- This is a smaller tree than the previous one, even its fruit is smaller, speckled in color, and sweeter than the true algarrobo, but not as abundant as the first. As the pods are small and the seeds within abundant, it [262] is not highly thought of among the Chiriguano; they only eat it out of necessity or as a tidbit; the wood is not valued very highly because undoubtedly there are others that are better. In Chiriguano it is called "Ivope rai."

ALGARROBO AGRIO. -- This is also small, and it is called [262] "sour" because the flavor of the pods really is sour. In times of scarcity it is also food for the Chiriguano; the pods are small, and the tree has its congenial sites. The Chiriguano Indians call it "Ivopetayi."

/18 cont./

•137 824 ALGARROBO NEGRO. -- Among the Indians this is called "Ivopene," and the whites call it tusca; it multiplies and grows very fast. Sometimes 20 or 30 newly sprouted plants can be counted around a single cake of cow dung, which indicates that the cattle eat it in abundance, and where it does not already exist they sow it with their bowels. [262] It grows to a height of some three meters and is very thorny, which makes it difficult to travel through places where it is abundant; when there is no other food it is one of the Chiriguano's resources.

[322] ALGAROBILLA. -- The wood of this plant, which the Chiriguano call "Igüirayepiro," is black and very good for cabinetmakers; it is a species of ebony and is strong. Implements of war and those for fiestas of the tribes are made of this wood; its trunk is twisted, and it rarely has a single trunk; the flowers are yellow and the berries much sought after, by goats, but it makes them abort.

ALGODONERO /cottonwood/. -- This is a leafy tree with many branches; it grows to a height of two meters, has yellow flowers and a white boll when it is ripe, which is then picked, dried in the sun, the material pulled away from the seeds and cleaned. The "mandiyu" cotton is very useful; hammocks, ponchos, saddlebags, and sacks are made with it; it would even be easy to manufacture macana, but this is not done because what comes from outside is very cheap and /19/ [157] showier, even though it is not as strong as the other. Its leaves used as a poultice are anticancerous, and its seeds in the form of a pomade work against herpes and skin eruptions; oil for lighting can be extracted from the seed.

ANONA. -- The annona is a bush which grows to barely one meter; it has congenial places, the pampas, which have soil mixed with sand. In the said pampas it thrives in abundance, but it is even found in other places. The ripe fruit is red and like the pineapple in shape, but the pulp and seeds are like the chirimoya, as is the flavor of the pulp. Before it ripens, even the skin is very similar to that of the chirimoya. The Chiriguano call it "Aratícu."

ASPIDOSPERMO BLANCO. -- This tree is of great size and it is abundant almost everywhere; the wood is white and good

/19 cont./

137 824 [157] in dry places; when dampness penetrates it, it is destroyed in a few years, as experience has shown. The bark that is found under the first layer is split, washed in tepid water, and left to steep overnight; it cures intermittent fever. The Argentinians call it cacha, the whites quebracho, and the Chiriguano "Igüiraro."

AZUFAIFO /jujube tree/. -- This is abundant hereabouts [162] and is a tree of medium size. Its wood is not valued very highly, but the fruit, the size of a grape seed and of a dark coffee color, is a great resource in times of scarcity for the poor Chiriguano. It ripens in January and February and is liked even by cattle and by sheep and pigs. The whites call it mistol and the Chiriguano "Yuá."

245 BANANA TREE. -- Cultivated in orchards and well fenced-in fields, it forms a grove, and each plant yields or produces a cluster, very large on some of them. When the ripe cluster is removed, the plant that produced it must be cut in order that the others may produce their own. There are several [162] varieties, large and small, the latter very sweet and eaten as fruit, and the former only when boiled and roasted; the whites call them plátano, and the Chiriguano "Pacoba."

137 824 BIGONIA ACUOSA. -- This is a tiny little bush one vara in height, which under the ground has a large root like a watermelon and even larger; it contains much pulp which, [171] when squeezed, yields potable water and is used for it in times of scarcity. The Chiriguano call it "Sipoi."

[142] CATALPA. -- This is a large tree and fairly strong. Its wood is used in the construction of houses. The color of the /20/ wood is dark, but when it is newly cut it is somewhat [115] green. Its flowers are purple, and the Chiriguano chew them to whiten their teeth; they are bitter and because of this the tree is called "Tayi," or bitter, in Chiriguano, the whites call it lapacho.

CEIBA. -- A large tree with deformed trunk, and furnished with sharp points, broad leaves, and large, white flowers which produce a material similar to cotton without fibers, for which reason it is smoother and shinier; it is used for mattresses [122] and pillows and candle wicks. The wood is spongy and not at [115] all hard; from it are made troughs to hold water from year to year and in this way they are not soon damaged. Its ashes

/20 cont./ ITS ashes
[137] are good for the manufacture of soap, the bark is an emetic.
[824] The whites call it toborochi and the Chiriguano "Samuú."
[388] There are several varieties and all of them are utilized to
[757] some degree or other.

[322] CEIBO. -- This tree is smaller than the former, but its
[415] wood is much superior, very fibrous, and rather light in weight, being used to make troughs which are very durable since they neither split nor are eaten by wood borers. It is very pretty when
[262] it blooms; the flowers are fiery red and good for salads. The Chiriguano call it "Suinandi."

DRAGO /dragon tree/. -- A tall tree, straight and quite thick; the wood is strong and useful. If an incision is made
[757] in the tree, a very red resin comes out; its bark is the best for making the teeth hard and for curing scurvy. The gum called "dragon's blood" is extracted from this tree. The whites call it tipa and the Chiriguano "Güirapitiyu guasu."

ENEA /cattail/. -- An aquatic plant which abounds in certain ponds and pools formed by the water of rivers which flow away from the main stream; the Indians use it for roofing their houses, muleteers for packsaddles, and others for mats in the dwellings, on which they also have their bedding for sleeping. This is the totora or matara of the whites and the "Caipempe" of the Chiriguano.

[262] ESTORAQUE /storax/. -- This is a very large tree of the forest; it has whitish flowers and yellow fruit the size of a fig, which is edible and a favorite of parrots and monkeys; the Chiriguano eat it as a fruit and call it "Aguai."

GARGATEA or CARICA MAMAYA. -- This tree is not very abundant nor is it found in every section. It is of normal size, with a straight trunk and smooth bark softer than the fig tree; the wood is soft and is of no use at all, being similar to that
[262] of the ceiba, or toborochi. Its leaves are like those of the fig
[252] tree, and the fruit is of the /21/ same size and form, but yellow; it is edible and good when boiled or roasted. If eaten raw, it hurts the mouth. In Chiriguano it is called "Caincantina."

/21 cont./

137 GUAYABO /guava/. -- This fruit-bearing tree is found
824 wild and cultivated; it is of medium size, and the fruit, when
[245] ripe, is yellow on the outside and purple on the inside, and its bittersweet flavor is very pleasant and laxative. The green fruit and the roots are astringent; the Chiriguano know it by the same name. The wood has no use at all, and even if it
[262] did, the Indians would not use it because it produces edible fruit. They regret it when any of these trees and others, like the algarrobo, are destroyed.

GÜEMBE. -- This plant thrives on the trunks of high trees, where it puts its root, and others which penetrate the ground
[492] hang down from there. The roots and lianas are dark in color; very strong and durable halters are made from its bark; it is not found everywhere. One encounters it from the left bank of the Parapiti River; its fruit is similar to that of maize, for which reason it is called maize of the air, and it is edible.

HIGUERA AMERICANA /Amerigan fig/. -- This is the
[262] guapoy of the Chiriguano and the bibosi of the populace; although the fruit is rather sour, it is edible. Bats like it, and it
[757] is annoying to have this tree near the dwellings; it has a milky juice like the common fig tree, which, applied to wounds, heals them. In addition to the above fig tree, there is the
[245] common one which flourishes with very little care, in the towns,
[439] especially the Mission ones, it is widely cultivated by the
[431] natives and its fruit is used by them for gifts and trade with the whites.

244 MANDIOCA. -- This plant is called "Mandio" or "Mandiporopi" by the Chiriguano Indians. A little book written by a Jesuit missionary of the old Paraguay missions relates that this plant was left to those Indians by Saint Thomas the Apostle who, according to their tradition, came here to preach the doctrine of the Redeemer. Mandioca is
[252] an excellent food and very digestible; it is eaten boiled,
[262] roasted, and fried in lard. It is a plant cultivated by whites and by Indians.

/21 cont./

•137 824 MARA or CAOBA /mahogany/. -- This tree is found in all sections. It is a strong wood, but the white part at the sides is subject to decay. It is rather heavy and hard and is only used for door and window casings and even for tables. The leaves are permanent, but not too good for shade. If the leaves are touched with some force in order to pick them, they cause a skin eruption which disappears only when treated with bees' honey; I cured myself this way twice.

[342] [352] [757]

137 /22/ MELOCOTÓN /peach tree/. -- This tree, native to Persia, is quite productive in this region, but its fruit, severely attacked by the black butterfly, does not reach maturity because it always has worms. The apple tree grows in high places and where the atmosphere is not so hot, but both of these are orchard trees, not native ones, having been imported by the whites, who cultivate them, which can also be said of the quince tree.

137 824 MOLLE. -- This tree is not found in the central part of the region and thus is not native here, being obtained only by cultivation. The whites and the Missionaries have introduced it into the towns with good results. It is found in abundance in the district under the jurisdiction of Padilla; it has permanent leaves, which are medicinal, as is the resin which comes from the trunk; a cooling beverage, pleasant and similar to wine, except that its odor is somewhat disagreeable, is made from the seeds. The eucalyptus is another tree which thrives regularly here, but it has also been imported; its leaves, also permanent, are very good medicine for the endemic fevers; its trunk is an excellent wood. Neither tree has a name in Chiriguano, from which it can be deduced that they have been imported, like the grape vine, the common fig tree, the peach, quince, etc.

[757] [2073] [757]

MORA OR MORERA /mulberry/. -- This tree is found wild from the left bank of the Parapiti River in Cordillera Province. It rises to a height of some 15 meters, is bulky with a very leafy top, and the fruit is smaller than that of the cultivated mulberry; the wood is solid and compact like that of the *roro* and has even better qualities; it is used for machines for milling sugar cane, plantations of which are common from the banks of the Parapiti River, where sugar of the highest quality

/22 cont./

•137 824 is manufactured. On the slopes of the hills is also found the blackberry /zarzamora/, whose fruit is so pleasant to the palate, but whose thorn, which is like a cat's claw, is quite dangerous and barbed. The mulberry in Chiriguano is called "Tatayigua."

245 NARANJO /orange/. -- Neither the orange nor the lemon are native to the Chiriguano region, but they flourish greatly and grow to some height. Where it is easy to open irrigation ditches and possible to irrigate orange and lemon trees, they produce large, juicy fruit, the former being very sweet and the sourness of the latter being mild. The citron tree flourishes and is a plant imported here; its fruits are as big as gourds. The Chiriguano cultivate the orange tree here and there, but the whites cultivate it on a large scale; I know of some /23/ rather large orange groves, and they exist in nearly all the missions.

139 824 NOGAL. -- This tree of extraordinary height is only found wild; the leaves are very small and somewhat like those of the true nogal; the fruit is edible, but its shell is hard to crack. [258] The flavor and characteristics are the same as those of walnuts, so that oil, which is used instead of that from the olive, can be extracted from them. The wood is rather dark and good [322] for carpentry and cabinetwork, but it is inferior to that of the true nogal, which is found in the cultivated state where there [386] is sufficient moisture; a dark coffee-colored dye is prepared from the leaves, the bark of the trunk, or the roots, for dyeing wool, for staining other woods, and for printing ink.

NOPAL. -- This is the fruit-bearing plant which is most abundant in the region and which is found everywhere without any cultivation, for which reason it is most highly regarded by the Chiriguano, who is naturally lazy. But since it is sought [245] by the cattle, it is beginning to disappear or, more exactly, it is not found very much in the woods and clearings, but the Indian still cultivates it because it flourishes easily without need of irrigation and multiplies without the need of planting other shoots. It is convenient for the laziness of the Indian; the yellow flowers come out around each spathe and the fruit matures there as well; it is full of small seeds and sweet pulp, pleasant and refreshing. Some trees are covered with long

/23 cont./ some trees are covered with long
137 sharp points and others are not, only having an occasional im-
824 perceptible sharp point; the fruit of both is pleasant and serves
[139] for gifts and trade for the Indian, who sells it to the whites,
[431] the ones who, rushing to get rich more quickly and easily, are
[348] little concerned about the nopal and the fig tree. In Chiriguano it is called "Saini."

PALM or PALMER. -- The palm tree has congenial places, where immense forests are formed and sometimes grow all around a lake like a great garland; it is a very tall and smooth tree without a single branch. Its leaves are in the form of a
[435] fan and are used to make hats and for sieves, which are sold
[342] for 30 or 40 centavos apiece. The wood is good for joists in houses, and it is also split into shingles for roofs and is quite durable, if the precaution is taken of cutting them after the full moon. In Chiriguano it is called "Carandai," and the place which they occupy, "Carandaiti," palm grove.

PALMA CHRISTI. -- A not very durable plant, it grows to a height of four meters, has a soft, hollow trunk, large leaves, /24/ and flowers in the form of a bunch of grapes. The seeds are found inside little burrs, like chestnuts; said burrs in some plants open by themselves in the warmth of the sun, while others must be opened or carefully broken with a little hammer or a stone. The name indicates that it is a beautiful plant, but this beauty is in the broad, abundant perennial leaves. There are several types with reference to
[159] size and quality of seeds; I know five kinds. Castor oil is
[302] extracted from this plant or from its seeds for use as medicine; we use it in the missions to fuel the lamp of the Blessed Sacrament, and the Chiriguanos mix it with "Achiote" seeds and put the resulting cosmetic on their faces and on their calves down to the feet. In Chiriguano the plant is called "Cenirio," and the oil, "Yandi." Even the leaves of the
[159] Palma Christi are medicinal, some being hot and others cool; thus when headache is a result of overexposure to the sun, the leaves of the white spurge are applied; if, on the other hand, it is the result of high humidity, the leaves of the red spurge are applied. The seeds of the dark purple spurge are very small, but contain more oil than others.

[illegible] tree. -Analysis[]

/24 cont./

245 PAPAYO. -- This tree is neither native like the palma Christi, nor is it found wild like the latter. It is grown in orchards or in well-fenced fields, grows very fast, and produces fruit one year after being planted. Its trunk is straight, soft, and hollow; some have two or three branches and rise up to four meters high. The fruit is refreshing, yellow, with a smooth skin, of the size and shape of a small melon, even the flavor being somewhat similar, but it is more digestible. Many fruits are bunched around the trunk and are also found here and there at each leaf, but always attached to the trunk. The plants which produce the fruit are the good ones, and they call them "females." There are others which they call "males," but their fruits are useless and are not attached to the trunk, but rather hang from it like streamers. It is useless to pick them. To have a good papayo tree they assert that, in transplanting one, it is necessary to take the precaution of always putting or burying two plants in each hole, one of which will always be a female, and the one which turns out to be male will be pulled out. I do not know if this is true, but I did it this way in January of this year. The fruit contains many seeds which, [257] when ground and drunk in an emulsion, are good for getting rid of worms. The fruit and the tree have a resinous milk. [252] Therefore, in order for the fruit to be good and digestible, it is better to cut off the ends and make about five or six vertical cuts so that this resin may come out; by the next day /illustration appears here/ /25/ it is already very pleasant. It is nevertheless best to take the precaution of letting them begin to ripen on the plant itself; in this condition, uncut, they will last up to six days without going bad; then they can easily be transported great distances.

137 PASSION FLOWER. -- This is a climber which is found 824 on fences, clothing them in the rainy season with abundant [252] foliage, as does the "supua," whose fruit is edible and good [262] roasted or boiled, as is the leaf. The fruit of the passion flower is of the size of an apple and just as smooth, the skin is thin and the inside is found to be covered with a white, stringy membrane. When this is broken, the seeds of the fruit come

[Text continues on p. 43]

/25 cont./

•137 824 forth bittersweet and very good. These are ash-colored and pearly and very highly regarded by Chiriguano and whites. The blossom of the passion flower is purple, forming a garland like a crown of thorns; it has its calyx, five petals and three pistils, for which reason it is called passion flower, and it is certainly worthy of admiration. The Indians call it "Murucuya."

PIÑON. -- A euphorbiaceous plant, this little tree exists [177] in a cultivated state and was introduced into this Chiriguano region by the white Christians. It grows in orchards and elsewhere, and its maximum height is three meters. Its small [157] trunk is slender and top heavy, and its fruit consists of black seeds which are not edible but which, when ground and diluted in water, make a powerful purgative and therefore must be used with great care, because they can cause death.

137 SAUCE /willow/. -- It grows and develops on the banks and in the bed of torrents, as well as on the shores of streams, which shows that it seeks damp places, but from these places the force of a flood often uproots it. The common willow has [342] no special qualities; only its branches are useful in the building of houses because they are flexible, fibrous, and not heavy; little use is made of the trunk. It is a tall, large tree with very tiny leaves. In addition to the common willow there is also the weeping willow, whose branches touch the ground; it is neither native nor found wild; some whites plant it to beautify their interior patios. In Chiriguano the common willow is called "Ñañirapuco."

SAÚCO /elder/. -- It is not found everywhere, only being found along streams with little water which are in the wood. It grows to four meters in height, its trunk is slender and soft, its branches have a pith which is easily extracted, and its white flowers in the shape of a parasol are sudorific. The whites do a good deal of searching for this flower /26/ for their illnesses. Even the leaves are medicinal; when drunk in a decoction they are a good purge. What a pity that it is found in such limited areas!

/26 cont./

•137 824 SOTO. -- This gigantic tree is found everywhere from the province of Tomina, but there are places where it is more abundant. In the spring, when the budding begins, its leaves are red, and later they turn green. In the autumn its fruit, which the parrots like, are red and are in bunches like cherries. Seen from a distance by a European, he thinks they are cherries. The wood of the uxo is strong and does not rot; in dampness or in water it is better than iron, since it does not deteriorate. [342] It is very widely used in the construction of houses, especially when they are of frame construction. A great deal of tannin, which the Europeans use in tanneries, is extracted from the uxo. It is called palo cuchi by the whites here and "Urundei" by the Chiriguano.

249 TOBACCO. -- An annual plant which flourishes everywhere, but only the whites cultivate it on a large scale, especially in Saipirangui and Chiquiacá, whose products have some fame. Even an occasional Indian cultivates it for his own use and to give to his friends. There is another similar plant, and, when he lacks real tobacco, the Indian deceives himself with its leaves. The true tobacco is called "pooni" in Chiriguano, and the other "huacapooni," which, literally explained, means "cow tobacco." 296 In Bolivia there is considerable consumption of tobacco wrapped in paper or maize husks; rarely does one see cigars of pure tobacco, like the Havanas and others; the Chiriguano smokes a lot and acquires the habit at a tender age. [397] Children of four years of age have already begun to smoke; [542] women also smoke.

137 824 TACUARA. -- In the past when there were no cattle, the tacuara, or hollow cane, was very abundant; vestiges still remain of some immense canebrakes, but the plant has been reduced almost to the cultivated one, with the result that what was previously found in the forest at the disposal of the first occupant is found today in the possession of private parties, and anyone who is planning to build a dwelling must pay for hollow cane at the rate of 50 centavos per hundred, and the worst of it is that it is not found everywhere. This lack is made up for by small reds from trees, but these are neither as light nor always [435]

/36 cont./

139 824 as straight as cane. Beyond Santa Cruz there are still groves; in addition there are groves of another cane called "Bambú," which is the best known, and in Chiriguano it is called "Tacuarembo." It rises to a height of about 15 meters and is used for making /37/ ladders and scaffolding in construction because it is light and strong. The shoots are tender and contain a sugary substance highly regarded by the Indians: it is not sought much today, because there are abundant plantings of sugar cane, which is of great utility for the production of sugar and alcohol. This last thrives with great ease and little work. Planting is done in two ways, making furrows and burying it or planting cuttings. The former is the better method where the freshets of the rivers do not penetrate. On the slopes and tops of hills which contain water there is another sort of slender cane, very strong and heavy, which is not hollow like the other classes and is called caña brava by the whites, and "Tacuarembo" by the Chiriguano. They use it for weavers' reeds and for sleeping cots.

139 824

TAMARIND. -- This beautiful and useful tree is not native, but it thrives with enough care and grows to a respectable height; the fruit that it produces is abundant, consisting of abundant pods more or less the size of chich-pea pods; the pulp is blackish and pleasant to the taste, but it is bad for the teeth. It is astringent and is administered as medicine for intestinal inflammations, especially to children. It is also a good tonic drink on excessively hot days; it is prepared with sugar, water, and a little of its pulp. The tree is rather sensitive to cold, and the flowers wilt easily with the south wind. For this reason the whites plant it in their patios, which are surrounded by the living quarters.

TAGHOUE. -- The name of this tree in Chiriguano. The tatagui is found in some regions, but not in others. It is of the cactus variety, rises up to six meters. Its branchage is abundant and close, which gives a fine shade against the blazing rays of the sun. Its branches or leaves are striated and armed with spines; the fruit is tiny, but sweet and otherwise pleasant, and much liked by foxes, who only get it when it falls from the tree. The ñiala or opuntia is smaller than the tatagui. Its leaves have the same form, the color is ash-gray and they are less abundant, or, more properly, few. The fruit is a smooth berry

/77 cont./

which is purple when mature and opens into three sections when ripe. It has an insipid sweetness, but one which both whites and Chiriguano like. The color is a bright purple. It is abundant, and in certain years of scarcity it is a resource for human life in the months of February and March. In Chiriguano it is called "Nerogüino." The carapari is another cactus, taller than the preceding ones, which also has its congenial land. /78/ since it is not found everywhere. It is admirable for its tall, striated leaves or branches, ash-gray and armed with spines; its fruit is very pleasant and also sought by foxes. The trunk is soft like that of all cacti; nevertheless doors are made of this wood and are durable enough. The pulp of the trunk is used medicinally to cure liver ailments, etc. They say that it is even good for goiter. There is another species of cactus which grows to some 20 or 25 centimeters; it is round and thick, striated and armed with spines. In Chiriguano it is called "Zapapo." The children, as we shall see, make wheels by cutting off its spines, and, making it roll, they use it as targets for their arrows. Finally, there is another which is trailing and long, covering the ground where it grows and making the place impenetrable. This has and produces a very delicious fruit which is called "Tapiacaru" in Chiriguano.

TILANDSIA. -- This plant is known to the Chiriguano by the name of "Caraguata guaso." Its special place is the hills, and among them it has some more congenial to it; it grows well enough, and its leaves are extraordinarily broad and long and ash-gray in color; in the middle there is a thick stalk which rises quite high and is good wood for house rafters; from the crushed leaves they make cord and from these are made first-rate halters for tying up animals in the rainy season. The Tobas and even the Chiriguano make a kind of net which they call chiqa or "ulaqueca," which is very useful, inasmuch as the women can carry any weight in a bag of that kind; from the same they make nets so as to be able to fish in the rivers, and these are pieces of work which would attract attention in any part of the Old World.

/28 cont./

139 There is another small caraguata which invades wide areas
824 of land, preventing any animal from entering there, because
it has spines on the bottoms of the leaves. In times of scarcity
[262] its root is food for the poor Chiriguano; the root contains a
little starch which has the taste of mandioca, but it requires
[283] great effort to pull it up. The leaf of this tilandsia is also good
for making cord.

Finally, there is a third one which flourishes abundantly in trees and on the rocks of the hills, but which has no peculiar properties; it is large because of its leaves, which measure up to one meter in length. The plant is thick, the leaf fleshy, and it is used to decorate the streets with arches during processions. The aloe is similar to the second type of tilandsia, but aloe leaves are wide and thick, full of juice, while those of the tilandsia are slender, arched, and dry. The aloe is not abundant; only an occasional shrub or plant is found.

244 /29/ TOMATO. -- This plant which produces fruits so pleasant and useful to the culinary art flourishes exuberantly in these lands; the fruit from each plant is abundant and is produced the year round when some care is taken to protect the plant from the cold or from the light frosts which customarily
[237] fall in June and July. To do this it suffices to pile up dry cow dung in two or three places in the tomato patch and set them
[197] afire. True tomato plants are also found in the woods, but it is presumed that some bird must have carried the seed to such places; the tomato is a plant which has been brought into the Chiriguano country, as is the case with the onion, the sweet potato, and the cabbage.

222 In the woods there is a kind of tomato in the wild state which is somewhat similar in appearance and taste, but which is quite different from the true one; it is picked green and allowed to ripen in a room on top of a piece of wood; in a
[244] few days it turns red, which is a sign that it is ripe. The chili pepper also produces abundantly and with little care; it is a plant which lasts up to three years if care is taken to prune it, and the second and third years the fruits are very hot. Another kind of small, round chili pepper abounds in the woods and bears spontaneously; it is called arejivi by the whites and "quii rai" by the Chiriguano. It is hot, and some cure sickness,

222 [989] /29 cont./ IT IS HOT, AND SOME CAUSE SUBSTITS, or inflammation of the eyes, with it. Nevertheless, one should not confuse this little plant with another similar one whose fruits lack flavor and which is called by the Chiriguano "Aguara quii," which is to say, literally, "fox pepper," of the fox. The best way not to confuse it is to taste the fruit; it is found everywhere.

243 TRIGO /wheat/. -- The Eternal Creator of all things in his bounty and mercy arranged that this small plant, necessary in every aspect, should yield its fruit in every region inhabited by man; thus, in spite of the excessive heat, it is harvested here in abundance, and the farmer is not robbed of his hopes if he takes care to irrigate the field opportunely. Barley also flourishes in irrigated lands, but the cultivation of both has been abandoned for reasons already expounded in these pages and also because birds greatly bother both crops, as also happens in the rice paddies, which will be found empty if they are left to the discretion of our flying friends.

[824] [412] There also thrives together with maize, or in other places, the wheat called Guinea, or sweet sorghum, which the Chiriguano call "Trico" and which is indigenous; it is sweet, matures with maize, and they suck it, as well as the panicled sorghum, which is a kind of sorghum /30/ without sweetness and used for making brooms for sweeping. The seed of both plants is liked by birds.

● 139 824 [262] VID /grapevine/. -- Further on I have said that this plant pre-eminently required for the Sacrifice, like wheat, thrives quite vigorously in this region. I add here that in the woods there is a tree with small leaves and unimportant wood, which rises up to some eight meters above the ground and whose fruit is the size of an olive, has a dark coffee color and a flavor like that of the grape, matures in the month of February, is edible, and is called "Ivaviyu" in Chiriguano. Also in the wild state is the native grape with its twining trunk. Its fruits are like a bunch of grapes; they are white and some even black, and they are good for the manufacture of brandy.

/20 cont./

137 824 27 YERBA DEL DIABLO. -- This is the datura which is so abundant in the countryside and fields and which is a real plague. It rises to one meter in height, has branches, broad leaves, white flowers, and fruit armed with spines which, when dry, are enough to draw blood. The leaves and seeds make one lose one's memory. In this respect I remember one incident when an Indian woman absent-mindedly or out of ignorance covered an olla of hot food with datura leaves; half an hour later she ate it and it gave her a bad headache and a short spell of vertigo. Her little granddaughter, a schoolgirl about six years old, ate some also, and she suffered a complete loss of memory and all her actions were those of a demented person, a state which lasted some 24 hours. It seems that the Chiriguano [159] do not know that this plant and its seeds and leaves are poisonous; the latter, dried, are medicinal, alleviate the effects of asthma, and are prescribed for asthmatic Indians. Christians know it by the name of chamico, and the Indians by that of "caani," that is, painful herb.

137 824 SAPALLO /squash/. -- There are eleven species of this creeping plant, which I shall discuss in another chapter, only adding that watermelon and melon also grow here, as well as the cucumber and the beet. The "curugua" and the "curuguami" [242] of the Chiriguano are plants which are similar to the sapallo, but they climb trees and produce there an oblong, sweet, and fragrant fruit; when one enters a house, it is immediately evident if there are curugua fruits there; they are edible both green and ripe, but they are preferable in the ripe state.

I shall forgo describing many trees and plants whose [342] medicinal virtues are known; I shall take up others when dealing with medicines; however, below I forget it. I shall note here at the end of the flora that a region where /21/ there are damp places abounds in secular cedar, whose wood is used in carpentry for doors, windows, tables, etc. So that it may not be subject to rot, it is necessary to get mature plants whose color is light red; the whitish one is attacked by the wood borer; the odor of the wood is narcotic, and this property keeps away insects; its odor is similar to that of the cedar of Lebanon, and for this reason the conquistadors gave the name of cedar to this tree which the Chiriguano call "ñaiñaca," or stinking stick.

Small grove of palmettos in front of the house of Mans Ichaso. -- Salinas.

/87 cont./

797 the climate is very healthy, but the lack of food is continual, and they must often eat the roots of the serpentine arum, or mangara, bitter and poisonous before it is cooked (?).

> ?. Flora Cruceña of R. Peña. The fire makes it lose the poisonous part, but not all of the bitterness.

The buildings are constructed on a level site located on a small rise. The panorama which runs from north to northeast is [133] extensive and pleasant; there in the distance can be seen the hills of Taremacua and the cordillera of Ururigua, through which Nature opened a gateway to give passage to the waters of the Parapiti River, which fearlessly and with great boldness hurls itself from a great height, forming by its imposing waterfall a lake of white foam, like a boll of wild cotton, and then following its rapid course through San Antonio, Mariqui, Cumbarúi, and Isoso, /88/ where it is completely lost. Still farther beyond, to [137] the north and northwest, in the midst of a thick forest of quebrachos, [133] thickets, and secular algarrobas, are seen the tops of the ranges of Salinas and Timboirenta and something of Incahuasi, and at a short distance from the town is seen a round hill called "Tunpa repoti," the Chiriguano history and meaning of which I am not ignorant, and in front of the mission house, at the distance of half a league, are the pampas of Curuyuqui located among algarrobas and other trees; up to here the panorama of Yvu is similar to that of green Umbria of the kingdom of Italy. The [137] picture is dismal to the west and south, because the heart is oppressed by a consideration of the sands of the desert, however, much the springs of the west suggest the ancient and capricious fountains of the temples of Arcadia. Nevertheless, in the rainy season the hills and the plains garb themselves with fresh grass and wild flowers, lending to the nearby horizon a pleasant and varied appearance. The town is located at 770 meters above sea level, and at 20° 44' 35" south latitude, and 65° 50' 7" longitude west of the meridian of Paris, according to what is recorded in the

/172 cont./

342 824 The hardest part is finished with the previous operation; a short rest is taken, and then the owner of the new building must obtain enough hollow cane, engaging for this purpose Indians who have horses. But if the cane is very far away and has owners to boot, he gathers long sticks of astringent acacia or sebil and puts them horizontally every 15 centimeters on top of the rafters with the same above-mentioned lianas. Some [283] people, to tie the cane or sticks, use thin cords made from cowhide, but this, in addition to being more expensive, is less durable than bejuco (1).

[137] [178] [423] 1. Before the whites settled in Chiriguano country, hollow cane was abundant and had no owners; at the present time it cannot be found, and, if there is any, it is in private hands and must be bought.

Generally, before the walls are begun the house is covered with capíi, red straw, or, should this not be available, with capiáncua, straw for harnesses of beasts of burden, which is of inferior quality and very soon frays to pieces with the rain, sun, and strong winds, while the capíi may last for more than ten years.

[476] If it can be obtained by staying for a few days in a place where it is plentiful, he pulls it up there and reduces it to rather large handfuls; the gathering is done in several days, engaging Indians who own horses. When the material is in the town, he rests for a few days or weeks; he informs or invites those who wish to take part, in particular those who are closest to him by [354] kinship or friendship. These then go about tying the capíi between two horizontal canes toward the side of the roots, forming long, narrow lines, and when they are so placed, they attach them horizontally, beginning at the bottom and working /173/ upward or toward the ridgepole, where they leave a large vent to let out the eternal smoke of their inextinguishable fires (1).

1. Now the red straw is disappearing almost completely; the destruction of this necessary

/193 cont./

302 Another of the cosmetics frequently used by men and women
137 is the Carasapa. This is an annual plant with broad leaves, and
824 its stem grows /194/ to the height of a meter or a little more. The color of the plant itself and of its leaves is, for about half of it, somewhere between red and purple. The flower is large and about 30 centimeters long, its color being the same as that of the plant, but much brighter. There is enough of the plant everywhere, but it is not very abundant. The flower is somewhat heavy when it has seeds, and since the stem is slender and flexible, the result is that when it cannot hold itself upright it leans over toward the ground, forming an arch, hence its name Carasapa, or arched plant (1).

[527]

1. At carnival time even the neophytes paint their faces, as do the whites. They buy face paint which the whites sell, and the infidels forsake their achiote at the carnivals.

303 When the flower and seed are in season, the coquettes do their harvesting in order to use it, and they look pretty. The Carasapa also has its preparation, without which its application would not be easy. They first grind up some white beans, sift this meal very fine, and then grind the Carasapa in a mortar with a little water, put this mixture in a cloth, squeeze over the bean meal the water which comes out, washing or coloring it, and then dry the dough in the sun, spread out on a cloth or a Cutama. The preparation is not difficult, but not all of them go to the trouble to do it, and for those who prepare it, it is a profitable item.

302 The way to use it is the same as for the achiote, but it
[531] does not have any peculiarity, and hence it is only used at fiestas and at carnival time. Maidens beautify their faces by forming two circles of carasapa on their fresh cheeks and paint their eyebrows with achiote. Formerly, when young girls wore the Atira, pompadour /copete/, at fiestas it was painted with the carasapa mixture, after having been oiled with palma Christi.

/253 cont./

261 feed themselves with: algarroba pod, Hibope; chañar /a legume/.
262 Cumbaru; mistol /a fruit/. Tua; tuna, Hibopone; sour algarroba, Hibope tayi; nopal fruit, Saini; or from the fig, iva; the higuerilla /little fig/, Caicarina, the thistle /rando/, Tapiacaru, and the chala /a kind of cactus/, Ñancagüna (1).

[137] [132]

1. The fruits mentioned and many others are plentiful in the whole area, but in the Iva region they are more plentiful; the years have now greatly changed: it does not rain as regularly as in times past and the crops are somewhat certain only at the foot of the mountain ranges.

181 Indubitably the Chinguano, although superior to other nomadic tribes that surround them or border them, are very unfortunate and poor, but, on the other hand, their life is peaceful, they bother no one, and they do not wish to be bothered. When the Chinguano Indian has food, he is the happiest being on earth; his savage bliss can today be envied by all the rulers and great of the world who live without knowing whether or not they will wake up on the morrow, in view of being surrounded by so many anarchistic dangers, so many bombs and dynamite that the obscure sects make explode, so many excesses that occur and are reported in the newspapers, and so many deaths that are taking place. Oh, this kind of savagery has not penetrated among these savages! That is why they sleep peacefully without fear, in the town, in the countryside, and in the forest, and they are happier than others; those who seek bliss on this earth may well envy these Indians.

IV.

Hunting Equipment.

The Chiriguano and the Chané are not keen huntsmen. They are rarely seen out hunting. Their hunting-weapons are the bow and arrow, the pellet-bow, clubs, slings, and snares, all of their own manufacture. The Chiriguano have bird-nets too, and formerly they had the bola as well. The Chiriguano and the Chané have no weapons exclusively used in warfare. Formerly they had lances[1]).

The bow and arrow are going quite out of use among these Indians except for fishing and as a weapon for boys. The degenerate type of bow now seen among the Chané and Chiriguano is certainly not original. According to LOZANO[2]) the Chiriguano used to have bows of a man's height. It is of great interest to learn from LOZANO that the Chiriguano used to protect their left wrist with a small piece of wood to prevent the skin being grazed by the bow-string. Something similar occurs among the Ashluslay (see Part I. P. 40).

Their arrows are very like those used by the Chorotti and Ashluslay. The arrow shafts are of the same kind of reed[3]). At the Rio Parapiti this plant, which grows abundantly beside the Rio Pilcomayo is cultivated by the Indians. On the Rio Parapiti there is a place called Ouivarenda, which means where there is chuchio.[4] This plant, the *Gynerium* sp. whose seed-stalks so many Indian tribes use

177

Nowadays the Chiriguano and Chané for the most part eat their food with metal spoons which they have got from the Whites. They have, however, wooden spoons as well. They generally eat from earthenware bowls of their own make. They seldom have wooden bowls. I have already treated of the distribution of the wooden bowl and the wooden spoon. (Part 1 map 12 and 13.) They are features of western civilization. Calabash bowls are universally used by the Chiriguano and Chané as drinking vessels, particularly for chicha.

C
415
177

Silver bowls — »Cagua» — are occasionally seen at the Chiriguano festivals. These bowls, which are shaped like cloven calabashes, are often furnished with small ears and are made by mestizo smiths to suit the Indian taste.

C
Ce
415
[439]

There is in my collection a calabash bowl that has been turned into a ladle by means of a handle. It is from the Chané at the Rio Itiyuro. I have also procured some bowls made of the fruit of the calabash tree from the Chiriguano. The Indians get them from Sta Cruz de la Sierra, for, as far as I know, the calabash-tree is not cultivated within their own area.

earrings with real "diamonds," rings with "sapphires," or other fine things, which she could then show off at the next drinking bout. 123 439 437

There are always two villages in these mission stations, one for the heathens, one for the Christians. I myself always felt more comfortable in the former, and this not only because more fine, old things were to be collected there, but also because the people there were friendlier, more tactful, and more polite in their behavior. The mission children were importunate and impudent. 361 797

Near Machareti there is a large basin-shaped valley through which flows a little brook that probably swells to a roaring river after a violent tropical rain and disappears in the wilderness of the Chaco. Quite near the mission it leaves the handsomely dissected mountains, where small petroleum springs trickle out everywhere in the crevices of the cliffs. Then it flows through a hilly landscape that gradually turns into the vast flat area of the Chaco. The vegetation in these regions is not very luxuriant. The woodland, when such is present, is sparse, low, shrubby, and monotonous. The fields seem to produce abundant harvests, the drought seldom too long. These regions are often devastated by huge swarms of locusts. I have seen these destructive animals cover the woodland like large, reddish-brown clouds. 133 [135] 137 241 731 136

From Machareti we went by way of Itatiqui, a very interesting Chiriguano village in an arid region, to the Rio Parapiti. 114

The latter comes from Pomabamba and Sauzes, from the /153/ mountains of the Quichua /Quechua/ Indians. After it has left these, in the rainy season, it is a roaring stream overflowing its banks. In the dry season it carries little water. The Rio Parapiti also ends in the Chaco. During the rainy season it is lost in the swamps; in the dry season it disappears in the fine sand. If the Rio Parapiti parades on the maps, as the southernmost tributary of the Amazon River, this is only empty boasting on its part. The woodlands along the Rio Parapiti consist mostly of bushes and low, fine-leaved trees, caraguata, and cacti. 133 137

/155 cont./ C
Pilcy and finally unites with the Rio Mamoré. A few Chiriguanos 133
live along this river, and savage Tsirakua and Sirionó also [01]
rove about in the forests along it. C

Between the Rio Grande and the Rio Parapiti there is a 133
region with an extreme scarcity of water and largely covered 137
with completely impenetrable underbrush and low scrub forest 312
full of caraguata and cacti. This monotonous, dismal vegetation is interrupted here and there by hills and grassy plains. C

Besides the savage Tsirakua Indians who make these thickets 136
unsafe, one finds another curiosity here, namely the guanaco C
(Auchenia). It is altogether strange to find an animal like the [032]
guanaco, which one thinks of only in connection with the cold plateaus of the Andes or the /156/ pampas of Patagonia, often afflicted with frost, in this bush which is frequently scorched by droughts. It would be interesting to be able to determine whether this guanaco of the tropical forest is really the same as the one known from the colder regions. Intelligent whites with whom I have discussed this and who have seen both regard them, however, as the same species.

Having returned to the Rio Parapiti, I looked up Batirayu, Ca 115
with whom I had already become intimately acquainted in 1908 and who also speaks excellent Spanish.

With no other Indians with whom I became acquainted did I become as close as with Batirayu. He understood that I was collecting the old mementos out of an interest in his tribe. Batirayu did his best to explain to me the religious conceptions of his tribe. In the evening we used to sit in his room with a cigarette, and he told about olden times, sorcerers, chiefs, Ca and spirits. Occasionally an old chief, Bóyra, also came, and [022] from him I heard many charming Chaná legends. We would sit until far into the night and chat by a flickering light that I had with me in order to take notes. Ca

One would be very much mistaken if he were to believe that 115
the conversations with these men were merely an interesting 123
study. I felt comfortable with these fine, tactful, yes, why not, cultured human beings. It was genuinely refreshing after coming
from the often vulgar, empty whites.

/110 cont./

In the village of Cuevo alone 65 out of 200 persons died within a short time. I visited the 140. They were as gay as ever. Spirits and beer were consumed in quantity.

Father Bernardino was never given credit for this work, but rather the medicine men, who had bewitched the sickness so that it would not come to Ivo. The white colonists, too, occasionally had the medicine men come in order to /Fig. 78 appears here/ drive away the sickness. They did not believe in the vaccine either.

With Ivo as the starting point, I made a trip into the

Fig. 77. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/6.

Iguembe valley, in order to visit the Chiriguano chief Maringay. It was a charming ride on horseback up on the high crests and down into deep valleys, through an ochre grandiose, colorful landscape. These valleys are poor in forests. Only in a well-protected ravine in which a brook trickles forth is the vegetation luxuriant.

I soon became very good friends with old Maringay. The old man was conservative, clung to the old customs, and felt that the Indians should be on good terms with the whites, but should preserve their old habits and customs unchanged. His village was extraordinarily interesting and very rich in old, fine things.

/119 cont./

things. The ceramics /160/ which I found there belong among the very best that I saw among these Indians (Figs. 77 and 78).

From Maringay I returned to Ivu by way of the mission station of Santa Rosa. It has a wonderful location. Like an old fortress, it is built on a narrow hill. Below it, in long rows, lie the grayish-brown Chiriguano huts surrounded by low woods of [illegible], [illegible], small algorrobas, and other fine-leaved trees. This woodland is seldom so dense than one cannot easily get out of it without a bush knife. When I was in Santa Rosa,

Fig. 78. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/7.

it was the dry season and everything was burned up. Here too, however, rain probably entices the green out of the dry earth. Sometimes the rain is so long in coming, however, that the Indians do not get any maize and that means -- hunger.

From Santa Rosa one looks far out over the mountains and across the great plain of Boyuovis, over the country that was the native land of the Chiriguano, where, at Curuyuqui, they fought their last battle with the Christians, who assume the right to rob all weaker peoples.

After my excursion to Maringay I left the land of the Chiriguano and Chané and paid my second visit, already described in this book, to the Choroti and Ashluslay.

on the Rio Parapiti make raids on the Tekoluo Indians. The Ashluslay also maintain, as my interpreter told me, that /172/ the Toba chief Teyoolique, during his invasion of their territory in 1909, had several Chiriguano with him.

Batireyu said that in former times the Chané brought home the heads of their slain enemies and set them up on the plazas of the villages during festivals.

Chapter Eleven

From the Land of the Chané and Chiriguano Indians

Everyday Life in the Chané and Chiriguano Huts

As a rule, I felt very comfortable in the huts of the Chané and Chiriguano. The life in these villages is exactly the same. If one describes one village, he has described almost all of them.

Like all the other Indians whom I visited south of Santa Cruz de la Sierra in Bolivia, these Indians live in villages. Some of these villages are quite large and inhabited by several hundred persons. Often many villages lie close together. The huts, as a rule, lie around a market place on which sweetsop trees are occasionally planted for shelter in the rainy season. The market places serve as playgrounds and meeting places. The huts, in contrast to the round Choroti and Ashluslay huts, are square, and their doors, facing the village, are set in the gable. They are made of cane or wooden slats, with roofs of grass. Not infrequently they are plastered with earth.

/181 cont./

Branches of Subsistence

Fishing and hunting do not play an important role among the Chané and Chiriguano. As I have mentioned before, they are farmers, primarily maize farmers. These Indians live so exclusively on maize that for them all other food plays a subordinate role. The Indians living on the Río Parapití are an exception: they plant more sweet potatoes than maize, and these yield an excellent harvest in their country.

/182/ The following plants are grown by the Chané and Chiriguano:

Sweet potatoes.
Maize.
Squash (Cucurbita pepo Lin.).
Calabash fruits.
Beans of different varieties.
Cotton.
Urucú.
Tobacco.
Tuna (for example, at Yatavéri). Opuntia.
Millet.
Mandioca (rare).
Reed for arrow shafts (on the Río Parapití).

In the plantings of these Indians I saw neither ordinary potatoes nor bananas. The sweet potatoes, according to Batiraya's statements, were introduced at a late period by the whites. Tobacco-raising is insignificant. The Chané and Chiriguano are not great smokers. They mostly smoke cigarettes in maize leaves, seldom pipes (Fig. 88). Among them one need not give his pipe to a neighbor for further smoking.

It is strange how the use of tobacco differs among the Indian tribes. The Aymara and Quichua /Quechua/, who chew coca, very seldom smoke. They have no taste for it. The Chacobo and Atahuaca, two tribes with whom I became acquainted on my travels, smoked just as little. When I offered a Chacobo a

/177/

539 When the girl reached home, a bird, "Arapu" /pro/, cried that she was pregnant. The next day she grew big. She was in an advanced state of pregnancy. Her mother was provided. She said she wanted to go far away to the Sabes and give birth. Inimu went to the cave of Tatutupa and dropped the child in it, without giving it milk. The child grew daily, and the mother looked after it, but when she came, it crawled into the cave. One day "Tabuke" came, the jaguar with two heads, one of which was dry, tore her eyes out, and led her away alive.

The grandfather now went out to catch little Tatutupa by placing in front of the cave a net, in which he was caught. He led him home. There he grew rapidly and began to become big. He was brought up on honey. One day little Tatutupa demanded bow and arrow. His grandfather made him an arrow with a blunt point of wax. With that he went out and hunted. When he hit the trunk, all the pigeons fell down dead. There was a great quantity. When Tatutupa came home, his grandfather asked him how he was able to kill so many pigeons, and then he told how it happened. In the same way he killed many birds. One day he saw five arapu birds on a tree. Tatutupa shot at the tree, but only four fell down. The fifth said: "You would do better to look for your mother than to shoot birds."

When Tatutupa reached home, he asked his grandfather to make him a club out of "hairapuru" (1). He hit it against a

•/37/] 1. Hairapuru is a soft wood (Salix Humboldtiana).

thick tree trunk, but was obliged to hit twice in order to get the trunk off. Tatutupa told his grandfather it was worthless and demanded a club made of "urundey" (2). He hit it against a thick

2. "Urundey" is red quebracho or something similar.

tree trunk and struck off the trunk with one blow. "This one is good," said Tatutupa.

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these outwardly allied tribes. After the last great Indian rebellion against the whites (in 1892), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly gourd plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani-group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Paraguay.[2] The name of Chiriguano (quichua), which means «dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word «guano» is the same for the well-known bird manure-found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Puna and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

with that of Tarija because the inhabitants of the missions of both colegios were of the same Chiriguano race.

/110/ The illustration placed at the beginning of this chapter /see p. 148/ is one of the said photographs; it shows a group of Chiriguano women with their festive clothing and adornments, who are ready to attend a public gathering for drinking; it was made in the Boicovo Mission and taken with the others to the exposition. The group of Indian day laborers is reserved for the chapter which deals with work and chores; both groups show the physical constitution of the race, about which Señor del Campano, after the exposition was over, wrote his book; perhaps this gentleman also had seen the four Chiriguano who were brought from the Tarija missions (1).

[113]

After having studied the territory that a tribe occupies and consigned to paper what is most characteristic, and, next, having discovered appropriately by means of traditional and historical data or well-founded suppositions the origin and derivation of the tribe, the first thing that is exhibited to the ethnographer and to any observer is the physical body; its proportions, whether large, small, or average, soon strike the eye, the latter, the observer, considers mentally what the former, the physical ethnographer, sees, and begins his narration and then goes on to the character.

/13 cont./

166 towns from which one man had come from each one. From Charagua, Parapití, and Carapati two had come from each one, four from Ingre, five from Santa Rosa, and eight from Machareti. Unfortunately, the native soil of the Chiriguano women was not stated, and it is only said that they came from Bolivia.

141 The average height of the Chiriguano men measured by Lehmann-Nitsche is 163.4 cm., and the height of the Chiriguano women measured is 151.7 cm. This average height of the women measured is not a little less. The average height of the eight men from Machareti was only 161.8 cm., and that of the two men from Parapití only 158.1 cm. But the average height of the four men from Ingre was 169.15 cm. The tallest of the Chiriguano men measured, who had a height of 178.6 cm., had come from Ingre, and the shortest, with a height of 153.5 cm., from Machareti. The smallest woman (between 35 and 40 years old) was only 143.0 cm., and the tallest, 158.0 cm. These numbers show us that the height of different Chiriguano individuals is quite variable. Among the Chiriguano measured by Lehmann-Nitsche, the number of those who came from the same region is too small to be able to make exact deductions about the differences in height of the Chiriguano of the various regions in order to be able to clearly demonstrate the somatic influence of mixture with other tribes.

14 The photographs of Chiriguano types published by Lehmann-Nitsche show great variations among the different features and bodies, which corresponds to the fact that the present-day Chiriguano are the product of a mixture of various ethnic elements.

113 114 142 Good photographs of the Chiriguano of the southern part of their territory can be found in the publication of von Rosen, Ethnographical Research Work during the Swedish Chaco-Cordillera Expedition, 1901-1902 (48). Erland von Nordenskiöld

114
[113]

1. Guillermo Robertson. Historia de América desde el descubrimiento hasta antes de la Independencia /History of America from the Discovery to before Independence/. Travelers exaggerate their stories in order to attract more attention.

144 There are extensive areas where mixture of the two
[191] races was frequent, but it must be pointed out that in these
[142] areas the children of such have ceased to be Chiriguano, both because of the Spanish language, which they now speak perfectly, and the color, which is completely different; it is no longer parchment, as Father Corrado states, but a skin which is up to a certain point fine and velvetlike, so that for this class of persons who descend from white and Chiriguano the appropriate name is mestizo and not Chiriguano, and consequently the physical characteristics of the race have not changed. In these same areas families which have kept pure Chiriguano blood are not rare, and these families, or the individuals which make them up, have the same characteristics as other Chiriguano, without any noteworthy difference (2).

2. From the left bank of the Parapiti River northward this radical change is taking place, making the race disappear.

On the contrary, in the great Chiriguano centers, such as all the missions and a few other areas outside of them,
141 the physique of the native has not changed at all. As a
142 rule their stature does not reach one meter and 70 centimeters in men, and rare are the women who reach 1.60; the hair is black, glossy, and coarse, and very vigorous in

/111 cont./

141 both men and women, and fair hair indicates either an
142 oddity or a clandestine affair. The forehead is rather small, as are also the languid, downcast eyes; the face is round, the nose flat, the mouth wide, the denture white as ivory, the chin short, and the lips rather thick. /112/ The
142 men do not wear beards, and anyone would believe that they
302 are beardless, but the main reason why they do not have one is that they pull out the hairs as they grow, and for this they have some tin tweezers with which they make all the hair disappear, and they do well, because otherwise, in view of their slovenliness, with long beards they would really be orangutans (1).

[186] 1. The Toba call the Chiriguano tigre face because of his round face, and the latter gets back at them by calling them horse face because of their long faces. In the missions the neophytes wear mustache and goatee.

141 They have a chest thrust forward, rather heavy
[291] shoulders and arms, normal-sized hands, and not very big feet, in spite of the fact that they grow as they will since they always go barefoot, especially the women, and not
147 all of them wear sandals /ojotas/. When they are enjoy-
[853] ing good health, they are very robust, and the women without the slightest bother will nurse two babes at their
[609] breasts. Whenever some white Christian woman is not able to nurse, she usually seeks out a Chiriguano woman to wet-nurse her child; this, in addition to being very advantageous because of the goodness of the blood, is also quite eco-
855 nomical. But it is true that most Indian women do not
[609] wish to take care of children other than their own; most
[466] of the time they agree to it with reluctance, or by force, this last occurring when the Indians are subject to a master.

[P. 190 is blank]

142 To me, the Chiriguano seemed to be of better physique than both the Puna and the Chaco Indians, and their cast of features, as a rule, to be less rough-hewn than those of the above-mentioned tribes. Herma ten
141 Kate has taken anthropological measurements of four Chiriguano men,
[127] whose average height was determined at 160.1 cm.[1] Lehmann-Nitsche, who has made anthropological observations of 50 Chiriguano (40 men and 10 women), is my authority for the data I have grouped together in the subjoined table.[2]

The Chiriguano; some physical data.

Sex	Average height, cm	Shape of skull	Colour of skin, Luschan's scale	Colour of hair, Fischer's scale	Iris, by Martin's scale
Men.....	163.4	Dolichocephalic — mesocephalic	Majority 22	Majority 4	Majority 3—4
Women.....	151.7	Dolichocephalic — mesocephalic	Majority 18	Majority 4	Majority 3—4

142 The Chiriguano complexion is, accordingly, brown with a tint of yellow; the iris is dark brown, the hair black, coarse and lank. The growth of hair on face and body is very scanty.

361 The Chiriguano are not a nomadic people, but live in permanent villages, some of which are the abode of only a few families, whilst others contain
[114] several hundreds of inhabitants. At Ibitibi I was studying a Chiriguano village that, according to the Indians, was inhabited by about 300 people. This village was situated on a plain surrounded by wooded mountains (fig. 188). The huts formed a large circle, with the chief's hut in the centre. In the open space between the chief's hut and the rest, there were growing some close-foliaged trees (probably of the Bignoniaceæ family), affording much-needed shade. In earlier literature it is stated that
[574] the Chiriguano used to build a hut for strangers in the middle of the
[609] village plaza.[3] In many of the Chiriguano villages I visited, the huts were scattered about without any perceivable order.

342 The huts are rectangular and with ridged roofs. (Figs. 188—192.) The walls either consist of perpendicular sticks, of tree-branches or reeds,

published the results of these measurements, together with measurements of other Indians, and added to that publication in the first 12 plates Chiriguano types photographed by Carlos Bruch. In addition to the somatic measurements, determination of skin color, eye color, and hair color and form have been published by Lehmann-Nitsche. Thirty-six of the 40 Chiriguano men stated where they had lived, and from this we know that these people had come from various regions of Chiriguano territory to the San Pedro sugar mill. There were some who had come from the northern regions, and one had come from the city of Santa Cruz de la Sierra. Others had come from the south of Chiriguano territory, for example, from the town of Carapati, located considerably to the south of the Pilcomayo River. There are named 13 Chiriguano

Of the seven Izozó bows, the first four on the list are good specimens made of hard wood and correspond in all details to the Chiriguano bows described by v. Rosen (187), except for

187. v. Rosen, op. cit., pp. 206, 208.

their length, which is a few centimeters less than these. This difference in length is easily explained by the fact these Chiriguano bows were collected by v. Rosen in 1901 and 1902. It would be difficult today to find still among the Chiriguano bows as long as those which v. Rosen acquired 35 years ago. From Lizarraga's statement that the Chiriguano bows were of the same height as the bowman, it is evident that the bows of these Indians were formerly [illegible] longer than those described by v. Rosen. If, following [illegible]ehmann-Nitsche's somatic measurements mentioned above, we set the average height of Chiriguano men at 1.63 m., there is still a difference of 18 cm. between this figure and that of 1.45 m., which is the length of the longest bow among those collected by v. Rosen. We must consider this shortening of the Chiriguano and Chané bow,

(Photo. A. II.)

touched by //Plate VI appears here// /341/ the interest that my wish implied and in an instant showed himself ready to do the honors.

His field was about 700 meters from the village on top of one of the cliffs which border the "quebrada" /ravine/ of Caranti. Access to it was by a steep path across fallen rocks. The entrance to the field was closed by a hedge composed of tree trunks and thorny shrubs which we climbed over with the help of an Indian-style ladder, that is, a thick branch with deep cuts for steps.

114
[113]

1. Guillermo Robertson. Historia de América desde el descubrimiento hasta antes de la Independencia /History of America from the Discovery to before Independence/. Travelers exaggerate their stories in order to attract more attention.

144 There are extensive areas where mixture of the two
[191] races was frequent, but it must be pointed out that in these
[142] areas the children of such have ceased to be Chiriguano, both because of the Spanish language, which they now speak perfectly, and the color, which is completely different; it is no longer parchment, as Father Corrado states, but a skin which is up to a certain point fine and velvetlike, so that for this class of persons who descend from white and Chiriguano the appropriate name is mestizo and not Chiriguano, and consequently the physical characteristics of the race have not changed. In these same areas families which have kept pure Chiriguano blood are not rare, and these families, or the individuals which make them up, have the same characteristics as other Chiriguano, without any noteworthy difference (2).

2. From the left bank of the Parapiti River northward this radical change is taking place, making the race disappear.

On the contrary, in the great Chiriguano centers, such as all the missions and a few other areas outside of them,
141 the physique of the native has not changed at all. As a
142 rule their stature does not reach one meter and 70 centimeters in men, and rare are the women who reach 1.60; the hair is black, glossy, and coarse, and very vigorous in

/111 cont./

141 both men and women, and fair hair indicates either an
142 oddity or a clandestine affair. The forehead is rather small, as are also the languid, downcast eyes; the face is round, the nose flat, the mouth wide, the denture white as ivory, the chin short, and the lips rather thick. /112/ The
142 men do not wear beards, and anyone would believe that they
302 are beardless, but the main reason why they do not have one is that they pull out the hairs as they grow, and for this they have some tin tweezers with which they make all the hair disappear, and they do well, because otherwise, in view of their slovenliness, with long beards they would really be orangutans (1).

[186] 1. The Toba call the Chiriguano tigre face because of his round face, and the latter gets back at them by calling them horse face because of their long faces. In the missions the neophytes wear mustache and goatee.

141 They have a chest thrust forward, rather heavy
[291] shoulders and arms, normal-sized hands, and not very big feet, in spite of the fact that they grow as they will since they always go barefoot, especially the women, and not
147 all of them wear sandals /ojotas/. When they are enjoy-
[853] ing good health, they are very robust, and the women without the slightest bother will nurse two babes at their
[609] breasts. Whenever some white Christian woman is not able to nurse, she usually seeks out a Chiriguano woman to wet-nurse her child; this, in addition to being very advantageous because of the goodness of the blood, is also quite eco-
855 nomical. But it is true that most Indian women do not
[609] wish to take care of children other than their own; most
[466] of the time they agree to it with reluctance, or by force, this last occurring when the Indians are subject to a master.

/112 cont./

142 The Chiriguano at the time of birth has a color which is difficult to define, but, and let nobody laugh at this, his color is that of newborn mice, and as he grows the color changes until it is that of sunburnt parchment. The causes [147] of this change are the tropical heat, the sudden winds and changes, and the burning sun, to the action of which they expose themselves with untoward pleasure, with no bother and without fear, even should they be but tender infants.

441 147 From this it can easily be deduced that the Indian does not fear the canicular sun, or heat either; he works on the hottest days without shirt, trousers, or anything which re- [291] sembles these; he stretches out full length, very content, [516] receiving on his back the rays of the firey sun, and nothing daunts him. But when the north wind changes to the south and consequently the cold begins and the frost comes, he is very cowardly, and it is hard to make him work well and happily; in such cases it is easier to suspend the work for a few days, not to pay the laborers anything at all, and not to get uselessly angry; but this can only be done when the suspension does not have any bad effects (2). /Illustration appears here./

2. It is not only the Chiriguano Indian who hates the cold, but also the other races of America, such as, for example, the Quichua /Quechua/, according to what the historian Robertson says.

165 /113/ Life Span

The Chiriguano normally lives a good many years; he is little affected by heat, cold, and the inconstancy of the climate, nor by drunkenness and self-indulgence, to which capital vices he abandons himself from a tender age. Some [145] reach and pass 100 years, judging their longevity by their hair, since their hair does not turn white except at a very

[Text Continues on P. 156]

/113 cont./

165 [145] advanced age, and I have seen Indians with the head completely white, and others with a white the color of smoke or something smoked. In the performance of my ministry I have met and baptized many centenarians at the time of their death, and in the towns through which I have passed I have met several who fought in the Caraparí war and who witnessed the War of Independence.

273 276 [178] But today the Chiriguano has degenerated greatly: in somewhat distant times they did not know about either liquor or coca, and today both are general, and because of liquor and coca, the use of which they much abuse, they ruin their health and shorten their existence. Much youth disappears with the abuse of these substances, and as a general rule in the missions the best disappear, those who know some art or have some fortune; all that they earn, after buying their clothing (although not always), they invest in liquor and coca, and [165] [648] thus shorten their lives. I have seen towns where out of 40 or 50 young men of the same age there are scarcely two or three alive who will reach 50; it can thus be seen that the drunkenness produced by chicha is not so pernicious as that of liquor or alcohol, for which any tax imposed on them by the Supreme Government is never too much, and would that such a tax were higher, more general, and that it was not felt to be enough [142] [147] simply to write it out. In spite of this dissipated life, it is very rare that one encounters a bald Indian, which indicates great robustness (1).

1. I have known many large and small Chiriguano towns; I have only found three semibald persons.

Morality

181 At present the Chiriguano Indian differs slightly or not at all morally from the common mass of men. I mean that not all are good nor are all perverse; there are good ones and bad ones

Cacique Güirasa with His Family

/210 cont./

Infant Care

854 [352] For the newborn child to rest in, they have a kind of net which they hang at one end of the lodging. Its mother places it there when it sleeps, and she covers it with a piece of cloth so that the flies will not bother it. Some wool or cotton hammocks are crudely made /211/ by them, and these are called Ini ó quiha, the last term of which literally means quietness.

The mother almost never leaves her newborn child, and to go to the spring or to the river she takes advantage of the time when it is asleep, leaving it in the care of some person, even a little one. She cannot yet carry it in the folds of her clothing, because the child's tender limbs cannot bear such a position. Only when they have become somewhat stronger does the mother walk from one end of the town to the other, to the field, to the spring, without leaving her child at home, like weasels or like the kangaroos of Australia, who do not leave their young in the caves when they go out, making leaps like a jerboa.

147 854 The sun in the Chiriguano region is very hot and yet children exposed to its action do not feel its effects very much, if at all. They receive its rays perpendicularly, from in front, from all sides, and square on their faces, and it is as though they were in the shade. The only effect that it has on them is the copper color of the race, because experience has shown that this color is acquired (1).

• 142 1. The color of the newborn babies is rather strange; they look like mice. Many newborn babies are completely white, but not like Europeans; the difference between the former and the latter can be seen immediately.

Ee
361

All Chiriguano and Chané men of the older generation and, in a few of the Chiriguano villages, the younger men and boys also wear a so-called *tembeta* or lip-button in the under-lip. The custom of boring the lips is wide-spread in S. America. Dall, Dixon, Nuttd, Uhle and Verneau-River have drawn up summary tables to which I beg to refer, at the same time making some additions based on notes I have made from the literature on the subject to which I have had access.

Ee
304
171

The tembeta of the Chiriguano and Chané Indians is made, as a rule, of tin and in shape reminds one of a cap with a peak at both the front and back. (fig. 25)

Ce /164 cont./
829 referring when he addressed a farewell speech to /165/ me, which began as follows: "Now you can tell your great chief that you saw us and our poverty..."

G S The sense of direction of the Indians has been discussed a
823 great deal. The Indian undoubtedly has a very highly developed gift of observation, but his sense of direction is not so
G considerable. I wandered with the Guarayú Indians in east-
823 ern Bolivia for about 250 kilometers in deep, large forests which they did not know, and in which we often had to cut a path,

C
142

G step by step, with the bush knife. When the sun was covered
823 with clouds, they often led me astray, as I could see by my compass. For a white man transplanted directly from city life into the wilderness, the Indian's intimate acquaintance with nature is remarkable. If one is accustomed to this life himself, he looks at the matter differently.

/214 cont./

577 entirely untouched by the civilization of the whites, an opinion
831 which I shall reproduce here verbatim:
175

"Ce qui m'a fort surpris, c'est que dans la licence où ils vivent, je n'ai jamais remarqué qu'il échappat à aucun homme la moindre action indécente à l'egard des femmes, et jamais je n'ai oui sortir de leur bouche aucune parole tant soit peu déshonnête

643
291
415
142
352
516

Fig. 111. The Chiriguano chief Mandepora.

577 /What surprised me very much is that in the freedom in which
831 they live I never noticed the slightest indecent behavior on the
175 part of any man with regard to women, and never did I hear from their lips any word that was the least bit immodest/."

/214 cont./

581 This Jesuit priest describes the marriages of the Chiriguano, however, as very loose.

581 273 With marriage, life begins in earnest for these Indians. It consists of work and drinking maize beer. I have already described their work somewhat; I shall discuss their drinking bouts below.

165 The life of the Indian men and women passes more quickly

● 142 291 516

Fig. 112. Old woman. Rio Itiyuro.
Her grandsons were about 18 years old and younger.

165 than that of whites. The age of the Indian is very difficult to determine when one has no definite figures to go by. Maringay told me that he was the oldest of his tribe, that none of his contemporaries was living any more. The whites said that Maringay was over 100 years old. This is exaggerated, however. As a newly married /215/ youth 16-20 years old, Maringay visited

C /215 cont./
165 President Belzu in Sucre. The latter governed between 1848-1855; thus, 100-year-old Maringay is obviously not more than about 80. An 80-year-old Indian is therefore the oldest of his tribe.
C 145 Among the Indians one almost always sees /Fig. 112 appears here/ that the one who has grown-up grandchildren is very frail and senile and stands at the brink of the grave. Indian men and women
C mature very rapidly, but also age quickly. At 50 the Indian is an
[114] old man, at 70 a so-called centenarian. Im Thurn (1) likewise

1. Im Thurn, op. cit., p. 190.

believes that the Indians do not grow old. /216/ He thinks that
C they seldom reach an age older than 40 or 50.
●142 Maringay's hair was slightly gray. There are some Indian men and women whose hair is almost whitish yellow, but they are
C [145] rare (Fig. 112). I never saw a bald Indian. When they are older,
[164] their faces are deeply furrowed. Not infrequently they become blind in old age, less often deaf.
Ee Among the Choroti and Ashluslay the appearance of old
142 people is often frightening; they are dirty, emaciated, and
515 bleary-eyed. This is not the case among the Chané and Chiriguano. These Indians know how to grow old in beauty, and even the old people keep themselves nice and clean.
Ee If the Chané or Chiriguano Indian becomes seriously ill,
756 the medicine man is sent for, as among other Indians.

The Chiriguano and Chané distinguish between two kinds
Ee of medicine men, whom they call "ipáye" or "ipáyepótchi." The
[754] former are good and lift the spell; the latter are able to lift the spell and to bewitch.
C I once jokingly asked a Chiriguano whether Father
756 Bernardino in Ivu was an "ipáye" or an "ipáyepótchi." The Indian
797 answered dutifully, an "ipáye." The position of the missionary among the Indians is that of medicine man; he assumes their power and their influence.
Ee In the preceding I said that the whites in the vicinity of
756 Ivu sent for an Indian medicine man to drive away smallpox.
177

[P. 190 is blank]

142 To me, the Chiriguano seemed to be of better physique than both the Puna and the Chaco Indians, and their cast of features, as a rule, to be less rough-hewn than those of the above-mentioned tribes. Herma ten [141] Kate has taken anthropological measurements of four Chiriguano men, [127] whose average height was determined at 160.1 cm.[1] Lehmann-Nitsche, who has made anthropological observations of 50 Chiriguano (40 men and 10 women), is my authority for the data I have grouped together in the subjoined table.[2]

The Chiriguano; some physical data.

Sex	Average height, cm	Shape of skull	Colour of skin, Luschan's scale	Colour of hair, Fischer's scale	Iris, by Martin's scale
Men.....	163.4	Dolichocephalic — mesocephalic	Majority 22	Majority 4	Majority 3—4
Women.....	151.7	Dolichocephalic — mesocephalic	Majority 18	Majority 4	Majority 3—4

142 The Chiriguano complexion is, accordingly, brown with a tint of yellow; the iris is dark brown, the hair black, coarse and lank. The growth of hair on face and body is very scanty.

361 The Chiriguano are not a nomadic people, but live in permanent villages, some of which are the abode of only a few families, whilst others contain [114] several hundreds of inhabitants. At Ibitibi I was studying a Chiriguano village that, according to the Indians, was inhabited by about 300 people. This village was situated on a plain surrounded by wooded mountains (fig. 188). The huts formed a large circle, with the chief's hut in the centre. In the open space between the chief's hut and the rest, there were growing some close-foliaged trees (probably of the Bignoniaceæ [574] family), affording much-needed shade. In earlier literature it is stated that [609] the Chiriguano used to build a hut for strangers in the middle of the village plaza.[3] In many of the Chiriguano villages I visited, the huts were scattered about without any perceivable order.

342 The huts are rectangular and with ridged roofs. (Figs. 188—192.) The walls either consist of perpendicular sticks, of tree-branches or reeds,

 [P. 194 is blank]

seen any Chiriguano using this typical ancient Andean garment. Ponchos of the cloak type, and robes of the kind used by the Chaco Indians, on the other hand, I have seen worn by the Chiriguano men, who put them on against cold and wet. Formerly the Chiriguano men dressed in the »chiripa», which was a rectangular skirt that was fastened in front to a cord tied round the waist, then passed between the legs, and fixed to the cord above the buttocks. One may still see, here and there, some small boy wearing nothing but this primitive garment. On their heads the men often wear a broad, red. turbanlike frontlet (fig. 194), and, when setting out on long marches, they put on their feet sandals, the straps of which bear distinct resemblance to straps on sandals that have been found in ancient graves on Puna de Jujuy.[1]

Fig. 195. Chiriguano boy with long, flowing hair. San Luis. Bolivia. Photo. E. v. R.

The women also possess sandals, but, like the men, generally walk about barefooted. The women's clothing consists of a loose-fitting, tubular garment made of woollen, or cotton, stuff. It is called »tipoy». The upper part of it is pinned together over the shoulders by means of cactus spines or metal pins, in the manner seen in fig. 190, which leaves the arms free, or the garment may be fastened under the armpits in the way the girl in fig. 194 is wearing it.

Nowadays the men mostly wear their hair bobbed, and with a frontal fringe (fig. 194), but I have seen boys, not fully grown, with long hair, hanging loose down (fig. 195). In former days all the men had long hair, which they gathered on the top of the head, where it was secured with a frontlet, a custom not yet quite discarded in some out-of-the-way parts of the country. The women let their hair grow long, give it a centre parting on the top of the head (fig. 190), plait it into tresses and tie it up, or allow it to hang loose. One may sometimes see girls with short hair (fig. 194), but in such cases the hair has been cut short as a sign that its owner has entered upon her first menstruation. On the death of a near relative it is also the custom of the women to cut off their hair.

C 144 648 Ce 648 From the preceding historical sketch it can be seen that the ethnic entity "Chiriguano-Chané," with regard to its physical characteristics, is made up of an ethnic mixture of absolutely heterogeneous elements. We have told how the Chiriguano for centuries captured many prisoners, incorporating them into their community, and how at the end of the 16th century the number of Chané incorporated among them was much larger than that of the pure Guaraní-Chiriguano. Although the Chané, belonging to the linguistic group of the Aruacos /Arawak/, were a peaceful nation and were not equal in strength to the pure Chiriguano, their culture, which for a long time was in contact with that of the ancient Peruvians, was doubtless superior to that of their oppressors, and the Chané women surely had considerable influence on their masters. Since the two population elements lived together for three and a half centuries, we must suppose that they would have mixed extensively.

C 142 175 Unfortunately, the ancient documents say very little about the physical qualities of the Chiriguano. The only brief note on this subject that I know of is found in the "Descripción y población de las Indias" by Bishop Lizarraga (44): "They are

44. Moreno II, p. 101.

C [302] Ce 144 175 comely, robust, with broad-shouldered, high chests, well built, dark. They pluck their eyebrows and eyelashes; the eyes are small and lively." According to Father Alejandro Corrado in the year 1883, that is, a short time after the Chiriguano lost their independence because of the whites and the Chané began to become emancipated from their oppressors, forming their own towns, somatic differences between the

166 towns from which one man had come from each one. From Charagua, Parapití, and Carapati two had come from each one, four from Ingre, five from Santa Rosa, and eight from Machareti. Unfortunately, the native soil of the Chiriguano women was not stated, and it is only said that they came from Bolivia.

141 The average height of the Chiriguano men measured by Lehmann-Nitsche is 163.4 cm., and the height of the Chiriguano women measured is 151.7 cm. This average height of the women measured is not a little less. The average height of the eight men from Machareti was only 161.8 cm., and that of the two men from Parapití only 158.1 cm. But the average height of the four men from Ingre was 169.15 cm. The tallest of the Chiriguano men measured, who had a height of 178.6 cm., had come from Ingre, and the shortest, with a height of 153.5 cm., from Machareti. The smallest woman (between 35 and 40 years old) was only 143.0 cm., and the tallest, 158.0 cm. These numbers show us that the height of different Chiriguano individuals is quite variable. Among the Chiriguano measured by Lehmann-Nitsche, the number of those who came from the same region is too small to be able to make exact deductions about the differences in height of the Chiriguano of the various regions in order to be able to clearly demonstrate the somatic influence of mixture with other tribes.

14 The photographs of Chiriguano types published by Lehmann-Nitsche show great variations among the different features and bodies, which corresponds to the fact that the present-day Chiriguano are the product of a mixture of various ethnic elements.

113 114 142 Good photographs of the Chiriguano of the southern part of their territory can be found in the publication of von Rosen, Ethnographical Research Work during the Swedish Chaco-Cordillera Expedition, 1901-1902 (48). Erland von Nordenskiöld

48. Stockholm. 1924.

The Territory of the Chiriguano

C
131 Concerning the location and extent of the territory of the Chiriguano at the time of their independence, that is, from the beginning of the 16th century to the second half of the 19th century, we have Moreno's detailed studies in two places in his work already cited many times above, the titles of which are: "Las tierras de los Chiriguanos /The lands of
C [101] the Chiriguano/" (50). According to Moreno (51), the

50. Moreno II, pp. 79-126 and pp. 235-254.

51. Moreno II, p. 236.

Chiriguano--Chiriguano /14/ of the Cordillera in contrast to the Itatines-Guarayus and the Piritaguaris also often called Chiriguano in the literature -- from the time of the Conquest until they lost their independence inhabited the same territory, that is, the western spurs of the Andes from south of the Pilcomayo up to the lands which extend on both sides of the
Ce Guapay. The Chané, who formerly had a large well-populated
13 territory, "although they formed several partial migrations,
[648] remained in great number subject to the conquering Guaraní within the region which these latter had converted into their impregnable abode" (52). In 1883 Father Alejandro Corrado

p. 171 and Map 21). Their baskets being in bad shape, the Guarayú wanted to make some new ones and were very annoyed not to find in the region into which they had come the palm trees with pinnate leaves which they were in the habit of using for this purpose. Now, Guarayú and Chiriguano are brothers in race and language and emigrated at the same period from Paraguay to settle in the vicinity of the Andes. When leaving their country of origin, both were acquainted with this type of basket used by their ancestors, the Guaraní, the Tupinamba of the Brazilian coast, /440/ and still favored among their first cousins from Paraguay, the Kainguá (Métraux, 2, p. 206). The disappearance of this cultural element among the Chiriguano is due solely to the lack of appropriate raw materials.

C G4 285 482 174 824 [144] [197]

C 177 482 In order to make up for the absence of back baskets, indispensable to a farming people /Fig. 98 appears here/ the Chiriguano borrowed from their neighbors in the Chaco, either the Mataco or the Choroti, the carrying nets (in Chiriguano: añapoka) whose use is so widespread among the latter and is so characteristic of their civilization. Carrying nets today are in general use among the Chiriguano, and in every village each family has at /Fig. 99 appears here/ least one (Figs. 98 and 99). In spite of this wide diffusion, the Chiriguano añapoka betrays its origin by its form and technique (see Figs. 100 and 101 /see pp. 283 -285/), which are both found in the tribes we have just enumerated (Nordenskiöld, 9, p. 208, Technique I). Although considerably more advanced on the way to civilization than the seminomadic tribes of the Chaco, the Chiriguano do not by any means equal them /441/ in the art of making nets. The añapoka I collected cannot be compared with the deep bags which the Matako or the Choroti, for example, make for the same purpose. In the village of Machareti, where Toba live with Chiriguano, it is the former who furnish the latter with the /Fig. 100 appears here/ carrying nets they need (see Fig. 99 /see p.282/) (1).

/110 cont./

144 Some explorers and travelers, after having happily concluded their investigative labors, have set down in their reports that the Chiriguano Indians have changed greatly in physique since the whites or Creoles entered their territory, but nothing could be less exact than this. Clandestine unions between Christian men and Chiriguano women have been quite rare, and even rarer are legitimate unions through Catholic marriage, from which generally comes propagation and change in races (2).

[563] [799] [799]

> 2. In 20 years of missionary life I have blessed but four marriages between Christian white men and Chiriguano neophytes.

114 144 If Señor del Campano states that for a period of 40 years the Chiriguano have maintained themselves without change, on the basis of photographs taken in the year 1860, which were placed at his disposal by Professor Mantegazza, and those which the missionaries of Potosí and Tarija sent in 1898 to the Turin Exposition, among /111/ which was a skull collected by the author of this work in the fields of Curuyuqui and sold by Father Giannecchini to the Florence museum, what can be said by some missionaries who have grown old and who are growing old among these Indians and who know the race in old men and in young boys, in old women and in damsels, before and after the white Christians were introduced in number?

In my judgment the said change does not exist, because an occasional isolated case, an occasional family, where the mixture of the two races has taken place, cannot be adduced as proof that the physique of the race has varied greatly. Travelers and explorers pass through a region rapidly; they can devote little time to the study of a race, and consequently their written reports, worthy of all respect, are somewhat exaggerated, as were those of the Spaniards

/111 cont./

•144 114 [113] who conquered Mexico and Peru (1).

1. Guillermo Robertson. Historia de América desde el descubrimiento hasta antes de la Independencia /History of America from the Discovery to before Independence/. Travelers exaggerate their stories in order to attract more attention.

144 [191] [142] There are extensive areas where mixture of the two races was frequent, but it must be pointed out that in these areas the children of such have ceased to be Chiriguano, both because of the Spanish language, which they now speak perfectly, and the color, which is completely different: it is no longer parchment, as Father Corrado states, but a skin which is up to a certain point fine and velvetlike, so that for this class of persons who descend from white and Chiriguano the appropriate name is mestizo and not Chiriguano, and consequently the physical characteristics of the race have not changed. In these same areas families which have kept pure Chiriguano blood are not rare, and these families, or the individuals which make them up, have the same characteristics as other Chiriguano, without any noteworthy difference (?).

2. From the left bank of the Parapiti River northward this radical change is taking place, making the race disappear.

On the contrary, in the great Chiriguano centers, such as all the missions and a few other areas outside of them, 141 the physique of the native has not changed at all. As a 142 rule their stature does not reach one meter and 70 centimeters in men, and rare are the women who reach 1.60; the hair is black, glossy, and coarse, and very vigorous in

From the preceding historical sketch it can be seen that the ethnic entity "Chiriguano-Chané," with regard to its physical characteristics, is made up of an ethnic mixture of absolutely heterogeneous elements. We have told how the Chiriguano for centuries captured many prisoners, incorporating them into their community, and how at the end of the 16th century the number of Chané incorporated among them was much larger than that of the pure Guaraní-Chiriguano. Although the Chané, belonging to the linguistic group of the Arauca /Arawak/, were a peaceful nation and were not equal in strength to the pure Chiriguano, their culture, which for a long time was in contact with that of the ancient Peruvians, was doubtless superior to that of their oppressors, and the Chané women surely had considerable influence on their masters. Since the two population elements lived together for three and a half centuries, we must suppose that they would have mixed extensively.

C
142
M5

Unfortunately, the ancient documents say very little about the physical qualities of the Chiriguano. The only brief note on this subject that I know of is found in the "Descripción y población de las Indias" by Bishop Lizarraga (44): "They are

44. Moreno II, p. 101.

comely, robust, with broad-shouldered, high chests, well built, dark. They pluck their eyebrows and eyelashes; the eyes are small and lively." According to Father Alejandro Corrado in the year 1883, that is, a short time after the Chiriguano lost their independence because of the whites and the Chané began to become emancipated from their oppressors, forming their own towns, somatic differences between the

/12 cont./

C 149 [177]

Chiriguano and Chané no longer exist. "The physiognomy of the latter was completely identical to that of the former" (45).

C 114 141 [113]

In addition to anthropological measurements made on four Chiriguano by Ten Kate (46), Robert Lehmann-Nitsche

46. Ten Kate. Herm.: "Matériaux pour servir à l'anthropologie des indiens de la République Argentine /Materials for use for the anthropology of the Indians of the Argentine Republic/." Revista del Museo de la Plata. Vol. 12. La Plata. 1904.

in 1906 had the opportunity at the San Pedro de Jujui sugar mill to take the anthropological measurements of 40 Chiriguano men and ten women, who had come from Bolivia to work at that mill. Entitled "Estudios antropológicos sobre los Chiriguanos. /Pl. III-IV appear here/ /13/ Choroteo, Matacos, y Tobas (Chaco Occidental)" (47), Lehmann-Nitsche has

C [113]

47. Anales del Museo de La Plata. Vol. I. No. 2. (Second Series). Buenos Aires. 1908.

published the results of these measurements, together with measurements of other Indians, and added to that publication in the first 12 plates Chiriguano types photographed by Carlos Bruch. In addition to the somatic measurements, determination of skin color, eye color, and hair color and form have been published by Lehmann-Nitsche. Thirty-six of the 40 Chiriguano men stated where they had lived, and from this we know that these people had come from various regions of Chiriguano territory to the San Pedro sugar mill. There were some who had come from the northern regions, and one had come from the city of Santa Cruz de la Sierra. Others had come from the south of Chiriguano territory, for example, from the town of Carapati, located considerably to the south of the Pilcomayo River. There are named 13 Chiriguano

C 166

C [167]

[TEXT CONTINUES ON P. 30]

/13 cont./

132 atmosphere immediately cools down and there begins a cold wind whose chill is increased as it passes through the region of hail, and since the maize stalks are still tender they are easily stricken. The hail that falls is big, the earth is churned up, and it kills birds, sheep, goats, and other animals, if they are unable to hide in the bushes or under thick trees, but this does not happen often nor every year.

[133] Earthquakes are most rare; I felt them twice during my stay in the region, in 1899 and 1909, but the wind is sometimes so strong that it seems to make the earth tremble; there is no doubt but that it tears up trees and strips them, ruins buildings, and dismantles tiled roofs. Foreigners in this [145] so hot and changeable climate soon age and turn gray, but the natives who are used to it from childhood, despite the vices of drinking and others to which they surrender, enjoy a relatively long and healthy life.

It can readily be understood from what has been said that here the seasons of the year follow a different order from that which is seen in the Old World. Despite the fact, then, that there are no more than two seasons, we always can and ought to consider the four, in order to follow the general rule of the universe which divides the year into four parts. Summer begins December 21, fall March 21, winter June 21, and spring September 21, but all of these come ahead of time, as anyone who has lived here can testify.

Fertility

133 182 311 312 361 The Aguaragüe range, which is found to the east and one league from the Mission of San Buenaventura de Yvu, is the last one in Chiriguano territory. Small towns and families of these Indians are scattered here and there are still found east of the said range some 15 leagues away, but beyond that /14/ there are none because the area is arid and dry, "igũ utini vae," as they say, and the Chiriguano accustomed to planting maize, beans, and gourds cannot live where there is a scarcity of rain for his crops and water for his daily bath.

/112 cont./

142 The Chiriguano at the time of birth has a color which is difficult to define, but, and let nobody laugh at this, his color is that of newborn mice, and as he grows the color changes until it is that of sunburnt parchment. The causes [147] of this change are the tropical heat, the sudden winds and changes, and the burning sun, to the action of which they expose themselves with untoward pleasure, with no bother and without fear, even should they be but tender infants.

441 147 From this it can easily be deduced that the Indian does not fear the canicular sun, or heat either; he works on the hottest days without shirt, trousers, or anything which re- [291] sembles these; he stretches out full length, very content, [516] receiving on his back the rays of the firey sun, and nothing daunts him. But when the north wind changes to the south and consequently the cold begins and the frost comes, he is very cowardly, and it is hard to make him work well and happily; in such cases it is easier to suspend the work for a few days, not to pay the laborers anything at all, and not to get uselessly angry; but this can only be done when the suspension does not have any bad effects (2). /Illustration appears here./

2. It is not only the Chiriguano Indian who hates the cold, but also the other races of America, such as, for example, the Quichua /Quechua/, according to what the historian Robertson says.

165 /113/ Life Span

The Chiriguano normally lives a good many years; he is little affected by heat, cold, and the inconstancy of the climate, nor by drunkenness and self-indulgence, to which capital vices he abandons himself from a tender age. Some [145] reach and pass 100 years, judging their longevity by their hair, since their hair does not turn white except at a very

[Text Continues on P. 156]

/113 cont./

165 advanced age, and I have seen Indians with the head com-
[145] pletely white, and others with a white the color of smoke or something smoked. In the performance of my ministry I have met and baptized many centenarians at the time of their death, and in the towns through which I have passed I have met several who fought in the Caparari war and who witnessed the War of Independence.

273 But today the Chiriguano has degenerated greatly; in
276 somewhat distant times they did not know about either liquor
[178] or coca, and today both are general, and because of liquor and coca, the use of which they much abuse, they ruin their health and shorten their existence. Much youth disappears with the abuse of these substances, and as a general rule in the missions the best disappear, those who know some art or have some fortune; all that they earn, after buying their clothing (although not always), they invest in liquor and coca, and
[165] thus shorten their lives. I have seen towns where out of 40 or
[648] 50 young men of the same age there are scarcely two or three alive who will reach 50; it can thus be seen that the drunkenness produced by chicha is not so pernicious as that of liquor or alcohol, for which any tax imposed on them by the Supreme Government is never too much, and would that such a tax were higher, more general, and that it was not felt to be enough simply to write it out. In spite of this dissipated life, it is
[142] very rare that one encounters a bald Indian, which indicates
[147] great robustness (1).

1. I have known many large and small Chiriguano towns; I have only found three semibald persons.

Morality

181 At present the Chiriguano Indian differs slightly or not at all morally from the common mass of men. I mean that not all are good nor are all perverse; there are good ones and bad ones

C /215 cont./
165 President Belzu in Sucre. The latter governed between 1848-1855; thus, 100-year-old Maringay is obviously not more than about 80. An 80-year-old Indian is therefore the oldest of his tribe.
C
145 Among the Indians one almost always sees /Fig. 112 appears here/ that the one who has grown-up grandchildren is very frail and senile and stands at the brink of the grave. Indian men and women
e mature very rapidly, but also age quickly. At 50 the Indian is an
[114] old man, at 70 a so-called centenarian. Im Thurn (1) likewise

1. Im Thurn, op. cit., p. 190.

believes that the Indians do not grow old. /216/ He thinks that
C they seldom reach an age older than 40 or 50.
142 Maringay's hair was slightly gray. There are some Indian
C men and women whose hair is almost whitish yellow, but they are
[145] rare (Fig. 112). I never saw a bald Indian. When they are older,
[64] their faces are deeply furrowed. Not infrequently they become blind in old age, less often deaf.
Ee Among the Choroti and Ashluslay the appearance of old
142 people is often frightening; they are dirty, emaciated, and
515 bleary-eyed. This is not the case among the Chané and Chiriguano. These Indians know how to grow old in beauty, and even the old people keep themselves nice and clean.
Ee If the Chané or Chiriguano Indian becomes seriously ill,
756 the medicine man is sent for, as among other Indians.

The Chiriguano and Chané distinguish between two kinds of medicine men, whom they call "ipáye" or "ipáyepótchi." The
Ee former are good and lift the spell; the latter are able to lift the
[754] spell and to bewitch.
C I once jokingly asked a Chiriguano whether Father
756 Bernardino in Ivu was an "ipáye" or an "ipáyepótchi." The Indian
797 answered dutifully, an "ipáye." The position of the missionary among the Indians is that of medicine man; he assumes their power and
C their influence.
Ee In the preceding I said that the whites in the vicinity of
756 Ivu sent for an Indian medicine man to drive away smallpox.
177

/111 cont./

141 both men and women, and fair hair indicates either an
142 oddity or a clandestine affair. The forehead is rather small, as are also the languid, downcast eyes; the face is round, the nose flat, the mouth wide, the denture white as ivory, the chin short, and the lips rather thick. /112/ The
142 men do not wear beards, and anyone would believe that they
302 are beardless, but the main reason why they do not have one is that they pull out the hairs as they grow, and for this they have some tin tweezers with which they make all the hair disappear, and they do well, because otherwise, in view of their slovenliness, with long beards they would really be orangutans (1).

[186] 1. The Toba call the Chiriguano tigre face because of his round face, and the latter gets back at them by calling them horse face because of their long faces. In the missions the neophytes wear mustache and goatee.

141 They have a chest thrust forward, rather heavy
[291] shoulders and arms, normal-sized hands, and not very big feet, in spite of the fact that they grow as they will since they always go barefoot, especially the women, and not
● 147 all of them wear sandals /ojotas/. When they are enjoy-
[853] ing good health, they are very robust, and the women without the slightest bother will nurse two babes at their
[609] breasts. Whenever some white Christian woman is not able to nurse, she usually seeks out a Chiriguano woman to wet-nurse her child; this, in addition to being very advantageous because of the goodness of the blood, is also quite eco-
855 nomical. But it is true that most Indian women do not
[609] wish to take care of children other than their own; most
[466] of the time they agree to it with reluctance, or by force, this last occurring when the Indians are subject to a master.

/112 cont./

142 The Chiriguano at the time of birth has a color which is difficult to define, but, and let nobody laugh at this, his color is that of newborn mice, and as he grows the color changes until it is that of sunburnt parchment. The causes [147] of this change are the tropical heat, the sudden winds and changes, and the burning sun, to the action of which they expose themselves with untoward pleasure, with no bother and without fear, even should they be but tender infants.

441 147 From this it can easily be deduced that the Indian does not fear the canicular sun, or heat either; he works on the hottest days without shirt, trousers, or anything which re- [291] sembles these; he stretches out full length, very content, [516] receiving on his back the rays of the firey sun, and nothing daunts him. 181 At present the Chiriguano Indian differs slightly or not at all morally from the common mass of men. I mean that not all are good nor are all perverse; there are good ones and bad ones

/210 cont./

Infant Care

854 [352] For the newborn child to rest in, they have a kind of net which they hang at one end of the lodging. Its mother places it there when it sleeps, and she covers it with a piece of cloth so that the flies will not bother it. Some wool or cotton hammocks are crudely made /211/ by them, and these are called Ini ó quiha, the last term of which literally means quietness.

The mother almost never leaves her newborn child, and to go to the spring or to the river she takes advantage of the time when it is asleep, leaving it in the care of some person, even a little one. She cannot yet carry it in the folds of her clothing, because the child's tender limbs cannot bear such a position. Only when they have become somewhat stronger does the mother walk from one end of the town to the other, to the field, to the spring, without leaving her child at home, like weasels or like the kangaroos of Australia, who do not leave their young in the caves when they go out, making leaps like a jerboa.

147 854 The sun in the Chiriguano region is very hot and yet children exposed to its action do not feel its effects very much, if at all. They receive its rays perpendicularly, from in front, from all sides, and square on their faces, and it is as though they were in the shade. The only effect that it has on them is the copper color of the race, because experience has shown that this color is acquired (1).

142 1. The color of the newborn babies is rather strange; they look like mice. Many newborn babies are completely white, but not like Europeans; the difference between the former and the latter can be seen immediately.

Love for the Home

574 152 When someone has been away from his town for a long time and returns, he is received with much love. He enters his house without saying a word, and if he arrives at night, to the question of "Who is it?" he merely answers "Checo," it's me, and then those in the house begin to cry or give shrieks of joy which may last for five minutes, and soon they give him something to eat and the [114] questions and answers begin. I witnessed this without being seen one night in Parapiti at the San Antonio Mission.

152 591 167 186 It is not rare that once in a while a smaller or greater proportion of Indians temporarily leave their town, either because of scarcity or in order to avoid the anger or ill will of the cacique. They then go away with considerable unhappiness, and they go into exile like Hagar /122/ with her son Ishmael when they were ordered out by the patriarch Abraham. They cry as they leave, they cry along the way, they cry upon arriving in the land that receives them, where, in spite of the good reception which has been prepared for them by other people, they do not find peace, and they always sigh for their home.

When they decide that in their former dwelling place things may have changed, or that the cacique who is responsible for their misfortune and exile may have disappeared from among the living, they return (1). In Yvu, where

1. The Indian Cayuguari, because of a crime committed in Machareti, fled with a group of Indian friends and relatives, settled quite far away to the northeast of Carandaiti, and, as the cacique whom he offended is still alive and as furthermore Cayuguari began a life of cattle rustling, he never returned to his town.

the war of Curuyuqui (1892) occurred when the San Buenaventura Mission was founded, all those Indians who had taken part in the uprising were wandering about in

/122 cont./

152 other towns, and they returned almost en masse, and the first
591 thing they did when they once again trod the soil of their home-
167 land was to cry. I witnessed the arrival of a cacique with
186 his large family. Men and women came loaded with their household goods and children. They arrived in poor condition, covered with dust and sweat (it was at the end of December), tired and sad, and when they saw their fellow countrymen and relatives happy and content under the paternal rule of the Catholic missionary, they put their burdens down on the ground, in the houses of others, and then there broke out the tears and the wails, thus arousing the consternation of all the inhabitants and the missionary (2).

2. Father Corrado relates an analogous case in his Historia de las Misiones de Tarija.

Poor unfortunates! In spite of the vices which dominate their corrupt nature, there is something noble in the Chiriguano race. Their fondness for their native place, for their home, is great. They will make any sacrifice to return and prefer to die of hunger and thirst. They will never abandon their town and their home, unless constrained by necessity, fear, or persecution.

Along the road from Yvu to Parapiti there is a town called Itatiqui, where not even drinking water can be found in the vicinity. Want is eternal there; the crops are miserable there; and they either beg for water or steal it from the lakes which are more than five kilometers from the town. Some six years ago there were about 120 families there, persecuted by some whites to whom they did not wish to be subjected. I tried to take them away to form a part of San Antonio Mission, but it was impossible to move them from the place.

They prefer to suffer hunger, thirst, vexations, and persecu-
799 tions there, but they do not abandon the place. They would re-
829 main there very happily /123/ if a small mission were built for
177 them, as they desire, which is somewhat difficult, considering the special circumstances of the place, since the civil and

/133 cont./

776 finally, the caciques, tired of being oppressed in certain areas by
173 certain bad Christians, have called some unfortunate, but alert
792 and bright boy Tunpa, in order to gather Indians from other areas to hear a flesh and blood God and fight with courage in the holy war (2).

000

2. The Mexicans, at the time they were conquered by Hernán Cortes, had temples and idols, with priests serving them. When they beat on the holy drum, the fury of the warriors was kindled. In one battle Cortes lost 60 Spaniards, who were burned before the idols.

776 In this last case the illustrious Missionary Father Angélico
173 /134/ Martarelli, in his appendix to the history of the missions
792 says in substance the following: "The boy whom the caciques
791 chose to deceive the rest assumed the name of Tunpa so that his oracles would be believed and respected with great reverence. He was shut up in a hut and from there, through his counselors (one of whom is still alive and very attached to the missionary), gave answers to those who asked, Indian or white. These must respect his advice with all humility, and they were damned if they declared themselves unbelievers, while those who were good joined the ranks behind his flag.

Beliefs in the Spirits

• 152 It is not unusual for someone who is passing through Chiriguano towns to hear, either near or far, a man or a woman, or some-
[195] times many people, crying, especially at night. In this last case it causes sadness and who knows what terror for white hearers or for missionaries, because these wails sound like those of condemned
775 souls, and it seems as if they are crying about their misfortunes and the loss of eternal blessings.

/270 cont./

times in different locations (1).

1. At the carnival, during the three days, there are women who dress like men and men who dress like women, but both cover their faces well so as not to be recognized; this was also taught them by the white man.

[152] On the second circuit all the Agüeros, the masked ones, a mestizo term, ask from house to house for provisions, and they accept everything, even bean pods and watermelon rinds, and on the third circuit, which is the farewell, there begins the wailing of big and small masked persons, laden with provisions and scraps; these weepers really make the old people and others cry, because some of them are thinking of their departed ones who are not present at this festivity which is ending, and others perhaps because they think they will not get to see another carnival. I questioned an old man who was really crying, and he gave me the preceding answer. When the last circuit ends with the drums muffled as a sign of sorrow, all of them, riders, dancers, and agüeros, go out of the town and go to a place where they throw away the masks and immediately go to the river, or a spring, to wash their hands and faces a little (2).

535
541
177

2. All of the foregoing games in Ivu were taught them by the same white man whom I have mentioned, and in the beginning he taught them by demonstration, causing astonishment, particularly in the women and the old persons; many of the said games are immoral, especially the circles and the massed group.

796
177

Easter

Forty days later the Chiriguano has another fiesta, that of the Pascua de Resurrección /Easter/, which was introduced by the whites; the old Indians call it nice because it is quiet, as they call the carnival very noisy.

/3 cont./

133 The Indian makes full use of the valleys, laying out his
132 field with its own fence; his cow also grazes there, with her
311 calf running and playing across the level ground, and the wild animals live everywhere there, the dauntless foxes, the inoffensive anteaters, and the timid little deer /*cervulus*/, while the monkeys seek the woods and the brambly, craggy ground of the hills to entertain themselves in raucous clamor, and the condors love to soar through the air to an extraordinary height, even considering that they launch themselves from the peaks of the highest hills.

133 While the ridges run from north to south, the course of the rivers is quite capricious: they run to the north, regress southward, direct themselves eastward, advance intrepidly westward, but the dominant course of them all as far as the pampas of the Gran Chaco is from west to east, overcoming every difficulty set in their way by the ridges, from which they leap with an extraordinary din, such as at the "*Pirapo*" (cataract of the fishes) or the waterfalls of the Pilcomayo and Parapiti rivers.

In the land of the Chiriguano, torrents and streams abound; more numerous are the rivulets which quickly lose their waters because within a few kilometers they run into endless sandy areas. If the hidden water should fail to appear occasionally in the ravines, which are small arroyos in origin, life here would be all but impossible, since places like Tva, which without having a river or anything similar, possess abundant and excellent water, are numbered. The springs which appear in the beds
312 [157] of the torrents are of the greatest benefit in those places where there are no lakes or ponds, for the Indian, because of his laziness, is not capable of building artificial lakes for his water
[164] supply. In Batiqui, for instance, not long ago there was a group of some 150 Chiriguano families; they could have made a lake in order to have such a necessity, but neither did they do it nor will they on their own initiative, and they go five kilometers to get it or at least there is the Chiriguano woman with her jug waiting for the forming of the drops which exude from the western slope, from which comes the name "*Batiqui*," the stone that drips.

151
151
151
[133]

The banks of the Pilcomayo are difficult for the opening of canals because they are quite high, but it must also be admitted that the Indians do not concern themselves with progress, are not ambitious like the whites who have settled on its banks; the latter also, because of being few, poor, and of limited means, almost all prefer to get rich with little work and little outlay of money, for which reason they devote themselves to raising cattle and hogs, which thrive without much care or expense.

133 The Paraguay is the second river named; it contains less water than the first and in Fuerabamba, where it begins, it is very insignificant, but ten leagues farther, or after it has crossed Curi Ridge, it already begins to be respectable, and in front of the town of San Juan del Piray it appears as a ferocious beast ready to do battle with a weaker adversary, like the Armado River, whose waters it stops or makes recede, just as a lackey halts in the presence and at the sight of his master.

This river runs from west to east with few digressions as far as Mariqui in Parapiti Canon, whence it goes north and from its beginning it crosses the central part of Chiriguano country. In San Juan del Piray the river is some 12 leagues from the Pilcomayo; both rivers could easily be joined to make them one, for which there was once a project, but it would cause much harm to agriculture, especially in Cordillera Province, and the Pilcomayo would have the slight advantage of an increase in flow which would perhaps make it navigable from Villamontes to the Encon.

In San Juan del Piray the Parapiti River receives as tributaries the Armado and the Piray rivers, and beyond San Pablo de Huacareta the waters of the river of Sauces and several others join it. Thus the Parapiti is a river of some consideration, and its bed is very dangerous at nearly every crossing because of the absolute lack of stone, especially from the Missions of San Antonio and San Francisco to Iman Canon.

/15 cont./

433 241 sweet potatoes; cotton grows everywhere, tomatoes and garlic mature the year round, and in the gardens lettuce, cabbage, cauliflower, and peppers create the beauty of a spot, without taking into account the gastronomic advantages. Even the peach trees would yield fine fruits, but they suffer much from the black butterflies, which damage them before they ripen.

Without work the land will produce only brian and brambles, and /16/ as long as there are only Chiriguano and cattle ranches here, progress will be slight and the population sparse, because the Indian has no ambition, and life is relatively inexpensive; the whites prosper by taking good care of their livestock, and no greater fertility can be obtained from the land because the holdings of a few families are very extensive and do not facilitate the residence of numerous renters, who do not always give good results nor do all come or ask to rent for farming alone. All of them want to get rich easily and quickly, and the best way is to raise stock, the result of which is that great areas of brian and brambles exist.

[35] [36] [35]

Flora

13 In the course of this hasty description I have noted that in Chiriguano country atmospheric changes are very sudden, but it has been noted that the region is quite fertile when it is watered by the rains or by irrigation ditches, because small rivers are plentiful, particularly in the mountainous region, and an occasional river of some size bathes the adjacent territories with its abundant waters.

There are many hills, pampas, and valleys, and for this reason every kind of climate may be found in this territory. [37] There are in fact oppressive heat, intense cold, and a temperate climate, thus making it possible to find land for every product from the lowly gourd to the savory chirimoya, from the ubiquitous maize to wheat, rice, and barley, from the mulberry /mora/, which grows spontaneously, to the rich grape, whose bunches reach weights of three and four libras.

648 /115 cont./
178 obtain the participation of his people when some work of public utility is ordered.

157 Dominant among the Chiriguano are idleness, incon-
181 stancy, intemperance, thievery, infanticide, abortion, and even
[847] suicide, which is generally committed by the women. They
[762] only work when it is necessary and when they are overcome
[461] by want; then they will sweat in order to eat, and then with all humility they appear at the house of a Christian and deliver themselves into his charge with the whole family.
[186] But if near the carai /sic; see caray, p. 157/, they find another of their own race who might favor them, even though it be disadvantageous, they do it, because they abhor the one whom they consider the author of their misfortunes or of their captivity. Therefore whenever they speak of the carai, they append the adjective pochi, bad, perverse, tyrannical, rascally, etc.

[533] They learn very easily everything that is taught them, especially music, for which they seem to have been born, but their fickleness ruins it all; they are not set in their ideas nor do they worry much about any loss, even that of
[273] their honor. Temperance is not even known by name, and drunkenness is glory, and for that reason in years of plenty, there are continual orgies in their towns. Thievery and
[178] cattle-stealing are relatively recent; they were not com-
[674] mon formerly, and the cause is probably that of bad example. In certain areas young cattle disappear from sight, and they are so united that the facts are not easily uncovered. Only after /116/ some time has passed or because of enmity will some fact come to light (1).

[648] 1. In their peaceful denunciations they urge
[685] great secrecy so that the authorities will not
[754] make public their names, out of fear that the person informed upon may take revenge with the use of poison or witchcraft, and, if the crime is not proven, the authorities can do more than reprimand and admonish.

/123 cont./

Aptitudes

461 It cannot be denied that laziness is innate in the
•157 Chiriguano Indian, but, when compared with the Toba, Mataco, and other tribes, I assert that they do a great deal or even too much. They need a guide, they need to be watched over, but when this is not lacking, they are hard working. The whites
464 in the regions inhabited by these Indians do not know of any other laborers. All the towns of Cordillera, Azero, and Gran Chaco have been built with the energies of the Chiriguano. With these same laborers are sustained the agriculture and cattle raising of these provinces, and even by means of them are the national roads of these regions kept clean and open, as well as those from one canton to another, the one from Yacuiba to Santa Cruz and the one from Taperilla. The Chiriguano laborers began and are continuing the work on the Azero bridge, /124/ and many of them are still working on the Bermejo River close to where it arrives at Yacuiba (1).

1. A private enterprise composed of Don Braulio Zapata, corregidor of Carandaiti, the subprefect, Don Ramón Menduiña, and other well-known and rich men of the same town is organizing an expedition to the fields of Cayuguari to found a fort there and to conquer the territory. The subprefect plans to open a cart road, with the help of the Chiriguano cacique, Mandepónai, and his soldiers.

797 The paternal rule of the missionaries has managed to make the Chiriquano much more docile; it has succeeded in building towns and large centers of population around the Cross; there is not one of the towns of those who live in complete ignorance of Religion that can be compared with them. The Missionaries have succeeded in building magnificent churches, great teaching establishments, comfortable and airy houses, workshops for arts and crafts. They have managed to implant the teaching of

/124 cont./

797 Religion, that of reading and writing, and even the art of musical chords, which is only seen in the great centers of the world (2).

[533] 2. In the Potosí missions there are four music bands, and in those of Tarija, two.

The history of the Tarija missions is glorious in all of its pages. The reader can consult, whenever he wishes, the one of the Colegio of Potosí in its two epochs as well. This will cast a brilliant light upon the matter, and the traveler can say nothing to contradict it when, ecstatically, he contemplates the grandiose, strong, and well-planned edifice of the Santa Rosa Mission, that of the elevated Machareti Mission, that of the old or semisecular Tarairi Mission, and the one which, as though by enchantment and with order, is being built in the mission of San Antonio del Parapiti Grande.

797 All of this shows that the Chiriguano, in spite of his
●157 indolence, is docile, and with gentleness and a little strictness
177 at the same time he will do whatever the white and the missionary wish him to do. It finally demonstrates that, though he does have his vices and defects, certain human virtues are not lacking. It shows that it is necessary to educate his nature by teaching, with civilization, as the carpenter with his plane smooths a piece of wood if he wants to make the job elegant, or a blacksmith with his file smooths the rough iron until he has made a key, a lock, or any other object.

/125/ Philanthropy

577 To end this third chapter and then pass on to deal with
829 Chiriguano religion, I am going to say in passing that they are very compassionate with the unfortunate. If one of them suffers the harshness of imprisonment, they all make every effort to ask that he be freed and will even sacrifice whatever they may
[136] have to obtain it. If someone is sick, he is visited by many; if one is left an orphan, all are his fathers, mothers, grandparents, and brothers and sisters, or at least they are his uncles and aunts or brothers-in-law and sisters-in-law.

/159 cont./

In the village of Cuevo alone 60 out of 200 persons died within a short time. I visited the 140. They were as gay as ever. Spirits and beer were consumed in quantities. 114 164 [65] [273]

Father Bernardino was never given credit for this work, but rather the medicine men, who had bewitched the sickness so that it would not come to Ivu. The white colonists, too, occasionally had the medicine men come in order to /Fig. 78 appears here/ drive away the sickness. They did not believe in the vaccine either. 797 756

With Ivu as the starting point, I made a trip into the 114

415 531

Fig. 77. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/6.

Igüembe valley, in order to visit the Chiriguano chief Maringay. 114 It was a charming ride on horseback up on the high crests and down into deep valleys, through an often grandiose, colorful landscape. These valleys are poor in forests. Only in a well-protected ravine in which a brook trickles forth is the vegetation luxuriant. [133] [137]

I soon became very good friends with old Maringay. The old man was conservative, clung to the old customs, and felt that the Indians should be on good terms with the whites, but should preserve their old habits and customs unchanged. His village was extraordinarily interesting and very rich in old, fine things. 123 157 178 643 000

/4 cont./

131 Thus formerly the Chiriguano territory in the north was contiguous with the province of Sara, in the south and southwest with Argentina and the city of Tarija, in the west with Tarabuco country, and in the east with the colony of Carandaiti. According to its former boundaries, it then included an area of 200 leagues from north to south and southwest, and more than 90 leagues west to east.

131 Today this extensive territory has been much reduced be-
• 16 cause of emigration, caused in part by the whites, under
[648] whose dominion most of them will not resign themselves to staying; the plagues which decimate the race have a powerful influence on its further reduction, and very soon /5/ barely the
131 name will remain. Today to the north it scarcely reaches Abapó, to the south, Itiyuru de Yacuiba, to the west, Monteagudo, and to the east, Carandaiti, some hundred leagues from north to south and about 40 from west to east.

131 Formerly it embraced several degrees of latitude and three
648 and a half of longitude; as they lost a considerable part of this
[433] area, so will they end up by losing it all, for despite their being heirs to the country which God had given them, as one of them was saying to me not long ago, they do not know how to farm it and improve their agriculture; they prefer to go far away and work for others rather than to own land at home. This very day only a few leagues remain in the hands of the Indians, Caipipendi in the province of Cordillera, Gutierrez Canton, and all the territory occupied by the missions, but both are likely to pass into foreign hands, because in fact the Indian is incapable of making the land that he does possess bear fruit; then the few survivors in the territory will be servants in their own house, as are so many others in lands that were once their own.

311 The land is very unstable, at least that now occupied;
134 it lacks stone and gravel, and since in their season the rains
[132] are torrential, they easily open cracks which in a few years become wide, deep ravines. Contributing a great deal to this are the cattle, which, because of their weight, stir up the land with their hoofs more than other livestock; for this reason

/330 cont./

Cg 177 The Chiriguano adopted this civilization of a superior type with all the more ease by reason of the numerous affinities it offered with their own. The whole Amazonian and Guianan side of the Chané civilization was composed of industries, techniques, and practices with which the Chiriguano, having come from the tropical regions of America, from a country of great forests and rivers, were already acquainted in part. Thus, for example, the Guarani, upon arriving among the Chané, found again the hammocks, grain sieves, mortars, baskets, and weapons to which they were accustomed.

Cg Ce 177 Ce [323] The contribution of the Chané consisted of the very cultural elements they had received from the Andean peoples, that is, clothing (camisetas, headband, etc.), the liking for silver ornaments, some artistic motifs, certain pottery forms, etc., things which were scarcely beginning to filter into Paraguay. The influence of the Chané was decisive in the sphere of pottery.

Cg 177 563 323 [161] Ce 178 323 177 The civilizing action of the Chané upon the Chiriguano had as agent the Chané women whom the Chiriguano captured and married. The Guarani had certainly taken along with them only a small number of girls. They themselves were few in number at the beginning, 4,000 according to Lizárraga (Vol. I, p. 260). In uniting with the Chané women whom they carried off by the thousands, they renewed with their blood all the feminine aspects of their industry. It is the women, for example, who make /331/ the pottery; a man would not be able to engage in it without losing prestige. So we see the pottery of the Guarani undergo important modifications and change completely. Today pottery is their glory; and of their ancient ceramics they have kept only the humble pots or the brewing vats for chicha. In spite of their decline the Chané have maintained their traditional superiority in this art, and they continue to produce vessels which, if they are not comparable to those of the past, are often very beautiful.

175 /332 cont./ Permanent
[3] villages were there under the command of hereditary caciques.
[361] The middle course of the Parapití formed their boundary to
[621] the east. In the 18th century the Chiriguano constituted the most important and remarkable nation of the western Chaco.
● 161 The statistics concerning them vary a great deal: the figures, given with their usual exaggerations, vary between 41,000 and
[114] 15,000 warriors. The Chané are included in this number, which completely removes all value from these statistics." (Kersten, pp. 68-69.)

131 Today the boundaries of the Chiriguano have stayed
[178] about the same. But even though they inhabit a territory whose extent has varied little, their situation has none the less
[162] undergone great changes. Several thousand half-breeds from Tarija, Santa Cruz, and Chuquisaca have settled inside this area that we have defined. A Chiriguano frontier no longer exists, but only remains of villages and small groups which still mark
161 the former extent of the tribe. On the other hand, the num-
131 ber of Chiriguano has diminished terribly and is diminishing each day, so that a few years from now the true habitat /333/ of the Chiriguano will be contained between the Parapiti and the Pilcomayo and will be reduced to the former Franciscan missions and to several valleys of the Precordillera, such as those of Caipipendí and Igüembé (1).

114
174
131

1. Some historians not well informed about the ethnic geography of South America have claimed that in the 16th century the Chiriguano lived well beyond the boundaries I have indicated. One of them (Dr. Fulgencio Moreno) went so far in this direction that he attributes to the Chiriguano the possession of a large part of northwestern Argentina and pushes this fancy to the point of locating them almost as far as in the province of Córdoba. Mr. Coni in an excellent monograph, documents in hand, has done good justice to these bold allegations and has demonstrated that these hypotheses were without foundation.

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

C 175 797 648 In 1732, the conversion of the *Chiriguano* was entrusted again to the Jesuits. Fathers Julian Lizardi, José Pons, and Ignacio Chomé entered the southern part of the *Chiriguano* territory and founded the missions of Concepción and Rosario in the valley of Salinas. About the same time, the Franciscans built a missionary center in Tarija and in 1757 they sent missionaries to the *Chiriguano*. In 1767, they reestablished the mission of the Purisima Concepción de Pilipili. After the expulsion of the Jesuits in 1767, the Franciscans continued their work with great success. Between that time and the end of the 18th century, the Franciscans founded many new missions north of the Guapay River (Rio Grande): Abapo, Mazabi, Cabezas, Piray, Igmiri, Tacurú, Iti, Parapetí, Itau, Tapera, Iguirapucuti, Tacuaremboti, Piriti, and Obaig. Some of these were annihilated when the Indians rose in arms in 1796 and 1799. During the war of independence, the Franciscan missions were completely abandoned. In 1845, the Franciscans resumed the conversion of the *Chiriguano*, and built a series of new missions from Itau to the Parapetí River. The more important of these were San Francisco, Tarairi, Machareti, Santa Rosa, San Antonio de Huacaya, Ivu, and San Francisco del Parapetí. In 1886, a messiah called the *Chiriguano* to arms against the Bolivians by assuring the Indians that they had nothing to fear because their oppressors' guns would only "spit water." The messiah and his followers were defeated near Cuevo.

C 668 648 175

C 797 464 167 648 101 In 1929, the last missions were secularized, and the *Chiriguano* lost the protection of the Franciscans. Many of them migrated to the Argentine where they were employed as skilled workers in the sugar factories. The Chaco war spread havoc in the *Chiriguano* villages at the foot of the Andes. The *Chané* of the Parapetí River then put themselves under the protection of the Paraguayan army, and today they live around the fort of Toledo, intermarrying with Paraguayans, whom they consider to be their kinsmen, "because of the close relationship between both *Guaraní* dialects." These *Chané* are sometimes erroneously designated as "*Guarayos*."

C 162 175 The 16th- and 17th-century chroniclers estimated the *Chiriguano* population at only a few thousand, exclusive of their *Chané* vassals. In 1810, there were 23,936 *Chiriguano* in the Franciscan missions. This figure includes only half the *Chiriguano* tribe, as the pagan members south of the Parapetí River were not reckoned. Cardús (1886, p. 242) gives the following estimate of the *Chiriguano* during the second half of the 19th century: In the province of Acero, 18,000; in the Cordillera and in the region of Izozo, 20,000; in the Chaco, from 5,000 to 6,000. Of these, only 8,000 were baptized and 3,187 lived under missionary care. In 1928, the total *Chiriguano* population was said to be 20,000. Today, after the Chaco war and constant migrations to the Argentine, their number must be greatly reduced.

C 161

ARCHEOLOGY

C 172 764 Few archeological finds were made in the region occupied by the *Chiriguano*. Nordenskiöld (1924 a, p. 40) mentions burial urns and ancient sites on the Parapetí River, and similar burials were discovered at Tarupayu. In some graves the dead were seated and were covered with several inverted bowls piled on one another. These bowls have hollow rims filled with pellets. Nordenskiöld refers also to direct burial in urns which show the characteristic corrugations of the *Chiriguano* and *Guaraní* ware.

C 172 At Yumbia, in the Province of Tarija, at the borderline between *Chiriguano* and *Quechua* territory, the present author obtained fragments of pots with hollow rims, an anthropomorphic vessel with ring-shaped body covered with a red slip, and a specimen of beautiful stone panpipes with

/3 cont./

133 The lakes are natural, but not permanent; they are
[135] many and large; in some the water is very good, but from
others not even the cattle /4/ drink, because it contains so
[132] much saltpeter. They all receive water from the sky, which
sometimes falls with great force and fills them at a single
time. White Christians are now making artificial lakes,
especially in the Gran Chaco and in the vicinity of Caipipendi.
271 When water is completely lacking, the Indian scratches the
824 ground, looking for the root of the "sipoy," samolo, which is
as large as a watermelon; he cuts it at the top, squeezes the
pulp with his hand, it turns to water, and he drinks; thus the need
is met, but when this drink is taken for a long period, it gives
rise to sickness.

311 The land lends itself to farming and to cattle raising,
312 but both industries diminish in those years when the beneficial
433 action of the rains is scarce. Then the crops are lost, and the
132 cattle die from lack of food and from the great amounts of
water that they drink from the rivers and lakes on whose banks
they stay through lack of energy; nonetheless this rarely hap-
pens throughout the region, which, because of embracing a
wide area, in one place or another receives showers which re-
new nature.

Extent and Area

131 The Chiriguano tribe or race was extremely numerous and
• [161] thus once took in an extraordinarily large area; traces of these
[464] Indians are found in the vicinity of Tarija, and they may be
found beyond Santa Cruz, where even today Chiriguano men and
women are in larger part those in domestic service with the
genteel families. Toward the capital of the Republic the
Indians still remember that their grandparents used to live in
Tacopaya and even beyond, in Talisco, included in the same
district. Then they extended toward the Bermejo River and,
finally, eastward to within a few leagues of Carandaiti, where the
arid zone, inhabited by the Toba and other savages, begins.

/41 cont./

*136 ZORRO /fox/. -- This quadruped is not scarce here among the Chiriguano; it thus seems that it adapts to every climate. It is so intrepid that at night it will go about the towns without betraying its presence to the dogs, but if they do smell it, they pursue it immediately and even kill it, although they may suffer for it, because the dog of the Chiriguano Indian and the fox are equally skinny, but among several of them they achieve their purpose and kill it.

This dauntless beast leaves nothing; it makes its meal off whatever it encounters; it causes considerable damage in the cane fields from the time when the plants begin to become sweet and even pulls up recently planted shoots from their furrows or holes. It slashes watermelons and melons without allowing them to ripen, and as a result of this the farmer often does not taste these gifts. It also does damage in maize fields, but this is an abundant crop and the harm is not felt so much; when it can obtain chickens, it does not fail to provide itself with a good lunch or supper, and to this end it approaches towns and houses in the country by day as well.

There are several classes and sizes of them, but they are smaller, like every animal, than those of the other hemisphere. It is difficult to chase them out of the cane fields, the damage to which will only be reduced by reducing the number of foxes, and this can only be achieved by the use of strychnine or some other poison, which, mixed with small bits of meat, is placed on the various trails that they have opened, causing damage to the sugar-cane plants.

*136 *825 176 178 [161] We shall see in the course of these pages that the Chiriguano used to venerate it as a divinity with the name of "Aguara-Tunpa," or Fox-God, to whom they attributed more power because he was capable of destroying the works of the true tunpa. Today, when the region has been invaded and populated by so many whites and foreigners and the Chiriguano have been reduced to a handful scattered here and there, those who believe in such humbug are few.

174 /73 cont./
175 understood, because they spoke the same language with slight
167 differences, they joined them, and from that moment the number of the Chiriguano was increased (1).

> 1. These 4,000 Indians were not of the Guaraní race; they had gone to settle in Paraguay and had learned that language imperfectly; they were called Carius and had killed Captain García.

The 4,000 Indians who fled from Paraguay because of the continual relations that they had had with the Portuguese had, at the time when they formed an alliance with the Chiriguano, a slight tincture of superficial civilization, just as in Mexico the Indians of Tlascala had learned it from Hernán Cortes and other Spaniards. As a result of this trace of civilization they had begun to use some clothing to cover, in principle, the most delicate part of the body; they had stopped eating the flesh of their enemies and prisoners and were more humanitarian in their dealings.

Having established their abode and formed a single
[266] tribe with the Chiriguano, they introduced their kind and
[171] humanitarian customs among their ferocious friends, who softened slightly their haughtiness and pride, imitated their allies in the manner of dress, and began to abandon the barbarous custom of cannibalism, because of which they are distinguished today, and even for a long time before, from the Toba, Mataco, Tapiete, and Sirionó (2).

[197]

> 2. The Tapiete speak the Chiriguano language with a certain difference, and the Sirionó, it is believed, were ancient Chiriguano, because their language is somewhat similar.

175 The Chiriguano, thus united, continued to multiply
[161] much more and to extend their dominions into the different departments of the Audiencia, the possession of which they now had in lesser degree. Before a century had passed after the

175 /73 cont./ Before a century had passed after the
648 discovery of this New World, they were numerous in the
[131] area near and beyond Santa Cruz de la Sierra. The founders
[161] of this departmental city had quite a fight in the year 1575 in order to humble their pride, disperse them, and take charge of the territory; the Chiriguano lived in the areas around Padilla and Tomina, which were founded precisely to contain their advances, since they seemed determined to invade the territory of Chuquisaca itself, whose Audiencia ordered the creation of both settlements so that they might serve as a bulwark and impede successive new advances, new attacks, and devastations.

The city of Tarija with its territory owes its founding to Don Luis de la Fuente, who was ordered there by the Viceroy, Don Francisco de /74/ Toledo, by decree of January 22, 1574. On that date, Don Luis with his army entered the valley of Tarija in order to put down the audacity of the Chiriguano, who were advancing with their arms into the places conquered by the Spaniards. Don Luis and his soldiers were greatly surprised when they found the said valley full of a great quantity of wild cattle, which was to be a powerful aid to his troops (1).

1. It is believed that the wild cattle found belonged to a certain Zárate, who had been forced to leave his ranch by the Chiriguano, who had doubtless made him their victim.

[727] Before the Spaniards arrived and invaded the country of the Chiriguano, they were the torment of the surrounding tribes, the members of which they shot with arrows, or killed, and took captive, subjecting them to the cruelest slavery. But once the whites arrived, they had to have it out with enemies superior to themselves; fearing that some day they would have to pay for the casualties which they had exacted from those whom they had conquered and whose fertile territory they had taken over, they did not act like the Quechua, who surrendered when they might well have

λ [i.e., the Chiriguano. -Analyst]

Statistics

161 The tribe is in complete decadence and in a few more
162 years will be entirely lost. At the beginning of the nine-
[181] teenth century, that is, before the war of South American Independence, in the Tarija missions alone there were more than 23,000 souls, and nevertheless that number did not include any of the numerous towns existing between the two large Parapiti and Pilcomayo rivers or the Indians of Caipipendi, Choreti, Pipi, and others located south of Lagunillas. At that time, I can state that the Chiriguano numbered more than 200,000, inasmuch as, according to the statistics of Father Lozano, the adult men fit for war, without counting women and children, numbered from 25,000 to 35,000.

167 Although Father Lozano was referring to the beginning of the eighteenth century, the difference must have been slight, because at the beginning of the nineteenth century there was not felt as there is today the emigration to the Argentine Republic, which began when the territory was opened to trade with the founding of towns of white Christians, which there are now in great number, up to the founding of large provinces with the names of Acero, Cordillera, and Gran Chaco, nor was there so much immorality as prevails today (1).

1. New laws have been made which make recruitment for Argentina impossible, and Dr. don Justo Padilla, the present national delegate from the Gran Chaco, at the present time does not allow the law to be merely written; he lets nobody through.

165 Epidemics, vagrancy, and emigration more than any-
161 thing, in addition to scarcity of provisions, are destroying this race, which is greatly needed and will be needed later for agriculture and cattle-raising in the provinces which have
000 been mentioned. Today there is already a need for farmers.

464 797 /78 cont./ Today there is already a need for farmers, and everybody is coming to the missions looking for day laborers, muleteers, and herders, cheese-makers, house-builders, etc., etc. How will it be later? (2) The immi-

> 2. H. Montero's project, approved by the Commission in the year 1910, may well be approved by Congress, but it seems impossible to me that the caciques will report the Indians who try to go to Argentina. To charge missionary padres to send 25 per cent of the people to the intendancies, where they will receive a daily pay which is lower than what they are paid in their own town, is to drive away the missionary who cannot comply with this obligation every month because the Indians will resist it or run away.

gration of useful people, not idle people, is necessary, but not in order to destroy the missionary centers, /79/ as is proposed, because this would soon end up by destroying the tribe, but colonizing what is unpopulated. What did the government achieve by the absence of missionaries in Villa Montes? That the Indians will now not work for anyone, and only do so when they are good and ready. All the authority of a delegation was not sufficient to get a few days' work out of its population, and for this reason the previous work was at the point of being completely destroyed; weeds had taken over in the vineyards and gardens which had been so fruitful and so well maintained in the time of the earlier missionaries.

175 464 [161] Now almost all of the great Chiriguano centers have disappeared, and barely the names of the great caciques of some faction or other remain; in all of the cantons the disappearance of the labor force causes astonishment, and [797] [162] service is scarcely to be obtained for fuel. Even the missions are undergoing this decline; in Acero Province there must be some 5,000 souls, in Cordillera some 8,000, in the

/297/

Chapter Fourteen

Infidels and Neophytes of the Missions

Introduction

797
648

The continual revolts of the Chiriguano against the white race clearly demonstrate their aversion toward the Christian element, which they consider to be the effective cause of their misfortunes and of the almost total loss of their territory, of which not too long ago they considered themselves the legitimate owners and absolute rulers. It is as clear as the midday sun that the Christian, with the patience and constancy of an anchorite and in many circumstances risking his life, has gradually taken over the extensive region. Today there is no corner where an occasional Christian family is not living. In many places the
161 Chiriguano tribe has completely disappeared, whether through
464 epidemics or through loss of freedom; in some places a rather
466 considerable nucleus exists under the control of a master, either
648 because of the territory which it cultivates or because of a debt which has been contracted (1).

1. The caciques of the Curuyuqui war, in their ignorance, thought that they could recover the lost territory and, in revenge, take over most of the Republic.

797
648
[184]

The Indians located in the area to the left of the Pilcomayo River took only one thing into consideration when they resolutely refused to have a conversion mission founded: they only considered that behind the missionary would come those whom they considered invaders; they only understood that white Christians would gather behind or around the Cross, which Father Giannelli planted with considerable daring in the middle of the nineteenth century. But why is it that the Indians of Tarairí /298/ are still owners of their land? Because of the missionary, whom one faction, in its ignorance, wanted to leave when the destruction of the flourishing missions of San Francisco and San Antonio began, where six years ago building a new London was attempted, with almost

/312 cont./ The exploration of River Nunez.
Cabeza de Vaca, continued by his lieutenant, Francisco de Ribera, is a second example that shows very well that the excursions of the Guarani did not constitute exceptional deeds that were extremely dangerous to accomplish.

Having arrived at a certain distance from the spurs of the Andes, the Guarani entered the territory of the Chané Indians.

It was in one of these numerous warlike ventures of the Guarani that the Portuguese adventurer Alejo García took part with several other comrades.

I am convinced that the 2,000 (according to Díaz de Guzmán, p. 76) Guarani whom this adventurer accompanied as far as Peru formed only one of the numerous bands of warriors of this nation who, each year, from every point of the Guarani territory, used to cross the Paraguay River, then the deserts of the Chaco.

Ruy Díaz de Guzmán, who reports this event, sees things in too simple a light. A migration is not made at one time nor in one year. That of the Guarani lasted perhaps several decades, without, however, necessarily speaking of centuries. Twenty or thirty years must have sufficed for the nucleus of the Chiriguano nation to form between the upper Pilcomayo and the Guapay River. The penetration of the Guarani into /314/ the Chaco took place in a rather chaotic and incoherent fashion. The conquistadors were continually meeting on their route Guarani groups who, for one reason or another, could not succeed in joining their brothers established beyond the Chaco. These Guarani, who blazed the trails followed by the invaders, were valuable guides for the Spanish adventurers, and they were the ones who led them to Peru. For long years there were uninterrupted communication and incessant coming and going between Paraguay and the eastern slope of the Bolivian Andes.

/336 cont./

Ce 175 649 cites a people of the Zchenone (Chané) in whom by reason of their geographic situation we must see the Chané-Guaná. "They are vassals and subjects of the Mayaiosu (Mbeyá) as with us the peasants are subject to their lords." We also have no trouble in recognizing the Chané in the Quenaes (Guaná) whom Alcide d'Orbigny mentions, according to an old account, as having been subjugated by their neighbors the Chiriguano and obliged by them to cultivate their fields. In the 18th century the Chané, as prisoners of war of the Chiriguano, had been quartered /Plate V appears here/ /335/ like slaves in villages called Chané after them. When Lozano declares that the Chiriguano call their slaves Chané, an ethnic value must be given to this phrase. The state of subjection of the Chané in relation to the Chiriguano is explained in the linguistic sphere by the name which the first used to give to the seconds: chaya, 'my master,' the Chané used to say when addressing the Chiriguano, and the latter called the Chané tapii, 'my slave.'

Ce 175 999 "The little we know about the Chané who live in the lost regions of the northern Chaco is connected exclusively with the activity of the Jesuit and Franciscan missionaries of the Collège de Tarija. The first evangelized the Chané in the 17th century at the same time as the Chiriguano; and in 1734 they formed with them a doctrina /Christianized Indian village/ in the vicinity of Santa Cruz. It was called San Juan de los Pamagos and in 1767 was under the authority of a parish priest. It was only with great difficulty that the Chané could be assembled, in 1767 and 1768, into the two missions of Asero and Ito. We learn from a report by Father Pedro Bartolomé addressed to Francisco Aguirre that the Filipili mission in 1789 was made up of Chané Indians whose racial brothers were living mingled with the Chiriguano on the borders of Chuquisaca and Santa Cruz. Viedma, who visited the missions in 1786, found in the villages of the Parapití Chiriguano and Chané who were living together, united under the authority of the Franciscan missionaries. The activity of the missionaries among the Chané naturally was to have as a consequence a rupture of the bonds

[Text continues on p. 51]

/332 cont./ Permanent?

[195] [3] [361] [62] villages were there under the command of hereditary caciques. The middle course of the Parapití formed their boundary to the east. In the 18th century the Chiriguano constituted the most important and remarkable nation of the western Chaco. 161 The statistics concerning them vary a great deal: the figures, given with their usual exaggerations, vary between 41,000 and [114] 15,000 warriors. The Chané are included in this number, which completely removes all value from these statistics." (Kersten, pp. 68-69.)

131 Today the boundaries of the Chiriguano have stayed [178] about the same. But even though they inhabit a territory whose extent has varied little, their situation has none the less [142] undergone great changes. Several thousand half-breeds from Tarija, Santa Cruz, and Chuquisaca have settled inside this area that we have defined. A Chiriguano frontier no longer exists, but only remains of villages and small groups which still mark 161 the former extent of the tribe. On the other hand, the num- 131 ber of Chiriguano has diminished terribly and is diminishing each day, so that a few years from now the true habitat /333/ of the Chiriguano will be contained between the Parapiti and the Pilcomayo and will be reduced to the former Franciscan missions and to several valleys of the Precordillera, such as those of Caipipendí and Igilembé (1).

114 194 131

1. Some historians not well informed about the ethnic geography of South America have claimed that in the 16th century the Chiriguano lived well beyond the boundaries I have indicated. One of them (Dr. Fulgencio Moreno) went so far in this direction that he attributes to the Chiriguano the possession of a large part of northwestern Argentina and pushes this fancy to the point of locating them almost as far as in the province of Córdoba. Mr. Coni in an excellent monograph, documents in hand, has done good justice to these bold allegations and has demonstrated that these hypotheses were without foundation.

/393/

Decline of the Art of Pottery among the Chiriguano

323 Of all the Chiriguano industries the most threatened one
178 is doubtless ceramics. The Chiriguano can claim the glory of
415 having been until recently the last Indians of South America
/Fig. 64 appears here/ to have a pottery which deserved to be
included in the number of beautiful manifestations of this art,
so brilliantly represented in certain regions of the continent.
Today things have changed a great deal. Villages in which
one can still find women capable of decorating vessels with
the mastery of former days have become rare and are limited
415 to a restricted area. /394/ It was in the tolderías of the Timboy,
126 the Great Salado and the Little Salado, in the region of Yumbía
178 and in the Igüembé valley (upper Pilcomayo, departments of
Tarija and Chuquisaca) that I was able to collect the finest
specimens in my collection. Elsewhere it was exceptional
/Fig. 65 appears here/ /see p. 166/ to be lucky enough to lay
my hands on a fine piece; and, if I did have this luck several
times, it was almost always a question of an old vessel pre-
[797] served as if by a miracle. The Franciscan missions which
formerly gave Nordenskiöld and Holmberg such fine specimens
797 contributed less toward enriching my collections. Nothing ex-
323 presses the sad state of decline of the Chiriguano better than
415 what I /395/ could observe in the Macharetí mission. After
178 going through nearly all the huts of this large village, which in
[162] normal times has close to 2,000 inhabitants, I could scarcely
acquire five or six yambuí having some artistic value. There
[463] were no longer more than three or four women who still knew
how to hold a brush and they had to /Fig. 66 appears here/ /see
p. 167/ provide for almost the whole village. In a few years
the ancient painted pottery will exist only in memory in the
large village where the famous "Captain" Mandepona lived.

323 This decline has several causes. The first is the state of
415 profound demoralization in which the Chiriguano are found, the
178 total disorganization of their social life, and the increasing
177 influence of the white men, followed by its corruptive effects:
finally, the introduction of manufactured products, first and
foremost gasoline cans.

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

Inca fortresses were visited by Nordenskiöld (1915 a, 1924 a), who described them under the names of Incallacta and Incahuasi. They bear witness to the accuracy of the various traditions concerning the *Guaraní* invasions, recorded by the chroniclers of Perú and of the Río de la Plata. C 175 648

Along the Andes, the *Chiriguano* found a peaceful *Arawakan* population, the *Chané*, a branch of the *Chané* or *Guana* tribe, which occupied the northern part of the Chaco along the Paraguay River. The western *Chané*, after centuries of close contact with the Andean cultures, had been deeply influenced by them. They dressed like their neighbors, the Andean *Chicha*, produced a pottery which resembled that of Southern Bolivia and of the valley of Humahuaca, wore metal ornaments, and used metal tools. The *Chané* fell easy prey to the *Guaraní*, who slaughtered and ate many of them and reduced the remaining population to a condition of serfdom. The *Guaraní* invaders, having brought few of their own women, however, took *Chané* wives. The fusion of these two tribes produced a civilization in which Andean, *Guaraní*, and some *Arawak* features were intimately blended. The *Chané* did not entirely lose their identity, however, for along the Parapeti River, in the Caipipendi Valley, on the Itiyuro River, and in the Province of Salta (Argentine), *Chané* villages survived under their own chiefs. But even these have adopted the *Guaraní* language and today cannot be distinguished from their conquerors. The *Chiriguano*, nevertheless, consider the *Chané* somewhat inferior, while the latter remember the forays and cannibalistic habits of their former masters. The *Chané* language, probably extinct now, was spoken by a few persons as late as 1908. C Ce 648 195 Ce [197] C [266] C [186] Ce [197]

The number of *Chané* is said to have greatly exceeded that of the *Guaraní* invaders. They extended from the Río Grande (Guapay River) to the Argentine along the foothills of the Andes. At the beginning of the 17th century, according to Ruy Díaz de Guzmán, in the region of Machareti, 400 *Chiriguano* ruled over 5,000 *Chané*; in Charagua, 350 *Chiriguano* owned 4,000 *Chané* serfs; and on the Guapay River, 200 *Chiriguano* kept 1,000 *Chané* in subjection. C Ce 175 648 162

The first White settlement in the land of the *Chiriguano* was the ephemeral town of Santo Domingo de la Nueva Rioja, founded in 1564 on the upper Parapeti (Cordorillo) River by Manso and destroyed a short time later by the *Chiriguano*. In 1571 the *Chiriguano* attacked the *Chicha* and the natives of the Provinces of Condorillo and Barranca. To punish them for their "arrogance," the Viceroy of Perú, Francisco de Toledo, led an expedition against them. The Indians avoided battle and harassed the troops of the Viceroy until he was obliged to retreat in shameful defeat (1574). San Lorenzo de la Frontera, which became the modern Santa Cruz de la Sierra, was founded primarily to keep the *Chiriguano* at bay. C 175 648

The first attempt to convert the *Chiriguano* to Christianity was made in 1609, when two Franciscans, Augustín Sabio and Francisco Gonzalez, built a church in the valley of Salinas, but the reduction was soon abandoned because of Indian opposition. The Jesuit fathers founded a college in Tarija in 1690 and undertook the spiritual conquest of the *Chiriguano*. In 1691, Father Arce founded a mission in the valley of Tariquea, which lasted only 3 years; another mission, established on the Guapay River by Fathers Zea and Centeno, met the same fate. At the beginning of the 18th century, the Dominicans founded three missions in the valley of Chiquiacá, Nuestra Señora del Rosario, San Miguel, and Santa Rosa, while the Augustins formed the Mission of Santa Clara in the valley of Salinas. In 1715, the Jesuits reestablished their ancient mission of Tariquea. In 1727, all the missions in the *Chiriguano* country were destroyed by the rebellion of the chief, Aruma, and his followers, who feared being taken into slavery. The revolt was crushed by an armed expedition sent from Santa Cruz and composed of Spaniards, "tame" *Chiriguano*, and *Chiquito* auxiliary troops. The *Chiriguano* had been aroused against the missions by the fear of being taken into slavery. C 175 797 648

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

C 175 797 648 In 1732, the conversion of the *Chiriguano* was entrusted again to the Jesuits. Fathers Julian Lizardi, José Pons, and Ignacio Chomé entered the southern part of the *Chiriguano* territory and founded the missions of Concepción and Rosario in the valley of Salinas. About the same time, the Franciscans built a missionary center in Tarija and in 1757 they sent missionaries to the *Chiriguano*. In 1767, they reestablished the mission of the Purisima Concepción de Pilipili. After the expulsion of the Jesuits in 1767, the Franciscans continued their work with great success. Between that time and the end of the 18th century, the Franciscans founded many new missions north of the Guapay River (Rio Grande): Abapo, Mazabi, Caberas, Piray, Igmiri, Tacurú, Iti, Parapetí, Itau, Tapera, Iguirapucuti, Tacuaremboti, Piriti, and Obaig. Some of these were annihilated when the Indians rose in arms in 1796 and 1799. During the war of independence, the Franciscan missions were completely abandoned. In 1845, the Franciscans resumed the conversion of the *Chiriguano*, and built a series of new missions from Itau to the Parapetí River. The more important of these were San Francisco, Tarairi, Machareti, Santa Rosa, San Antonio de Huacaya, Ivu, and San Francisco del Parapetí. In 1886, a messiah called the *Chiriguano* to arms against the Bolivians by assuring the Indians that they had nothing to fear because their oppressors' guns would only "spit water." The messiah and his followers were defeated near Cuevo.

C 668 648 175

C 797 464 167 648 101 In 1929, the last missions were secularized, and the *Chiriguano* lost the protection of the Franciscans. Many of them migrated to the Argentine where they were employed as skilled workers in the sugar factories. The Chaco war spread havoc in the *Chiriguano* villages at the foot of the Andes. The *Chané* of the Parapetí River then put themselves under the protection of the Paraguayan army, and today they live around the fort of Toledo, intermarrying with Paraguayans, whom they consider to be their kinsmen, "because of the close relationship between both *Guaraní* dialects." These *Chané* are sometimes erroneously designated as "*Guarayos*."

C 164 175 The 16th- and 17th-century chroniclers estimated the *Chiriguano* population at only a few thousand, exclusive of their *Chané* vassals. In 1810, there were 23,936 *Chiriguano* in the Franciscan missions. This figure includes only half the *Chiriguano* tribe, as the pagan members south of the Parapetí River were not reckoned. Cardús (1886, p. 242) gives the following estimate of the *Chiriguano* during the second half of the 19th century: In the province of Acero, 18,000; in the Cordillera and in the region of Izoro, 20,000; in the Chaco, from 5,000 to 6,000. Of these, only 8,000 were captured and 3,187 lived under missionary care. In 1928, the total *Chiriguano* population was said to be 20,000. Today, after the Chaco war and constant migrations to the Argentine, their number must be greatly reduced.

C 161

ARCHEOLOGY

C 172 964 Few archeological finds were made in the region occupied by the *Chiriguano*. Nordenskiöld (1924 a, p. 40) mentions burial urns and ancient sites on the Parapetí River, and similar burials were discovered at Tarupayu. In some graves the dead were seated and were covered with several inverted bowls piled on one another. These bowls have hollow rims filled with pellets. Nordenskiöld refers also to direct burial in urns which show the characteristic corrugations of the *Chiriguano* and *Guaraní* ware.

C 172 At Yumbia, in the Province of Tarija, at the borderline between *Chiriguano* and *Quechua* territory, the present author obtained fragments of pots with hollow rims, an anthropomorphic vessel with ring-shaped body covered with a red slip, and a specimen of beautiful stone panpipes with

/77 cont./

197 194 171 "Conumi," lad, do not have an accent on the i in Chiriguano, but they do in Guaraní.

197 178 361 162 In past centuries the race, and therefore the language, embraced a great deal of territory, but today it is greatly reduced, and I can state without danger of error that it is still numerous in Caipipendi, Pipi, Choreti, Tasete, Araticu, and in the Potosí and Tarija missions; but in the former places it is scattered among many little towns, while in the latter it makes up respectable towns of 500, 1,000, and 2,000 souls (2).

2. Choreti Guasu is located on the left bank of the Parapiti in Cordillera Province; it almost forms a single town with Membirai, and between the two of them they have about 110 families.

197 178 177 797 Purity of language is now no longer found in any town or in the missions, in the first because of living among whites and continually emigrating to the Argentine Republic, and in the second, the missions, for a third reason, instruction in Spanish, which the missionaries give the boys and girls in the schools; thus, if the race is not finished first, as is feared, because of the continual epidemics and vagrancy, the language will soon be lost, and then the few books that exist will only serve as an historical monument for posterity, which will be able to recognize the merit and labor of the missionaries who spread among them, the Chiriguano, and poured out sweat with the sole purpose of civilizing them in a Christian way (3).

3. There are a grammar, a Spanish-Chiriguano dictionary, a catechism with its translation, Father Corrado's masterpiece, a small Chiriguano-Spanish "Nene" /"Infant"; the work referred to is Nino's Nene Chiriguano/, and many unpublished sermons.

/78/

Statistics

161 The tribe is in complete decadence and in a few more
162 years will be entirely lost. At the beginning of the nine-
[181] teenth century, that is, before the war of South American Independence, in the Tarija missions alone there were more than 23,000 souls, and nevertheless that number did not include any of the numerous towns existing between the two large Parapiti and Pilcomayo rivers or the Indians of Caipipendi, Choreti, Pipi, and others located south of Lagunillas. At that time, I can state that the Chiriguano numbered more than 200,000, inasmuch as, according to the statistics of Father Lozano, the adult men fit for war, without counting women and children, numbered from 25,000 to 35,000.

167 Although Father Lozano was referring to the beginning of the eighteenth century, the difference must have been slight, because at the beginning of the nineteenth century there was not felt as there is today the emigration to the Argentine Republic, which began when the territory was opened to trade with the founding of towns of white Christians, which there are now in great number, up to the founding of large provinces with the names of Acero, Cordillera, and Gran Chaco, nor was there so much immorality as prevails today (1).

1. New laws have been made which make recruitment for Argentina impossible, and Dr. don Justo Padilla, the present national delegate from the Gran Chaco, at the present time does not allow the law to be merely written; he lets nobody through.

165 Epidemics, vagrancy, and emigration more than any-
161 thing, in addition to scarcity of provisions, are destroying this race, which is greatly needed and will be needed later for agriculture and cattle-raising in the provinces which have been mentioned. Today there is already a need for farmers.

464 797 /78 cont./ Today there is already a need for farmers, and everybody is coming to the missions looking for day laborers, muleteers, and herders, cheese-makers, house-builders, etc., etc. How will it be later? (2) The immi-

> 2. H. Montero's project, approved by the Commission in the year 1910, may well be approved by Congress, but it seems impossible to me that the caciques will report the Indians who try to go to Argentina. To charge missionary padres to send 25 per cent of the people to the intendancies, where they will receive a daily pay which is lower than what they are paid in their own town, is to drive away the missionary who cannot comply with this obligation every month because the Indians will resist it or run away.

gration of useful people, not idle people, is necessary, but not in order to destroy the missionary centers, /79/ as is proposed, because this would soon end up by destroying the tribe, but colonizing what is unpopulated. What did the government achieve by the absence of missionaries in Villa Montes? That the Indians will now not work for anyone, and only do so when they are good and ready. All the authority of a delegation was not sufficient to get a few days' work out of its population, and for this reason the previous work was at the point of being completely destroyed; weeds had taken over in the vineyards and gardens which had been so fruitful and so well maintained in the time of the earlier missionaries.

178 464 [161] Now almost all of the great Chiriguano centers have disappeared, and barely the names of the great caciques of some faction or other remain; in all of the cantons the disappearance of the labor force causes astonishment, and [797] [162] service is scarcely to be obtained for fuel. Even the missions are undergoing this decline; in Acero Province there must be some 5,000 souls, in Cordillera some 8,000, in the

/79 cont./

178 Chaco and O'Connor Province, 5,000, in the Tarija
464 missions there are 4,500, and in those of Potosí, 3,905, which
[197] makes a total of 26,405, including men and women, big
[162] and small, old and young. But of this number there are scarcely 8,000 day laborers, or strong men fit for any work, and what is the extent of land in Chiriguano hands through
[131] their own will or that of others? Some 140 leagues from
[465] north to south, more than 40 from east to west; if today the cultivation of these lands is difficult, tomorrow it will be impossible; if today it is hard to pay 40 centavos to the day laborer, tomorrow they will not be found for 80 centavos.

648 There is a great struggle under way between the
[167] Chiriguano and the white; the latter struggles to increase his fortune and hacienda at any cost and tries to dominate and does dominate the Chiriguano, as one who is nobler and more powerful; the former struggles for his existence as long as he can, but, because he is weak and inferior, yields to the power of the white; when his spirit has been broken by the superior force which dominates him like a slave, he disappears and imperceptibly emigrates to a place where he is treated with more apparent humanity, though not certain and real, but which the Indian does not recognize (1).

[464] 1. According to references, the day laborer in Argentina earns 25 or 30 nacionales per month, without food, which in a foreign land is expensive for the Chiriguano; nevertheless, since the clothing and the animals which the company sells are not expensive, the day laborers who are economical and not given to drink come back well clothed, bringing a horse or an ass or clothing for his children and wife.

178 From this /80/ it follows that the large towns of former
197 times and the very missions which antedate South American
361 independence have in some cases disappeared entirely and others are on the point of disappearing.

/94 cont./

631 If this were the case, the boundaries of the new canton
648 should be the following, according to the agreement made by the Representación Chuquisaqueña /from Chuquisaca/: on the south the left bank of the stream Vitiacua, on the north the parallel of the stream of Cuevo, on the east the range of Aguaragüe up to said parallel, on the west the ranges of Saararenta and Irenta, and on the southwest the stream of Chimbe.

[797] Within this delimitation are included several Chiriguano
[162] towns, the most populous being the missions of Santa Rosa, with more than 1,200 inhabitants, and that of San Buenaventura de Ivu with 652 souls.

White families are few, but not less than 40, which could give a total of at least 160 souls. It might be that with time this small population will grow in the new canton, as that of Cuevo grew.

797 Years are needed for the Chiriguano Indian to be able to
177 take over the political government of a town, in spite of the
463 fact that in the relatively new missions there are musicians,
648 carpenters, woodworkers, masons, saddlers, shoemakers, tailors, and young men who know how to write well and to read better, but it is one thing to know an art or a trade and quite another one to have to administer justice.

/95/ The experience of many years of missionary life and what I have seen in the missions abandoned since the war of Independence justifies my opinion that many years are needed for the Chiriguano Indians to be able to fill certain public offices such as that of corregidor and parish alcalde.

A Project

000 The eastern zone, which today belongs to the three departments of Santa Cruz, Tarija, and Sucre, is somewhat threatened by foreign countries, but it might be that the Bolivian Republic could make friendly settlements with the neighboring nations.

/101 cont./

361 797 1. Machareti. -- Father Jerónimo de la Peña was the first to enter Machareti, but, before he could begin any work, death intervened, and only after a century, that is, in the year 1869, could the Cross of Redemption be raised, around which began to gather the settlers dispersed by the war and the death of Captain Taruncunti, not very friendly to the missionaries.

[162] Before the mission had been founded for ten years, it numbered more than 3,000 souls, but today it is much smaller, [167] its inhabitants reaching 1,500. Emigration to the Republic [464] of Argentina is a real plague for this area, because the principal recruiters of Indians for work outside of Bolivian territory are there, and it is useless to cite laws, because there are clever interpreters; meanwhile all wail for workers.

361 [133] Machareti has a delightful and picturesque panorama; to the north and to the east the human eye cannot take in the immensity of the plains or the exuberance of the woods and the variety and caprice of the hills. The town is located on a great plain, but is now quite reduced; its buildings, atop a high hill which dominates everything; it has a beautiful church with painting and /102/ gildings, a mission house of two stories, two great halls, with their respective patios, for instruction, and a third one for the music school, and also other buildings for shops (1).

361 797 131 1. When the Machareti mission was founded, it cut off the retreat of the bellicose Huacayeños, who were coming into the Gran Chaco by the Chorro road, some 15 leagues from Huacaya and some 12 from Ivu; its altitude above sea level is 771 meters and it is located at 20° 49' 58" south latitude and 63° 3' 44" longitude west of the meridian of Greenwich.

/102 cont./

797 2. Tigüipa. -- This mission, dedicated to the universal Patron of the Church, the Patriarch St. Joseph, began its existence on May 20, 1872, the day when, for the first time, the Holy Sacrifice of the Mass was celebrated, and there was planted in its territory the Tree of Redemption; it is some 12 kilometers from Machareti, with quite a rough road.

361 797 [162] At present it has a population of 800 souls. The town, made up of both infidels and neophytes, is quite neat; the buildings are not very well arranged, and the ones which merit consideration are: its tall and beautiful church, broad and well-proportioned, with its magnificent choir, gilded altars, and well-turned railings; in addition, the beautiful mechanism of double trusses which support the roof. Its house is new, of a single story, and was begun in the month of August or July in the year 1910 and dedicated in March of this year; the other buildings neither follow any arrangement nor are of any worth, and lend to the whole a rather sad appearance, but once the renovation of both towns has been completed, the planned arrangement of the buildings for instruction and workshops will be made.

[133] Its panorama has nothing in particular: to the west, the last range of the Andes, to the north and south, some rather high hills rise at a short distance and obstruct the view for the curious observer, who, frustrated in his desire to see and observe, finds a slight relief to the east, where the horizon opens out and gladdens the heart; it seems to be the older sister of the San Pascuál de Boicovo Mission. The climate is in general healthy, in spite of the fact that the mission is located in a hollow, but the water, or the location of the place, dulls the understanding of its residents, according to what all the travelers note (?). /Illustration appears here./

[563] [464] [131] 2. In the years of abundance several nomadic tribes come to this mission and remain there serving the Chiriguano in exchange for food. Its elevation above sea level is 715 meters, and it is located at 20° 27' 18" south latitude and 62° 14' 44" longitude west of the meridian of Greenwich.

[text continues on p 141]

/104 cont./

797

has left the mission house and the garden for the use and comfort of the Father-Chaplain. It is located at 778 meters above sea level and at 21° 46' 10" south latitude and 62° 48' 35" longitude west of the meridian of Greenwich.

5. San Francisco and San Antonio. -- In the missions called San Antonio and San Francisco del Pilcomayo the Supreme Government decided to found a city under the name of Villa-Montes; but after it was handed over by the missionaries in the year 1906, instead of progressing, those flourishing settlements have retrogressed. The vineyards and gardens have deteriorated. The buildings are falling into ruin, and morality fell precipitously and is progressively worse there. The schools for boys and girls have been reduced to very few students, and for these few the national treasury distributes 160 bolivianos per month, while to the chaplain who has to live there it pays no more than 240 bolivianos per year.

[871]

Everything that belonged to the two missions, such as implements, carpentry, buildings, sugar mills, cattle, horses, etc., was handed over with an inventory to the national delegate, Dr. Don Leocadio Trigo, and the missionaries, without being able to use even a cell which might serve as lodging for the night for the Father Chaplain, had no other recourse but to shake even the dust from their sandals.

[162]

The approximate population of Chiriguano natives in the above towns is 4,500 souls (2).

2. The Supreme Government rented the mission building to the German company, which has made little progress. It is located at 460 meters above sea level and at 21° 16' 15" south latitude and at 62° 20' 2" longitude west of the meridian of Greenwich.

/204 cont./

643 Regional caciques are now very few, and they themselves
648 are submissive servants of the whites, who do not let them live
797 as they would like very much, but in matters referring to morality do let them live as they wish. Only the missionary makes them understand that such a life is contrary to divine law, but the Chiriguano refuses to understand this.

595 The important men assert that to possess many wives is
574 necessary for the preparation of chicha for offering hospitality
829 to guests and visitors. This excuse is not satisfactory, because
643 the cacique in the town where he resides is like an absolute king, and nothing is easier than to command his subordinates or relatives and always have his favorite drink; no matter how much of it he may want, he can always ask for more for himself or for his guests.

595 The subaltern caciques in general are bigamists, but they
622 do not become such in their youth, when they are like humming-
[582] birds, but at 40 or 50 years of age. This happens when the first wife is older than the husband, or his eye is caught by another younger woman whom he brings to his house as soon as he has her in peaceful possession. He at once orders the old woman to respect her. If she is quiet and consents, she continues working and serving her rival in the interest of food, but if she is not quiet, she receives a good dose of the stick, is thrown out of the house, and does not get back into it. But there are strong-minded women who do not allow the desecration of their home /illustration appears here/ /205/ where they have lived for years and have children of both sexes, who are then left behind because the man moves to the second wife's house (1).

[162]
[169]

1. Formerly, women were abundant because of wars. Today they are abundant because of the emigration of the Indian men to the Republic of Argentina.

128

The reader will find that I have endeavoured to make this part more graphic than Part I . From the maps of bibliography it will be seen regarding what regions I have had access to literature; it can also, in some measure, be seen whether the blanks on the maps are due to those particular tribes never having been closely studied.

The maps of distributions in this work are fewer in number than in Part I. This is because we find the Chiriguano and Chané, or one of these tribes, on twenty-nine maps in Part I. Part I is largely preparatory to Part II. Parts I and 2 together contain 45 maps showing the distribution of culture-elements occuring among the Chané and (or) Chiriguano.

C
CE
121

All who are interested in the ethnography of S. America will, I venture to think, find the maps worth close study and will see that from them various deductions can be made not only respecting the Chiriguano and Chané Indians but also as to the ethnography of S. America in general. In some measure I have, indeed, endeavoured to do this myself.

C
CE
131

The land of the Chiriguano and Chané the Indians streches from near Sta Cruz de la Sierra to near Rio Bermejo. Southwards of Sta Cruz the territory inhabited by the Chiriguano is continuous. The Chané, on the other hand, live in several different quarters, some at the river Itiyuro in the Argentine, some at Caipipendi near the Rio Pilcomayo, some at the Lower Rio Parapiti, and others near *Itau south of the Rio Pilcomayo. The neighbours of the*

Chiriguano and Chané are the Mataco-Vejos, Mestizos, and Whites to the south, the Matacq, Toba, Tapiete, (Yanaygua) and Tsirakua to the east, to the north Mestizos and Whites, and to the west Quichua, Mestizos, and Whites.

S:Nordenskiöld E-5,4 (1908-1909, 1913) 1920
SF10 Chiriguano SF10
Chane SF8

Some Choroti live near Yacuiba. In nearly all of the Chiriguano territory there are Mestizos and Whites. There are also several large missionary stations in their territory. Some few Chiriguano live in the village of Sta Rosa to the north of Sta Cruz de la Sierra. Some Chiriguano who sought refuge in central Chaco after their last rebellion, live there still. They are the only tribe of Chiriguano-Indians who are quite independent of the Whites.

C 101 162 131 [777]

The country which is inhabited by the Chiriguano and partly by the Chané is a border land between the Andine mountains and the great plain of the Chaco. It is in the valleys between the outermost mountain ridges towards the Chaco and on the plain to the east of them that the Chiriguano and the Chané live. The land of the Chiriguano and Chané-Indians is not a real country of primeval forests. There are some great forests, but on the whole it is sparsely wooded, in places even very poorly wooded. The supply of water is the governing condition for settlement in the land of these Indians. It may be said that wherever there is access to water there the country is inhabited, at any rate as regards the region south of the Rio Grande, one of the great rivers that run through their territory. There need not be a great supply of water for the Indians to find the country inhabitable. All that is necessary is sufficient drinking-water for man and beast, as at Itafique and in the Caipipendi valley near Rio Parapiti.

C Ce 131 133
C Ce 361 312

The biggest rivers running through the territory of the Chiriguano and the Chané are the Rio Grande, the Rio Parapiti and above all the Rio Pilcomayo. The Rio Grande may now almost be considered the boundary river of these tribes towards the north, and is of but little importance to them. The Rio Parapiti is a strange river. While well supplied with water in the mountains it is almost shrinks to nothing in the plains during the dry season. During the rains it is very full of water and may be dangerous to ford. Fish are plentiful only in the Rio Pilcomayo, and we

Rio Parapiti.

/173/ Chapter Eleven

From the Land of the Chané and Chiriguano Indians

Everyday Life in the Chané and Chiriguano Huts

As a rule, I felt very comfortable in the huts of the Chané and Chiriguano. The life in these villages is exactly the same. If one describes one village, he has described almost all of them.

Like all the other Indians whom I visited south of Santa Cruz de la Sierra in Bolivia, these Indians live in villages. Some of these villages are quite large and inhabited by several hundred persons. Often many villages lie close together. The huts, as a rule, lie around a market place on which sweeping trees are occasionally planted for shelter in the rainy season. The market places serve as playgrounds and meeting places. The huts, in contrast to the round Chaworí and Ashluslay huts, are square, and their doors, facing the village, are set in the gable. They are made of cane or wooden slats, with roofs of grass. Not infrequently they are plastered with earth.

/207 cont./

says it is probably known to all Brazilian tribes. On the other hand, the custom of the couvade seems to be unknown to the Quichua /Quechua/ and Aymara, that is to say, to the mountain culture in Bolivia and Peru. This is one of the many contrasts between the Indians of the mountains and of the virgin forest. Ee 846 171

The Guarayú Indians of northeastern Bolivia told me that if a man goes hunting immediately after his wife's confinement and, for example, shoots a parrot, he might kill his child. That is, during the first days of life the soul of the child follows the father. G 846 224 774

Illegitimate children are very rarely born among the Chané and Chiriguano. I believe, perhaps I am mistaken, that the women of these Indians are chaste before they marry. On the Rio Itiyuro, among about 500 Chané, there was only one child born to an unmarried woman. Deformed children are very rarely born. Thus, from what I saw and what Batiayu said, in the entire Parapiti Valley, among 1500-2,000 Chané, there is no one who was born blind, none cross-eyed, no idiot, and only one with deformed extremities, and four deaf mutes. I did not observe any Indians with a serious stutter. Ee 848 Ce 848 162 C Ce 732 [762]

I do not know whether among these Indians, too, deformed children are immediately killed, but this is probably the case. Nor do I know whether abortion occurs. It is certain, however, that these healthy women seldom bear children who are not well formed. Nevertheless, in the Parapiti valley, as was said, there was a boy with deformed extremities. One hip bone was too short and one arm was also crippled. This boy was treated by all with extraordinary kindness, /208/ and loud approval was expressed when I gave him a few small presents. Ee [947] Ce [D23] Ee

When the child begins to walk, it is given a name. This is not given by the father or mother, but by its grandparents. Among the Chané on the Rio Parapiti I wrote down a few names. If it is a boy, he is called, for example, yandurembi (lip of the rock), hulucaca (guanaco), tinunambi (armadillo ear), yánducúpe (ostrich back), vacatuyáca (cow head), aguachivi (fox urine), derée paravée (your poor eye); if it is a girl, for example, ñanayupi (guava blossom) (1). A great many of the names are 553 603 Ce 551

/7 cont./ By continually enslaving the Indians of the subjugated tribes, the Chiriguano by the end of the 16th century already had numerous subjects and auxiliaries in their wars. Most of the Tamacocies (later called Chamacoco) and the Chané were among these, and if other documents of 1583 and 1584 relate that the Tamacocies, the Xores, the Mares, and the Yuracares were their allies, it is probable that this was a case of such Indians violently subjugated and used as auxiliaries in war (14). While the Tamacocies (Chamacoco)

Gi

14. Moreno II, pp. 72 and 73.

were subsequently emancipated from their Chiriguano conquerors and emigrated to the east, most of the Chané, who formerly were a very populous nation, remained in subjugation for a long time (15). Because of the poor treatment that the

15. Moreno II, p. 249.

Chiriguano normally accorded them, there was always a contrast between the two nations, and the Chané preferred to be dependent on the Spaniards rather than remain in slavery to the hated Chiriguano (16). According to Corregidor Tomina's report

Ee
Gi
175
648

567

16. Moreno II, p. 250.

in 1618, already mentioned in what has been written above, the relationship between the Chiriguano population and the Chané population was such that the number of pure Chiriguano was smaller than the number of their subjects. According to the estimate made in this connection, the population of the Chiriguano of the Cordillera consisted of 1,500 pure Chiriguano, among whom were distributed 10,000 Chané. Among the 400 Chiriguano of the province of Machareti were distributed 5,000 Chané slaves. Yet for several centuries the Chané must have remained in harsh slavery to the Chiriguano until, in the second half of the 19th century, the formidable resistance of the Chiriguano was broken, and, after a severe blow,

/16/

36 62 162 The town Ibitibi in the southern part of Chiriguano territory, south of the Pilcomayo River, examined minutely by Eric v. Rosen, was inhabited, according to the Indians, by about 300 persons. The town was located on a plain surrounded by mountains and forests. The houses formed a large circumference, the cacique's house being in the middle. Some shade trees had been planted in the open plaza between the cacique's house and the other houses. In other Chiriguano towns visited by v. Rosen, houses were dispersed without any order. According to the observations of v. Nordenskiöld too, Chiriguano towns are sometimes quite large and inhabited by around 100 persons. Often several towns are near one another. The houses are generally around a plaza sometimes planted with trees and serving as a place to play and to hold meetings.

342 We know the form of the Chiriguano houses in detail through v. Rosen (63), and primarily through the good photo-

63. Eric v. Rosen, op. cit., p. 191; Figs. 188-197 and 217.

[335] graphs of such houses. The houses are rectangular and their roofs end in points. Walls and roofs are held up by posts. The walls consist either of only vertical poles made from branches or reeds, close together and tied by horizontal ligatures, or of interwoven poles whose interstices are plastered with mud. The roof (opitié) is covered with straw. One type of house was illustrated in a photograph by v. Rosen (64), on which one

64. Eric v. Rosen, op. cit., Fig. 190.

side of the roof projects at the top over the other side of the [171] roof. The same house type also exists in the ancient culture of the Peruvians, as is shown by sketches found on the surface of ancient Peruvian vessels.

C Ca /84 cont./ The subjugated Chané were distributed among
175 the various social communities of the Chiriguano as subjects or
648 slaves. In the "Relación del Corregidor de Tomino Don Juan
162 Ance de Alvedia" in the year 1618, it is said that in the Province
[567] of Macharetí, "which is Pilcomayo and its environs," there
lived scarcely 400 pure Chiriguano, among whom were distributed
5,000 Chané "to one 200, to another 100, to another 80, and in
this way up to said number." In the Province of Charagua 4,000
C Ca/ Chané were distributed in the same manner to the 350 Chiriguano
175 of this province, and upwards of 1,000 Chané to the 200
648 Chiriguano of the Province of Guapay. As in other documents, in
567 this one as well, there is mentioned the ill treatment which
these subjects had to suffer from the Chiriguano and the hate
which they had toward their oppressors (318). The Chiriguano

C Ca [146]

318. Moreno II, pp. 750 and 104.

scornfully called the Chané "tapé," while they themselves were
called /ñi/ by the latter "chaya," that is, "my master" (319).

319. Moreno II, p. 754.

C 175 Although most of these subjects or slaves were made up of Chané,
648 there were also among them other Indians who had been subjugated
567 in the expeditions, for example, Chicha Indians (320), and among

Ca [567] [648]

to Techo (322), whose report was written in the second half of

322. According to Moreno II, pp. 256 and 707.

the 17th century, the Chiriguano commonly sold some of their
slaves to the Spaniards.

/211 cont./

853 222 There is no special food or more abundant food for mothers after childbirth. She who gives her breasts to her little one eats little and extremely poorly. Her ordinary food is parched maize, parched maize meal, bread made of the same, herbs, beans, gourds, other things of this nature, and rarely a little purchased beef, other meat from animals that died from sickness, lack of pasture, or snake bite, and, finally, game or chicken. In spite of this extremely bad food, milk is abundant in her breasts; the children are almost always hanging from them and sucking and never seem to dry them up, which indicates that they are excellent nursers.

648 424 853 Mestizo or white mothers who sometimes have little or no breast milk because of sickness or some accident make contracts with Chiriguano mothers, pay them well, and treat them better, but it seems that continued good and satisfactory nursing harms them, /212/ it also being prejudicial to the breast as well as to both newborn babies, the weaker child succumbing first (1).

1. Naturally the Chiriguano women refuse to be wet nurses for white children, because they abhor them. When through experience they learn of the sad consequences, communicated by others, they resist even more and only do it when force or the right of the stronger prevails.

Twins

845 [63] [65] Multiple births are rare, and those of two children are frequent. In the former case the newborn babies die very soon, and in the latter case one almost always lives, and many times both live. When twins survive or through the death of the mother a newborn child is left an orphan, it is very easy for the grandmother to care for one twin or the orphaned child. 236 603 [853] [824] Although the old woman may have reached or passed 60, she

/226 cont./

881 178 do not advise anyone of their puberty, even their mothers, and the consequences are sad in no few cases. They do not tell anyone because the older girls make fun of them.

•163 582 A single thing is noted in the missions, and it is that the neophytes, when they get to the age of about 35, stop having children. Perhaps this is because they marry very young, at about 16 to 20 at the latest. If it is true that the Chiriguano 581 women of old were ready for marriage /227/ as soon as they came out of their hiding or fasting, the union which they contracted was certainly neither continuous nor for life with the same person. One or two months with one, then a rest until giving birth, afterwards again joining the same man, or perhaps she would seek out another if the first had become bored 799 with her or she with him. But this does not happen in the 581 missions; those who contract marriage do it for life, because it is a Catholic union and, as such, indissoluble, just as the natural marriage of the infidels would be, but the Chiriguano does not understand this, since in principle he wishes to be a hummingbird, coming to rest on many flowers and not stopping at any of them until he reaches a certain age.

881 785 184 In the districts where the fasting lasted for a year, such as in Cuevo, before the town of San Juan Bautista and the Santa Rosa Mission were founded, after the first rigorous month the maidens were made to eat meat and beans also, and they were even allowed to drink a little mild chicha, so that they would not become too weak or die. If the chicha had turned sour, it would be prejudicial for later married life, producing the effects of which I have already spoken.

881 178 177 Finally, to conclude such a delicate subject, let it be noted that at the present time the custom of such a rigorous fast for the female sex is observed in very few places; today the region is inhabited by the white race, which is making them understand that all this is superstition, because of the example of their daughters, who, in spite of the fact that they have done nothing of what has been said, live in perfect

Ce 551 /208 cont./
untranslatable. Not infrequently a nickname is added to this name. Thus, for example, the Chané chief Boyra (Boy-snake) was called yŭruhuasu, which means big-mouth. Indeed, old Boyra was a talker who had a great weakness for everything that was a bit indecent.

Ee 862 ●163 C 847 Mothers nurse for an unusually long time, and it is several years, as a rule, before they have another child. Perhaps the woman also aborts the fruit of her womb occasionally, like the Choroti woman, so that the family will not become too burdened.

E 163 In the mission station in Ivu I tried to gather statistics about the number of surviving children in 127 Chiriguano marriages and found that in ten marriages there were no children, in 27 one, in 35 two, in 29 three, in 13 four, in 9 five, and in 4 six. These figures, however, are quite uncertain. Nevertheless they show that here, as among many other Indian tribes, there is a sort of two-children system.

C 847 114 C [113] Corrado (2) maintains with certainty that infanticide occurs

2. Corrado: El Colegio Franciscano De Traija y sus misiones. Quaracci, 1884. Pages 526-527.

among the Chiriguano. It is done in desperate cases among us, too, and therefore the example cited by Corrado means nothing. C 847 The question is: does /209/ infanticide and abortion occur as an institution accepted by the tribe, as among the Choroti? /Fig. 110 appears here./

C Ee 868 857 The Chané and Chiriguano children, as has been mentioned, are brought up in freedom. They spend their childhood playing. Gradually the child begins to help its parents in small matters, for example, in carrying water and wood, tying up /210/ the domestic animals, fishing, etc. The girls learn spinning, weaving, making clay vessels, brewing maize beer, etc. from their mothers. They learn everything by imitation. The boys pursue small birds around the village and in this way learn the use of weapons. The children accompany their parents to fish and to till. The boy

/484/

412 However, these awls are too abundant in each village for their use to be only sacred. It is probable that the Chiriguano use them as a simple tool for solely secular purposes.

[174] At Tilcara, Debenedetti (2, Fig. 176, p. 232) discovered specimens made of deerhorn identical with our Chiriguano examples.

824 757 8. I have in my collections seeds whose virtues are multiple: they are an excellent remedy for skin eruptions, ulcers, and toothaches.

9. For stomach-ache the Chiriguano recommend the absorption of particles of wood (mboipinda).

232 [824] 10. Certain seeds (of a graminaceous plant?) when crushed give a paste or powder with which they treat animals whose sores are attacked by worms.

11. When cows' hooves tend to work loose, they bathe them with fragments of limestone (itakwi).

757 237 12. Fat extracted from a cow's foot is an effective ointment for cases of rheumatism.

13. The beak of the toucan is said to enjoy great medicinal properties. They grate it and drink in water the powder which comes from it (Campana, 111).

Stitches in the side and dysentery are treated with a piece of armadillo shell burned, ground, and dissolved in water, which the patient drinks.

757 [114] In the Diccionario Chiriguano-Español y Español-Chiriguano etc. (passim) and Nino's book (pp. 288-290) is found many a very interesting piece of information on the pharmacopoeia of the Chiriguano. I shall summarize them in order to complete my own observations.

757 164 1. The oil which floats on kiwi, when it is done, is a good remedy for headaches.

2. Salt, ground and drunk mixed with the urine of a small child, quiets stomach pains.

[824] 3. Rheumatism is doctored by applying on the ailing part a branch of ulala (Rankawina) from which the thorns have been removed and which has been heated.

[644] /484 cont./
[757]
[824]

4. To stop dysentery, one must drink a decoction made of corn and watermelon seeds ground together.

[237] 5. Stitches in the side are treated by drinking a fragment of armadillo shell ground up and by rubbing the ailing place with a portion of this same calabash heated.

6. Tumors and swellings of the throat or knee are made to disappear by applying on the sore region the leaves of a shrub called urukuna, heated in a pot. Another herb (yundurimbiu) has the same virtue.

/485/ Urukuna leaves put in compresses on the skull dissipate headaches, protect one from congestion, and cure erysipelas. The leaves of yandipa (hediondilla) have all the virtues of urukuna.

7. Hemorrhages are stopped by means of latex or the roasted leaf of the liana supuapempe.

8. Kaa-upaya is an efficacious herb in cases of stomach ailments; and soto root cures pains in the feet (rheumatism?).

9. Guaya is a liana which cures any swelling in the side.

[753] [821] 10. Goiter, rare among the Indians, is attributed by them to the sun. They treat it with tutía, a yellow fruit which reminds one of an apple, or by putting around the neck compresses of the blood of the gallinazo, carancho, or handurria, kinds of vultures.

11. Ophthalmia or conjunctivitis is doctored with drops extracted from the bark of the algarrobillo or with the glue taken from the bud of the membiría plant. The leaves of yandi-wope are excellent for cases of ophthalmia.

12. A variety of caraguatá makes diarrhea stop.

13. The flower kaa-ro (bitter herb) cures skin eruptions and is as good for malaria.

14. The herb inái (tooth of water) is a remedy against whooping cough, which can also be treated with an infusion made of boiled or roasted wasps and drunk warm.

15. Tingi bark attached around the belly is excellent for fighting dropsy, as are the leaves of the ñuru (palo de india), a tree reminiscent of laurel, or the herb kaa-paye, taken as an infusion.

164 /485 cont./

757 16. Gonorrhea is treated with the boiled root of the
824 mistol and tapir fat.

[237] 17. Earaches pass away if drops of chicken, beetle, and cicada fat are poured into the auditory canal.

18. The root of chirimoya del monte (aratibu) is a good antidote if one feels poisoned.

752 19. Snake bites lose their seriousness if one applies some
824 of the herb uruuru, guaje, tobacco, or nicotine on the wound.

The sap of the liana isipo-poro-mboyi, although poisonous, nonetheless constitutes an excellent antidote for the same cases.

752 20. By putting melted wax on the wound, you do not risk
237 dying when a mad dog has bitten you.

21. Wounds produced by a sharp instrument heal if burned chicken feathers are spread on them.

757 22. It suffices for a woman to drink the powder of a shell in water to put her fallen uterus back in place.

/486/

757 23. The red leaves of the añankamisa, iwira-ro (quebracho
824 cacha) bark, the woody plant toba-pitše, taken as infusions, are as many remedies for fever.

[752] 24. Compresses of kaa-ruruntirái make abscesses burst.

25. In case of constipation it is good to drink the latex of the kaa-si (cardencha, lechetresna).

752 26. After any serious fall one must drink water in which
757 one has made an infusion of a sort of vervain (kaimberai)
824 pounded beforehand. The consequences of the shock will not be felt if one applies on the sore regions poultices made with this same plant carefully ground.

27. Recommended for spreading on sprains are cara guatá leaves or a thick glue obtained by boiling the bark of iwira-pitiyu-wasu. This substance is equally good for fractures.

757 28. The Chiriguano chew the bark of iwira-pitiyu-wasu to make
824 their violent toothaches stop and to make their teeth more solid.

29. A cataract is doctored in the following way: One boils kuruwa leaves and bathes the patient's head with this infusion.
[237] Then one takes the gall from the dorado fish with pincers or

/42 cont./

*136 We can count among the amphibians the "Boicururu," or snake toad, which is nothing but the water tarantula, but it is very poisonous here; it is found near lakes in the swamps. Frogs are found in small numbers in the center of the region; [262] they abound where there is water on the banks of rivers; only the Toba and other barbarians eat them; the Chiriguano do not. There is an infinity of "Cururu" toads in terms of size, color, and song, one being distinguished among all of them, the one that the whites call "Rococo" and that is heard continually and loudly at a distance of one kilometer at night in rainy weather and where there is water.

*136 *825 [257] [164] The toad is medicinal; one or two large ones are gently caught alive and, one after the other, applied /43/ to parts of the body affected by erysipelas, which is cured very efficaceously, with the animal being left dead, doubtless because with its cold belly it absorbs all the heat which the sick person has in the said painful parts; more than once I have seen erysipelas cured in this way. In rainy weather there are so many of them that it is impossible to sleep near the place where they gather to sing their discordant tattoo; at the end of a heavy shower is when the noise of the toads is most unbearable.

*136 Fish abound in the large rivers, where there are shad, bagre, and dorado; the latter reach a length of two meters, as I have seen, and are very palatable and drip blood like cow's meat. Then in the same rivers, streams, and permanent lakes, there is an infinity of small "pira" fish, which are good to the taste, and finally there is no lack of eels, "Chorinchi," 43 or the useful leeches, "Evoipe." Indians who live on the banks of rivers of great volume trade in fish; to be sure, they plant fields, but generally they do not harvest because of the lack of rain, but obtain maize in exchange for fish; dried shad tastes like cod and is worth 10 and 20 centavos.

*136 Insects are innumerable, but not as abundant and varied in their form, size, and color as they are in the region of the Beni, the Mojo, and others; they are a hundred times more numerous than all the quadrupeds and birds together; there are bothersome ones, like mosquitoes and zancudos /long-beaked mosquito/, and there are poisonous ones, which, however, rarely cause death.

/45 cont./

*136 mouth, and then it goes to another place to repeat the operation. The eggs remain in the ground one month /46/ so that the larvae may hatch; these take three months to reach the state when they can fly. Red locusts have no fixed direction, but fly and stop in the hills and rarely come down to the pampas. Only if the pampas are very extensive will they spend the night there, but always in trees or thickets. Then
• [164] the Chiriguano gets up very early and puts in provisions for many days, and dysentery immediately appears in the town, carrying many to the grave.

Niguas are abundant where there are pigs and dogs, which they bother constantly. The nigua is a small flea in form and color, but not in its effects. It gets into the skin, causing a slight smarting. It is easy to get it out if its presence is soon noticed, but if it manages to establish its dwelling there and to make a nest, which consists of a small ball of skin, it is difficult to get it out. The nigua causes swelling and discomfort and makes walking impossible when it establishes its domain in one's feet. So that this may not happen, one first raises the skin around the ball with a needle, trying to get it out whole; ashes, especially cigar ashes, are deposited in the cavity which remains, and all danger of becoming immobilized for several days then disappears.

The guanaco is similar to the louse, but larger, and there are some of every size. In Chiriguano they are called
*[825] "Guanaco." These insects are also slightly buried in the ground, and they can easily bite one who goes barefoot or in sandals. They are abundant from Yvu to far beyond Santa
[164] Cruz de la Sierra. Their bite is not poisonous, but some of them do cause pimples or swellings all over the body, and in others the swelling is in the most immediately affected parts. The first of these effects was caused in a companion of mine, and he was later cured with five drops of ammonia in water; I had the second effect. It was during a trip, and since I had no ammonia, I cured myself of the swelling, which bothered me all day, with tender plantain leaves and melted grease, which an old woman in Guariri put on me. I spent the night there and woke up with no symptoms and no pain. The Indians chew tobacco and cure themselves easily.

/149 cont./

755 This done, they return to the town with an air of triumph
756 and pass through all of it, raining blows with their clubs on the
731 corners of the plaza and the houses of the most notable persons, and, the performance ended, he directs his discourse to those who surround him and the others who have come out of their houses. He tells them that they must not be afraid and that they should have confidence in him, for the illness over which he is the master has been dispelled.

He then takes a rest from his labors for several days, takes his leave of the cacique and the principal men, blessed by the frightened inhabitants, and returns to his town. Anyone can understand that, if there is no epidemic, it is a coincidence which will give considerable renown to the rascally impostor, and, if there is one, the blame falls on the townspeople or on some other /150/ bad sorcerer. Then he returns and becomes the healer for all of them. In smallpox epidemics the sorcerer is always one who has had it and who as a sad sign thereof has his face and his nose covered with pox.

755 In the first months after I arrived at the Santa Rosa Mission,
756 an epidemic began to break out; without my realizing what was
731 happening, exorcisms against the smallpox were being carried
164 out by the sorcerer Biringa, but as this disease had thoroughly invaded the town by the end of the year, he returned and paid well for his deceits; his threats that he would make the 255 male students of the school perish were of no avail since both they and the female students became sick, but only one of the boys and seven of the girls died (1).

> .. The girls of the Santa Rosa school numbered 735 in the year of the smallpox; those who were dangerously sick received the viaticum before they were taken to the lazaretto. Those about to die even received Extreme Unction in the lazaretto. In January of 1904 there were more than 500 persons in the latter.

/150 cont./

756 Even for rain the sorcerers perform their incantations with
789 their maize-husk cigar, making a turn in the planted fields.
731 but if the drought is general, the incantations are public per-
824 formed in the town in front of the house of the principal cacique.
[197] One of these was performed in the early days of the above-mentioned mission. The missionary had admonished them to stop it, but when they answered insolently, he formed or organized a commission with shotguns and old rifles. The three or four sorcerers fled, but one of them fell into the hands of the commission, was punished for his insolence, and in a few minutes a torrential shower refreshed the entire territory of the mission.

756 In concrete cases, when the sorcerer is required by a
755 particular family, he establishes himself in the house of the sick man; he asks him a thousand questions regarding the sickness, the houses that he has frequented, the friends with whom he has drunk, the companions with whom he has played, and the things that he has earned. Then he lights his maize-husk cigar and smokes, blowing the smoke over the body of the patient, especially the affected part.

Then, depending on the greater or lesser seriousness of the illness, depending on the nature of the disease, whether it requires blows or joltings, which is the most likely, he delivers them so atrociously that they are likely to end the patient's life, and if not he is content with rubbing the affected part hard /151/ and sucking it with his mouth, extracting from the patient's body the worms which the rascal has hidden in his mouth (1).

• [164]

1. In many cases worms can be found in the bodies of these Indians between the flesh and the skin. I myself, with the use of fenelina, have made worms as big as chickpeas come out of their bodies, without their having had any wound at all.

/712 cont./

736 very easily manages to make the milk come down. She
603 grinds watermelon seed or sarsaparilla root, Isipocagua, and
824 washes herself repeatedly, squeezing herself over or above her
853 breasts, and makes the famished child suck continuously for several days, and in a short time she achieves the desired result. Sometimes even young women lose their milk. They then look for the root and juice of the sámolo, or cipoi, wash the breasts with this juice, and succeed in nursing their children again (2).

2. In the confirmation administered by the Bishop in October, 1909, in Ivu Mission, an old woman of some 60 years of age presented her granddaughter, whom she had nursed. She is still alive, and so is the twin granddaughter, although not very strong.

Joy and Grief

855 For the Chiriguano race their joy at the birth of a male child is the same as at that of a female child, because if the former helps his father in field chores and in hunting and fishing, the latter helps her mother in household chores, and the father as much as the grandfather very much like to eat meal which has been ground by the hands /213/ of their daughter
765 or granddaughter. If either one dies, the grief that the old
855 people feel is very heavy. I witnessed many times a mother's agonies of grief over the death of her son and the profound feeling of the father over the irreparable loss of his idolized daughter.

799 What I am going to relate will better convince my
758 readers. In the month of July in the year 1909, a rabid dog
164 at the girls' school of the San Buenaventura de Ivu Mission bit Cecilia Yagúndai slightly and Ana Yarandui and Delina Aragúndai more severely. The two latter, younger than the

/213 cont./

797 first, came to me to be treated for their wounds, to which I
758 applied cotton soaked with ammonia, of which I also made
•164 them drink five drops. The two went through a high fever for four days, but they are alive. Cecilia did not consider her bite very important and did not come to me; I did not know that she had been bitten. She did not have a high fever either, because in fact scarcely any blood came out, according to what her companions say.

The month of January came, just six months after June, and the little girls who had been treated with ammonia again had the same degree of fever and recovered. The other girl began to be afraid of water and to be laughed at by her companions for this fear, so much so that she was the object of foolish tricks. She went down to the town, she wanted to drink water, was unable to, and she told her parents. At once she said that she had pain in her wrist, in her little breast, and in her shoulder, and nothing could be done to treat her; the sickness got worse and she received the last rites. The night before she died she tried to run out of the house; she howled without rest and tried to hit and bite her mother. In all, she had true hydrophobia, which carried her to the grave in three days (1).

> 1. The child Cecilia was bitten by the rabid dog right on her wrist, which is where the first pain began six months later. When I blessed her with holy water, she was afraid and shrank away.

Until she was buried, I did not know what had happened in the month of July, but when I saw such a similarity to rabies, I inquired and it turned out to be this which had
753 caused her death. Her parents, since they could not be
754 persuaded that the bite could produce an effect after so long a time, attributed her violent death to sorcery, stating that this must have been done by a young man who a few days earlier

/252 cont./

262 As very savory food there are also cicadas, ants, lizards, locusts, and some green worms which cause disgust just to name them. If a head of cattle dies and putrefaction has begun, the Chiriguano finds it excellent; give it to him and it is a grand gift, and that day is a carnival for him; he does not try to find out whether the animal died from the poison of a viper or rattlesnake or from rabies (1).

262
252

1. When Indians bring home the meat of dead cattle well into a state of putrefaction, they boil it in ollas and throw away the liquid, and in this way it loses much of its bad smell.

262
178 I do not know whether it is through superstition or because they are descendants of the Jews that this tribe formerly did not eat the flesh of the pig; although they like and hunt the wild boar or the peccary, they did not touch the domestic pig, but today almost all of them, with the exception of some women, eat it.

261
262 The Chiriguano suffers in times of hunger or scarcity of food, but he looks for food in the earth; this is very harmful food, which produces various ailments, such as consumption and
[252] dysentery. He looks for the potato of the serpentine arum, ex-
[164] tracts it, and, making a hole, heats it, throws the potatoes there, and covers it with ashes and embers, leaving them overnight; on the following day he and his family eat, but it gives them a bad stomach-ache, which makes them throw themselves down with their bellies to the ground until the pain abates; the same potato, raw, is efficaceous for killing worms in the galls of animals.

[222] Another food in times of scarcity is the Caraguata; this
[252] is a kind of aloe with leaves without the oily liquid; the edible part is the roots, which have a flavor like mandioca; it is considerable work to pull them out of the ground, where they are firmly attached, and the mealy substance is /253/ little enough; to eat it, it is roasted in the coals or under the ashes. When it is the time for fruits and wart threatens, the Chiriguano

/265 cont./

52
519

They spend the rest of the year in diversions, playing cards and shooting dice, hunting doves and wild animals, going fishing, or fishing where the large rivers are, organizing private drinking parties, today in one barrio, tomorrow in another, today in Mengano's house, tomorrow in Fulano's, the day after tomorrow in Sempronio's, until planting time returns once more.

The Indian concerns himself very little about his house, which sometimes is at the point of falling in on him: his house is better ventilated than a sieve, it rains more inside than out, he sleeps there almost like a toad, he sleeps on the damp ground or above it on a miserable cot, placed over the mud or the water, and his sleep is like that of the dormouse (1).

•[164]

1. This way of life in the dampness in their houses or outside of them is the cause of many skin diseases, fevers, and tumors.

Hospitality

574
576

The Chiriguano is very hospitable and it would be hard to find any other race which is his equal in this: he receives and serves everyone in his house, both whites and those of familiar condition, for example, the Toba, and, with greater reason, those of his own race. They visit from one town to another, and at the first meeting or at first sight they say immediately, /266/ depending upon the age of the person most Ndengpuama pa tati? good day, uncle, if it is in the morning; Ndecaaruma pa? good afternoon; or Ndepistruma pa? good evening. Literally, these three salutations have another meaning. The first mean "Have you reached this day, have you arisen healthy and vigorous?" The second, "Have you reached the afternoon?" And the third, "Have you reached the evening?" He who receives the greeting answers, Ampuama, checaaruma, or chepistruma, respectively.

/385 cont./

753 821 which rises continually to the sky on these interminable plains, taking behind it all of the trash that it finds along its way. It is called Curumino, and, according to them, it causes pains in the foot, knees, and bones. When a whirlwind begins in a town, they try to cut it with a knife.

164 Illnesses and Remedies

The most common illnesses among the Chiriguano are the intermittent fevers that are endemic, tuberculosis or consumption, eye disease, convulsive coughing, diarrhea, dysentery, mange or itch, and tumors accompanied by a kind of leprosy that covers a large part of the body. The intermittent fevers appear at the time of the first rains and continue until the time of the fruits and fresh maize. These fevers are not fatal, but one who is attacked by them has a rather afflicted life. Their remedies are vegetal: 757 they boil cushacha or algarroba bark, and they drink this water, but it does not always have a salutary effect. /786/ If a small dose of quinine is administered during the intermittent fevers, they immediately get well (1).

1. They get well with a small dosage, perhaps because their bodies are not accustomed to the remedies of the apothecary. Another efficacious remedy for the intermittent fevers is bitter coffee or coffee with a little sugar.

164 The itch, tumors, and leprosy do not cause death. 262 Chiriguano food is almost always tainted. They are not careful 263 in selecting it, and stinking meat does not disgust them. Their 951 water is not always clean; they bathe at any hour and, after bathing 95 do not dry their bodies. If it rains, they let the wet clothing dry 880 on their person. From this and other causes come the many skin

164 757 /The cold./ From this and other causes come the many skin diseases which do not let them sleep. The itch is cured with saltpeter found in the dry stream beds. They call it Curuyuqui, or salt for curing the itch, but the remedy does not always produce its effect. The itch principally attacks those of few years, and nursing infants catch it from their mothers. Lepers are cured very efficaciously by means of hot cow dung, and it is enough to apply it two or three times for a cure within three days without any further remedy, but they do not resign themselves easily to using this repugnant but efficacious remedy.

157

164 Smallpox and measles are epidemics which appear from time to times; for this reason I do not put them in the list of endemic diseases like the former ones. The Chiriguano runs from smallpox as a person with hydrophobia does from water, since through experience he knows that anyone who gets it has a hard time being saved from a horrible death. When it enters a town, it sows fear and desolation. Sick people resign themselves to death, and the healthy ones flee to serve to other tribes. It seems that it is not easy to attack smallpox directly, and up to now only vaccination has benign effects (7).

777 164

> 7. When smallpox breaks out, the missionaries go wherever their ministry is needed, like doctors and priests. Up to now none of them has caught it, perhaps because they are vaccinated or because they have different blood.

In 1910 the town of Cuevo, which is about eight kilometers from Tve, was decimated by smallpox. I vaccinated all the people of Tve and those who were not residents there. But the vaccine did not take in all of them, as occasionally happens. Nevertheless, few got sick and only two died. The remedy that I administered after the initial fever had begun was rather strong wine vinegar. The sickness ran its course only in those who had not drunk the /787/ vinegar or who had not been able to retain it in the stomach. I administered one cup every six hours three times, and it was enough for this terrible illness, which would cause so many deaths in Cuevo, to pass almost unperceived in the San Buenaventura Mission (1).

> 1. Many people became sick and died in the

/287 cont./

799
164

Santa Rosa Mission, but the use of the vinegar, which I began to administer later, made the mortality stop.

Measles usually attacks children, as does diarrhea, and because they are very delicate it is difficult to treat them, for which reason almost all of them succumb. Lemon and vinegar are efficacious remedies for both illnesses; in many cases I have administered camomile with good results. Diarrhea in infants comes from a scarcity of food, for then the mothers eat very hot things, such as the fruit or potato of serpentine arum, algarrobas, and other wild plants, as a result of which the infants drink the very hot milk, which damages their bellies and produces inflammation (2).

164
261

[757]

2. There exists near or around the lakes a herbaceous plant called pazote, and by the Indians and whites páico. A tisane made from this herb is efficacious against smallpox and measles.

Dysentery occurs in older people, and an occasional case of it shows up even in children. The cause of this illness is the very poor diet in times of want, when they eat wild roots and fruits. Here there is a very effective remedy, which the whites call meloncillo and the Indians Ñurantimburu. This is a thorny bush with long thorns, from which its name comes. At the time when it buds, or in the springtime, its thorns are slightly purple, and its roots are the remedy. They are boiled and the patient is given this water to drink for a week. The eye sickness attacks all, big and small, without distinction and is so bad that some lose their sight completely or are left with only one eye. In the missions this is treated with white lead or lead acetate, and it suffices to apply it two or three times to bring about a complete cure.

164
757

[797]

164

The convulsive cough, or whooping cough, is another illness which attacks children up to ten years old, causing many deaths. It shows up in the cold months and even in the rainy season, sometimes attacking grown-ups, among whom it does not cause death. There is in the hills a yellow flower which around here is called

[757]

164 757 /287 cont./

vira-vira. The tisane made from these flowers has salutary effects, but it is not strong enough to bring about a radical cure, /288/ especially if the precaution of wrapping the child up after the potion is drunk is not taken (1).

1. Most effective for whooping cough is the use of petroleum. The child is anointed from his forehead to his belly and made to drink a few drops. In 1910 almost all of those whom I treated with petroleum got well.

164 Consumption, or tuberculosis, attacks men and women and appears in both sexes as a stomach-ache. This pain can be considered the beginning of the sickness, which usually appears after the age of 40, but in certain places it carries to the grave persons who have not yet reached the age of 20.

In the Santa Rosa mission this disease alone, in less than ten years, caused the death of more than 70 schoolgirls: at that time this mortality was attributed to the bad water there, but as it is found in other places where the water is excellent there must be another cause. For young people or adolescents it could not be the continual fires, because there are none in the schools.

164 291 755 The Chiriguano has no remedy for tuberculosis, and one who gets it is resigned to death, because whether or not he attributes everything to sorcery, he believes in it and in the poison in this case: hence the sick person goes for help to the sorcerer, who to get rid of the illness, without succeeding, uses atrocious and even immoral means when dealing with women (2).

[799] 2. The missionary buys remedies from the apothecary to treat the Indians. These remedies are almost always repugnant. If the sick person does not drink it in the presence of the missionary, he will pour it out: he has more faith in the sorcerer.

/389 cont./

Other Illnesses and Remedies

759 According to the illnesses that exist, there are doctors and medicines among the Chiriguano. The former have not gone through any university other than experience, learning from the latter to prepare medicines, not only from plants and herbs, but also from minerals and even from the excrement of animals. The doctors receive the praise of individuals who know less than they and are differentiated even by name from the evil sorcerers, who are called Mbaecué, while the former are called Ipaye, and the medicines or drugs are called Mba.

759 The oil that is necessarily a side product of the preparation of chicha is very good for curing headaches. Salt, ground and mixed with the urine of infants, is drunk and is a good anodyne for stomach-aches. Dampness and cold produce a tightening of the nerves, which causes atrocious pain in more /759/ than one person. To cure this disorder they pull up a branch of ulale /a cactus/, Nasrapiina, strip off the spines, parch it, and, when it is good and hot, apply it to the affected parts and get well. They use something else to cure dysentery. They burn yellow maize, grind it with watermelon seed, and have those attacked by the disease drink it (1).

> 1. The melencilla /little melon/ is a remedy which the whites told me about. It is more effective, but the Chiriguano have no faith in it or do not use it out of weakness.

When a sick person suffers a pain in his side, he asks for a hulled-armadillo shell, grinds it up, and drinks it. At the same time what is left is heated at the fire and applied to the pain, and it stops as if by magic. If measles comes out on the lips, the sorcerer or doctor applies a tick which has been taken off some dog's flesh, and thus it disappears. Sometimes tumors or a swelling in the throat and in the knees appear, and these are made to disappear through the application of the herb called Urucina. It is heated at the fire in a small olla and applied. Another herb, called Yandurimbó, is also good for this. They

• [14]

/157 cont./ One old woman who was
supposed to know Chané very well said she would teach me after
she had reached the realm of the dead. Since the Indians in
this happy place are not bothered by whites, and not by eth-
nographers either, the promise of the old woman was not very
friendly.

The Chané use their old language for many expressions
that are abusive, for example, karaimabyti, which they trans-
late as son of a w---e. An invitation to coitus is called
pacône. There are also songs in their /158/ old language, for
example, siparakinkoyé, siparakinkoyé, siparakinkoyé,
sandya, sandya, sandya, which they did not know how to translate.

From the Rio Parapiti I again visited the Chiriguano chief
Tamiri in the Caipipendi valley, where I sought to buy as many
old ornaments and other valuables as possible. Besides Tamiri
I also visited another chief, Tumbey, an old worthy who was
always embracing me and saying: "I am Tumbey." /Fig. 77
appears here./ "Yes, the great, mighty Tumbey," I chimed in,
which made the poor reduced fellow feel very flattered.

From the Caipipendi valley I went by way of Pipi to the
mission at Ivo. This lies in an arid, lonely region with little
water, near several huge mountains, and the life there must be
dreadful. When smallpox was very prevalent in the region,
Father Bernardino successfully prevented the disease from spread-
ing into the mission by vaccinating all the Indians living at the
place. Father Bernardino is a truly unselfish human being, a
genuine missionary. As a result of the vaccination, no one in
Ivo died of smallpox, whereas the sinister disease raged fright-
fully among the whites a few miles from the station. It almost
served them right. If anyone died of smallpox, the corpse was
laid on a table decorated with paper flowers and a crucifix.
Around this the other twine -ould get drunk and /159/ continue
to drink obligo (1) until they were finally lying on the table.

1. If a person drinks obligo with another, the
latter must drink up.

/159 cont./
In the village of Cuevo alone 60 out of 200 persons died within a short time. I visited the 140. They were as gay as ever. Spirits and beer were consumed in quantities. 114 [64] [65] [273]

Father Bernardino was never given credit for this work, but rather the medicine men, who had bewitched the sickness so that it would not come to Ivu. The white colonists, too, occasionally had the medicine men come in order to /Fig. 78 appears here/ drive away the sickness. They did not believe in the vaccine either. 797 756

With Ivu as the starting point, I made a trip into the 114

415
531

Fig. 77. Clay vessel made by the wife of the Chiriguano chief Maringay. 1/6.

Igüembe valley, in order to visit the Chiriguano chief Maringay. 114 It was a charming ride on horseback up on the high crests and down into deep valleys, through an often grandiose, colorful landscape. These valleys are poor in forests. Only in a well-protected ravine in which a brook trickles forth is the vegetation luxuriant. [133] [137]

I soon became very good friends with old Maringay. The old man was conservative, clung to the old customs, and felt that the Indians should be on good terms with the whites, but should preserve their old habits and customs unchanged. His village was extraordinarily interesting and very rich in old, fine things. 123 157 173 643 000

C 165 /215 cont./
President Belzu in Sucre. The latter governed between 1848-1855; thus, 100-year-old Maringay is obviously not more than about 80. An 80-year-old Indian is therefore the oldest of his tribe.
C 145 Among the Indians one almost always sees /Fig. 112 appears here/ that the one who has grown-up grandchildren is very frail and senile and stands at the brink of the grave. Indian men and women mature very rapidly, but also age quickly. At 50 the Indian is an
C [114] old man, at 70 a so-called centenarian. Im Thurn (1) likewise

1. Im Thurn, op. cit., p. 190.

believes that the Indians do not grow old. /216/ He thinks that they seldom reach an age older than 40 or 50.
C 142 Maringay's hair was slightly gray. There are some Indian men and women whose hair is almost whitish yellow, but they are
C [145] rare (Fig. 112). I never saw a bald Indian. When they are older,
C [164] their faces are deeply furrowed. Not infrequently they become blind in old age, less often deaf.
Ee 142 515 Among the Choroti and Ashluslay the appearance of old people is often frightening; they are dirty, emaciated, and bleary-eyed. This is not the case among the Chané and Chiriguano. These Indians know how to grow old in beauty, and even the old people keep themselves nice and clean.
Ee 756 If the Chané or Chiriguano Indian becomes seriously ill, the medicine man is sent for, as among other Indians.
The Chiriguano and Chané distinguish between two kinds of medicine men, whom they call "ipáye" or "ipáyepótchi." The
Ee [754] former are good and lift the spell; the latter are able to lift the spell and to bewitch.
C 756 797 I once jokingly asked a Chiriguano whether Father Bernardino in Ivu was an "ipáye" or an "ipáyepótchi." The Indian answered dutifully, an "ipáye." The position of the missionary among the Indians is that of medicine man; he assumes their power and their influence.
Ee 756 177 In the preceding I said that the whites in the vicinity of Ivu sent for an Indian medicine man to drive away smallpox.

/78/

Statistics

161 The tribe is in complete decadence and in a few more
162 years will be entirely lost. At the beginning of the nine-
[181] teenth century, that is, before the war of South American Independence, in the Tarija missions alone there were more than 23,000 souls, and nevertheless that number did not include any of the numerous towns existing between the two large Parapiti and Pilcomayo rivers or the Indians of Caipipendi, Choreti, Pipi, and others located south of Lagunillas. At that time, I can state that the Chiriguano numbered more than 200,000, inasmuch as, according to the statistics of Father Lozano, the adult men fit for war, without counting women and children, numbered from 25,000 to 35,000.

167 Although Father Lozano was referring to the beginning of the eighteenth century, the difference must have been slight, because at the beginning of the nineteenth century there was not felt as there is today the emigration to the Argentine Republic, which began when the territory was opened to trade with the founding of towns of white Christians, which there are now in great number, up to the founding of large provinces with the names of Acero, Cordillera, and Gran Chaco, nor was there so much immorality as prevails today (1).

1. New laws have been made which make recruitment for Argentina impossible, and Dr. don Justo Padilla, the present national delegate from the Gran Chaco, at the present time does not allow the law to be merely written; he lets nobody through.

165 Epidemics, vagrancy, and emigration more than any-
161 thing, in addition to scarcity of provisions, are destroying this race, which is greatly needed and will be needed later for agriculture and cattle-raising in the provinces which have been mentioned. Today there is already a need for farmers.

/112 cont./

142 The Chiriguano at the time of birth has a color which is difficult to define, but, and let nobody laugh at this, his color is that of newborn mice, and as he grows the color changes until it is that of sunburnt parchment. The causes [147] of this change are the tropical heat, the sudden winds and changes, and the burning sun, to the action of which they expose themselves with untoward pleasure, with no bother and without fear, even should they be but tender infants.

144 147 From this it can easily be deduced that the Indian does not fear the canicular sun, or heat either; he works on the hottest days without shirt, trousers, or anything which re- [291] sembles these; he stretches out full length, very content, [516] receiving on his back the rays of the firey sun, and nothing daunts him. But when the north wind changes to the south and consequently the cold begins and the frost comes, he is very cowardly, and it is hard to make him work well and happily; in such cases it is easier to suspend the work for a few days, not to pay the laborers anything at all, and not to get uselessly angry; but this can only be done when the suspension does not have any bad effects (2). /Illustration appears here./

2. It is not only the Chiriguano Indian who hates the cold, but also the other races of America, such as, for example, the Quichua /Quechua/, according to what the historian Robertson says.

• 165 /113/ Life Span

The Chiriguano normally lives a good many years; he is little affected by heat, cold, and the inconstancy of the climate, nor by drunkenness and self-indulgence, to which capital vices he abandons himself from a tender age. Some [145] reach and pass 100 years, judging their longevity by their hair, since their hair does not turn white except at a very

[Text Continues on P. 156]

/113 cont./

165 [145] advanced age. and I have seen Indians with the head completely white. and others with a white the color of smoke or something smoked. In the performance of my ministry I have met and baptized many centenarians at the time of their death. and in the towns through which I have passed I have met several who fought in the Caraparí war and who witnessed the War of Independence.

293 276 [178] But today the Chiriguano has degenerated greatly: in somewhat distant times they did not know about either liquor or coca. and today both are general. and because of liquor and coca. the use of which they much abuse. they ruin their health and shorten their existence. Much youth disappears with the abuse of these substances. and as a general rule in the missions the best disappear. those who know some art or have some fortune: all that they earn. after buying their clothing (although not always). they invest in liquor and coca. and [165] [248] thus shorten their lives. I have seen towns where out of 40 or 50 young men of the same age there are scarcely two or three alive who will reach 50: it can thus be seen that the drunkenness produced by chicha is not so pernicious as that of liquor or alcohol. for which any tax imposed on them by the Supreme Government is never too much. and would that such a tax were higher. more general. and that it was not felt to be enough simply to write it out. In spite of this dissipated life. it is [142] [149] very rare that one encounters a bald Indian. which indicates great robustness (1).

1. I have known many large and small Chiriguano towns: I have only found three semibald persons.

Morality

181 At present the Chiriguano Indian differs slightly or not at all morally from the common mass of men. I mean that not all are good nor are all perverse: there are good ones and bad ones

/211 cont./

853 262 There is no special food or more abundant food for mothers after childbirth. She who gives her breasts to her little one eats little and extremely poorly. Her ordinary food is parched maize, parched maize meal, bread made of the same, herbs, beans, gourds, other things of this nature, and rarely a little purchased beef, other meat from animals that died from sickness, lack of pasture, or snake bite, and, finally, game or chicken. In spite of this extremely bad food, milk is abundant in her breasts; the children are almost always hanging from them and sucking and never seem to dry them up, which indicates that they are excellent nursers.

648 464 853 Mestizo or white mothers who sometimes have little or no breast milk because of sickness or some accident make contracts with Chiriguano mothers, pay them well, and treat them better, but it seems that continued good and satisfactory nursing harms them, /212/ it also being prejudicial to the breast as well as to both newborn babies, the weaker child succumbing first (1).

1. Naturally the Chiriguano women refuse to be wet nurses for white children, because they abhor them. When through experience they learn of the sad consequences, communicated by others, they resist even more and only do it when force or the right of the stronger prevails.

845 [163] [165] Twins

Multiple births are rare, and those of two children are frequent. In the former case the newborn babies die very soon, and in the latter case one almost always lives, and many times 736 603 both live. When twins survive or through the death of the mother a newborn child is left an orphan, it is very easy for the grandmother to care for one twin or the orphaned child. [853] [824] Although the old woman may have reached or passed 60, she

581 This Jesuit priest describes the marriages of the Chiriguano, however, as very loose.

581 273 With marriage, life begins in earnest for these Indians. It consists of work and drinking maize beer. I have already described their work somewhat; I shall discuss their drinking bouts below.

165 The life of the Indian men and women passes more quickly

142 291 516

Fig. 112. Old woman. Rio Itiyuro.
Her grandsons were about 18 years old and younger.

165 than that of whites. The age of the Indian is very difficult to determine when one has no definite figures to go by. Maringay told me that he was the oldest of his tribe, that none of his contemporaries was living any more. The whites said that Maringay was over 100 years old. This is exaggerated, however. As a newly married /215/ youth 16-20 years old, Maringay visited

C 165 /215 cont./
President Belzu in Sucre. The latter governed between 1848-1855; thus, 100-year-old Maringay is obviously not more than about 80. An 80-year-old Indian is therefore the oldest of his tribe.
C 145 Among the Indians one almost always sees /Fig. 112 appears here/ that the one who has grown-up grandchildren is very frail and senile and stands at the brink of the grave. Indian men and women mature very rapidly, but also age quickly. At 50 the Indian is an

believes that the Indians do not grow old. /216/ He thinks that they seldom reach an age older than 40 or 50.

C 142 Maringay's hair was slightly gray. There are some Indian men and women whose hair is almost whitish yellow, but they are C [145] [164] rare (Fig. 112). I never saw a bald Indian. When they are older, their faces are deeply furrowed. Not infrequently they become blind in old age, less often deaf.

Ee 142 515 Among the Choroti and Ashluslay the appearance of old people is often frightening; they are dirty, emaciated, and bleary-eyed. This is not the case among the Chané and Chiriguano. These Indians know how to grow old in beauty, and even the old people keep themselves nice and clean.

Ee 756 If the Chané or Chiriguano Indian becomes seriously ill, the medicine man is sent for, as among other Indians.

The Chiriguano and Chané distinguish between two kinds of medicine men, whom they call "ipáye" or "ipáyepótchi." The Ee [759] former are good and lift the spell; the latter are able to lift the spell and to bewitch.

C 756 797 I once jokingly asked a Chiriguano whether Father Bernardino in Ivu was an "ipáye" or an "ipáyepótchi." The Indian answered dutifully, an "ipáye." The position of the missionary among the Indians is that of medicine man; he assumes their power and their influence.

Ee 756 177 In the preceding I said that the whites in the vicinity of Ivu sent for an Indian medicine man to drive away smallpox.

/12 cont./

C 144 [177] Chiriguano and Chané no longer exist. "The physiognomy of the latter was completely identical to that of the former" (45).

45. Moreno II, p. 254.

C 114 141 [113] In addition to anthropological measurements made on four Chiriguano by Ten Kate (46), Robert Lehmann-Nitsche

46. Ten Kate. Herm.: "Matériaux pour servir à l'antropologie des indiens de la République Argentine /Materials for use for the anthropology of the Indians of the Argentine Republic/." Revista del Museo de la Plata. Vol. 12. La Plata. 1904.

in 1906 had the opportunity at the San Pedro de Jujui sugar mill to take the anthropological measurements of 40 Chiriguano men and ten women, who had come from Bolivia to work at that mill. Entitled "Estudios antropológicos sobre los Chiriguanos, /Pl. III-IV appear here/ /13/ Chorotes, Matacos, y Tobas (Chaco Occidental)" (47), Lehmann-Nitsche has

C [113] 47. Anales del Museo de La Plata. Vol. I. No. 2, (Second Series). Buenos Aires. 1908.

published the results of these measurements, together with measurements of other Indians, and added to that publication in the first 12 plates Chiriguano types photographed by Carlos Bruch. In addition to the somatic measurements, determination of skin color, eye color, and hair color and form have been published by Lehmann-Nitsche. Thirty-six of the 40 Chiriguano men stated where they had lived, and from this we know that these people had come from various regions of Chiriguano territory to the San Pedro sugar mill. There were some who had come from the northern regions, and one had come from the city of Santa Cruz de la Sierra. Others had come from the south of Chiriguano territory, for example, from the town of Carapatí, located considerably to the south of the Pilcomayo River. There are named 13 Chiriguano

C 166 C [167]

[Text Continues on P. 30]

/13 cont./

166 towns from which one man had come from each one. From Charagua, Parapití, and Carapati two had come from each one, four from Ingre, five from Santa Rosa, and eight from Machareti. Unfortunately, the native soil of the Chiriguano women was not stated, and it is only said that they came from Bolivia.

141 The average height of the Chiriguano men measured by Lehmann-Nitsche is 163.4 cm., and the height of the Chiriguano women measured is 151.7 cm. This average height of the women measured is not a little less. The average height of the eight men from Machareti was only 161.8 cm., and that of the two men from Parapití only 158.1 cm. But the average height of the four men from Ingre was 169.15 cm. The tallest of the Chiriguano men measured, who had a height of 178.6 cm., had come from Ingre, and the shortest, with a height of 153.5 cm., from Machareti. The smallest woman (between 35 and 40 years old) was only 143.0 cm., and the tallest, 158.0 cm. These numbers show us that the height of different Chiriguano individuals is quite variable. Among the Chiriguano measured by Lehmann-Nitsche, the number of those who came from the same region is too small to be able to make exact deductions about the differences in height of the Chiriguano of the various regions in order to be able to clearly demonstrate the somatic influence of mixture with other tribes.

14 The photographs of Chiriguano types published by Lehmann-Nitsche show great variations among the different features and bodies, which corresponds to the fact that the present-day Chiriguano are the product of a mixture of various ethnic elements.

113 114 142 Good photographs of the Chiriguano of the southern part of their territory can be found in the publication of von Rosen, Ethnographical Research Work during the Swedish Chaco-Cordillera Expedition, 1901-1902 (48). Erland von Nordenskiöld

/Since Métraux believes that the Chiriguano are actually descendants of the Guarani, early culture history of the Chiriguano, in regard to their migrations and relations with other groups with whom they came in contact, will be found in category 116, pp. 1-30. Much of the material in these pages has been subheaded for Guarani SM6 but if the author's contention is correct then the data contained therein may equally apply to the historical Chiriguano./

/201 cont./

/fn. 7 cont./ from the corocotoquys to the [illegible] two, and near them are the curumanos and [illegible], and from there they take a four or five days' journey to the carcaras who are the masters of the metal, and together with them are the [illegible] who similarly are the masters of the metal." Normally the "maya" concerned in some of these lists are the Mbayá /Mbaya/ of the Guaikurú /Guaicuru/ family.

/202/ This infiltration of objects probably lasted a very long time before the Guarani had the idea of going themselves to get them at their source. Notions about the Inca Empire, at first vague and uncertain, must have become more precise little by little and must have increased their desire to know with their own eyes the fabulous men and countries which produced so many beautiful and strange things. We must imagine the attitude of the Guarani Indians toward the populations subject to the Inca as being /203/ in every way similar to that of their descendants, the Chiriguano, and the present-day small tribes of the Chaco with respect to the white men. There are still tribes who have never seen them, but who already possess iron objects whose importance in the struggle for life they appreciate fully. I have in my collections two Tairabus burins whose points are of iron, and yet these Indians have never seen a white man and probably have scarcely heard of them. If there is a chance to be able to approach without danger half-breed or creole villages, they will do it. Thus it is that we have each year a temporary migration of thousands of Indians toward the ingenios (sugar mills) of Argentina. Among the numerous tribes which make their way toward the sugar-cane plantations, there are perhaps many who had never had any direct contact with the white men to whom they are going in order to seek an easing of their lives and an improvement in their material conditions. By leaving for the Chaco and the Andes, the Guarani thus obey the same aspirations as these poor Tiwanaku (Chiriguano) whom one meets in autumn on the highways which lead to Argentina.

G 175 484 648 [262] G [271] G [721]

/311 cont./

Elsewhere (Hernández, p. 341): "The Spanish, taking with them as guides some Indians and several individuals who said they knew the way, walked for thirty days across deserts where they suffered very much from hunger and thirst, to such a degree that some Indians died ... they returned eating wild thistles all the way. For something to drink they extracted the juice from these thistles and other weeds."

"Aracare ... ordered them (the Guarani who were accompanying a Spanish expedition into the Chaco) to set fire to the prairies they were crossing, which was the equivalent of warning the enemy Indians whose territory they were going through to come and bar their way and kill them. They did that against the custom and discipline observed by those who make expeditions in this country and against the practice of the Indians themselves." (Hernández, p. 228.)

A Guarani from Puerto de los Reyes, who had taken part in an expedition to look for metal, reported to Irala "that he had heard it said that they took five moons before reaching the place where the metal was, and he added that the ones from Itatin who lived more than a hundred leagues lower asserted that they took no more than three months and claimed that they made this trip in five months since they had to pass so close to the spot where their homes were. He said that what he was claiming was the truth, but that the duration of this trip was due to the fact that they often stayed to eat in regions which appeared fertile and that during the time he was with them they stayed in one place three months and that this was why it took them so long." (Relación de Domingo Martinez de Irala, p. 350.)

G 175 167 721 C • 167

Against the frequency of these warlike expeditions of the Guarani, there /312/ will be raised the objection of the insurmountable obstacles the Chaco presents, the unprecedented difficulties the Europeans had in trying to cross it, the bloody sacrifices all the expeditions risking it must have made. I shall reply by reporting the account of a contemporary migration made to me by my old friend and host, "Captain" Taruirí of Caipipendí. Some years ago, old Taruirí, having learned

169 [464] /312 cont./Some years ago, old Taruirí, having learned from some Chiriguano that Brazilians were "carifiosos," that is, generous, had the idea of going to their country to find work, for which he hoped to be well paid. He banded together with 45 other Chiriguano before whom he held out the glittering fortune which awaited them in the country to the east. With this adventurous spirit and boldness which characterize the Guarani, they did not hesitate to take off toward the unknown. They first passed through Chané territory and followed the course of the Parapiti to the desert. There they rushed boldly into these unexplored regions, dried-up expanses, which separate the Izoxoc from Chiquitos. They were all armed with bows and arrows to defend themselves from a possible attack by the Tsirakua, the tracks of whose squared-off sandals they often saw in the sand. No water, of course, but only sipóy roots, which permitted them to stand the thirst. After 12 days of walking, this band arrived at Chiquitos, then from there reached the Paraguay River and Corumbá. Taruirí was not a little surprised to find brothers there, "that is," he explained to me, "people who spoke my language, badly it is true, but who nevertheless made themselves understood." When I inquired discreetly as to the success of his business over there, Taruirí answered, shaking his head and in a tone shot through with sadness and disillusionment: "All that was only a lie," todo era engaño.

[291 [324] Taruirí does not know and will never know that by doing this he accomplished an exploit that would be the pride and glory of an explorer. For him, it was a question of a simple trip, scarcely longer and more arduous than the one he undertook in the past to go to Argentina.

173 539 648 484 Does anyone want other modern examples of their spirit of adventure and of that ease with which the Guarani move about? I transcribe as such the curious tale told to me by the Indian Cipriano from the Ivu mission, who, confused as he may be, refers to definitely authentic facts:

C
G
175
484

/313 cont./ The exploration of Alvar Núñez Cabeza de Vaca, continued by his lieutenant, Francisco de Ribera, is a second example that shows very well that the excursions of the Guarani did not constitute exceptional deeds that were extremely dangerous to accomplish.

Having arrived at a certain distance from the spurs of the Andes, the Guarani entered the territory of the Chané Indians.

It was in one of these numerous warlike ventures of the Guarani that the Portuguese adventurer Alejo García took part with several other comrades.

C
G
175

484
[162]

I am convinced that the 2,000 (according to Díaz de Guzmán, p. 26) Guarani whom this adventurer accompanied as far as Peru formed only one of the numerous bands of warriors of this nation who, each year, from every point of the Guarani territory, used to cross the Paraguay River, then the deserts of the Chaco.

C
G
114
175
167
484
174

Ruy Díaz de Guzmán, who reports this event, sees things in too simple a light. A migration is not made at one time nor in one year. That of the Guarani lasted perhaps several decades, without, however, necessarily speaking of centuries. Twenty or thirty years must have sufficed for the nucleus of the Chiriguano nation to form between the upper Pilcomayo and the Guapay River. The penetration of the Guarani into /314/ the Chaco took place in a rather chaotic and incoherent fashion. The conquistadors were continually meeting on their route Guarani groups who, for one reason or another, could not succeed in joining their brothers established beyond the Chaco. These Guarani, who blazed the trails followed by the invaders, were valuable guides for the Spanish adventurers, and they were the ones who led them to Peru. For long years there were uninterrupted communication and incessant coming and going between Paraguay and the eastern slope of the Bolivian Andes.

C G 175 167 /314 cont./

Making a critical study of Alejo García's story would be to follow paths already traced out and, besides, to leave the province of ethnography. This episode of the Conquest, so closely mingled with an ethnic phenomenon, appears today as a major event whose repercussions on the development of the Provinces of the Río de la Plata were considerable.

C G 175 167 721 726 I 726

Alejo García's expedition is distinguished from the preceding ones by its scope. Not content to raid the Chané, the Guarani Indians who formed this column had the audacity to attack the Inca fortresses of Cuzco-Toro and, after taking them by storm, to penetrate as plunderers into the provinces under the authority of the Peruvian emperor. The invaders crossed the frontier between Mizque and Tomina and advanced 40 leagues into the interior. Near the villages of Presto and Tarabuco, not far from Chuquisaca, they were stopped by the Charcas Indians, according to Díaz de Guzmán, by troops raised in the Kontisuyu, according to Peruvian chronicles. The Guarani withdrew in good order, without abandoning the conquered booty.

C G [729] I [712]

Huayna Capac, following this invasion which took place during his reign, had the destroyed forts restored and put strong garrisons in them.

C G 176 721 726 I 726 901 C G [291] [266]

The Guarani invasion into Tahuantinsuyu is reported at the same time by the chroniclers of Paraguay and those of Peru (1).

1. Sarmiento de Gamboa, pp. 109-110: "While Guayna Capa was occupied in this war with the Cayambi's, the Chiriguanas, a mountain people, naked, and who eat human flesh and have a public slaughter house for it, joined together and, coming out from the harshness of the mountains, entered the land of the Charcas, which had been conquered by the ingas /Incas/ of Piru /Peru/. And they fell on the fortress of Cuzcotutyo, where the inga had a large garrison of frontier troops against the Chiriguanaes. And as they suddenly sallied forth, they entered the fortress and killed them all and among those of the land.

/314 cont./

for they returned, fleeing." /Translated from the Spanish./

They agree /Plate IV appears here/ /315/ on the essential fact and on the approximate date of the event. This coincidence between traditions whose sources are so different and which have been collected independently from each other in regions as far apart as this leaves absolutely no doubt about the purely historic nature of this invasion. Nordenskiöld (5, pp. 70-77) in the course of his last trip into the Chaco (1913-14) was able to study the ruins of the small forts of Cuzco-Toro (today Incahuasi), which always stand at the edge of Chiriguano country. By their style they belong to the Inca period. Nordenskiöld (7) and I had thought that García's expedition was the first in date that the Guarani had launched toward Peru. In reality, other Guarani emigrations preceded it by several years, as Gandía (2, p. 30) (1) succeeded in /316/ establishing.

1. Gandia (2, p. 30, note 1) cites various passages taken from old, reliable documents which seem to indicate that Garcia's expedition had been preceded by other previous migrations which, starting from Paraguay, had ended up in the establishment of Guarani groups beyond the Chaco. Thus the Tarapecoci recounted to Francisco Ribera how in ancient times, before García, the Guarani had come to plunder and massacre them.

A Relación anónima /Anonymous Account/ of 1545 (pp. 310-311) reports in these words the remarks of some Chané Indians who were questioned by Alvar Núñez Cabeza de Vaca at the time of his expedition on the upper Paraguay: "among the people found there are certain yndios /Indians/ who are from the interior country, those of the chane people

/fn. 1 cont./ who came to us themselves and others from near their land, and what they say agrees with what this one or that one tells us, and they say that they were slaves of a xristiano /Christian/ who came from the island of santa catalina and demanded gold and silver and they say that he got them from a race of carioes who took them for slaves and it was said the xrisptiano garçia, etc." /translated from the Spanish/. This passage seems to indicate that García and his companions found Guarani already established at the foot of the Andes and that the latter had already reduced Chané groups into slavery.

The most significant of these texts is the one we find in the Relación de Domingo Martinez de Irala, pp. 346-347. Irala was at Puerto de los Reyes on the Paraguay River when "on the brigantine where he was, there came a principal with three other yndios /Indians/ who spoke the guarani language just like the guaranis themselves; the said principal said that he is called theroçe, and one yndio of those who came with him, who was small in body, said that he was called xagoani and the guaranys called him maraana; without being asked anything, he said he had lived and had been a slave without pay /esclavo de gracia/, that the yndios named him maratya and called him by the two names; he and the said principal and all his house were not from the said port and they were the ones that were called chanes; asked through the said languages why they were called chanes, he said they were of the race of the chanes who were in the interior land and who are called çeritocoçi and that thus among the

/315 cont./

C G 175 648 Ce 175 648 567

/fn. 1 cont./ said chanes each pueblo had its name, although all were one race; asked how they came to speak guarany and where he knew the said garçia, he said that the reason he spoke goarany was that in times past, before garçia came from brasil /Brazil/ to the said guaranys, there was a great gathering of said guaranys in the port called ytatyn, in order to go to search for the metal, and that passing through their land at night they came upon their houses and killed many of them and took their women and children and brought them to the said port of ytatyn, and while they were slaves of the said goaranys in the said port, the said garçia passed through there, with whom he and two other brothers went in search of said metal with the said guaranys; asked if he went and traveled with the said Garçia until he returned, he said yes; asked how far the said garçia had gone and where he got the metal that he carried, he said that he had gone as far as the race that they call payçunos, and that the chanes and the said payçunos gave him the said metal and that he had returned from there because he learned that a race called çorocotoquis were having a great gathering against the said garçia and those who went with him; and he said that they returned to get more xrisptianos in order to return with them for the said metal ..." /translated from the Spanish/.

C G 175 127 114 ● 167

This testimony and some other indications corroborate Gandía, who in this study gave evidence not only of vast erudition but also great sagacity. There is nevertheless one point on which I do not agree with him. The documents alluding to the migration of the Guarani all speak of it as a recent event whose details were

/315 cont./

G
114
127
175
167

/fn. 1 cont./ still present in everyone's memory. Even if we accept Garcilaso's version and make that event go back to the reign of Tupac Inca Yupanki, it is still no less certain that it could only have taken place in the last decades of the 15th century. It is indeed at this time, according to Balboa, that the emperor Tupac Inca Yupanki would have reigned. (See Nordenskiöld, 6). In this case the first Guarani migration would have preceded García's trip by about 50 years. Why then does Gandía, who himself gives us this figure, consider it more probable that this invasion took place more than a century before the Conquest? When I personally submitted to Mr. Gandía the reservations I had on the subject of the date he was assigning to the establishment of the Guarani at the foot of the Andes, he answered that he had taken as a basis for this evaluation a passage from Lozano (Descripción chrorográfica...) and Mendiburn (Diccionario Histórico Biográfico del Perú...). According to the latter the Inca Yupanki would have died in 1453. I shall reply to this objection by stating that the evidence of Lozano, who was satisfied to copy Garcilaso, has no value; and as for Mendiburn's calculation, I do not grant him any credence.

One single fact remains certain in this controversy: The Guarani had begun their migratory movement toward Peru some years before García's adventurous trip.

G
175
167
[114]

/316/ establishing. Neither was Alejo García's expedition the determining cause of the great migration of which Díaz de Guzmán (p. 29) speaks thus:

"Following these events (García's trip) the Indians of the Province of Paraguay met together with their caciques and

/316 cont./

C G 175 167 decided to make an expedition and go back to the region where Alejo García had gone. When they had summoned many Indians of this province, they started going by bands and tribes. The Indians from below, the ones from the Paraná, followed the C G 131 175 167 course of the Araguay River, which is, as I have said, the Pilcomayo. These are the Indians who today live on the borders of the Corregimiento de Tarija: the Indians who lived in the region of Asunción entered on the right of the Paraguay River in the direction of Caáguazú. The Indians of Jeruquisaba and Carayazapera who were living higher up on the river left it near San Fernando. The latter are the ones who today are established on the Guapay River /317/ 20 leagues from the city of San Lorenzo, government of Santa Cruz da la Sierra."

G C 175 167 648 In the commentaries of Alvar Núñez Cabeza de Vaca (Hernández, pp. 299-301), it is a question of another migration which does not appear to have any relation to that of García, which was several years later. I shall quote this passage in its entirety, for it illustrates well certain vicissitudes of this great ethnic movement: Alvar Nuñez Cabeza de Vaca had sent a Spanish detachment to the Xarayes Indians to try to confer, with them as intermediaries, with a group of Guarani Indians who had settled a short time before in their neighborhood. The emissaries failed in their attempt, for Xaray and Guarani were irreconcilable enemies. By way of consolation, the Xaray cacique had put them in touch with a Guarani Indian, married to a Xaray woman, who had lived among them for a long time. "This Indian, who belonged to the Guarani race, had been in the villages of the interior of the lands and /318/ knew the roads which led there." The Guarani was invited to accompany the Spanish detachment and, interrogated before the Governor by interpreters, he declared "that he was a Guarani, originally from Itatí /Fig. 1 appears here/ on the Paraguay River; that in his youth his people summoned and made a great levy C G of Indians of all the land and went toward the land and the [721] villages of the interior. He himself had gone there with his [726] father and his relatives to make war on the natives of this region.

[Text Continues on P. 41]

C G /319/ They took from them the gold and silver plaques and ornaments they had. As soon as they arrived at the first villages they began to make war on the inhabitants and to kill many Indians. Many villages were laid waste and the inhabitants withdrew toward the interior. Then all the tribes of this land joined together and marched against his people, put them to rout, and caused great carnage. The others fled in various directions and the enemy Indians followed them, barred their way, and massacred them all. Scarcely 200 were able to escape out of all those who had left and who were so numerous that the fields were covered with them. He himself was among those who escaped. The greatest number of escapees stayed in the bush through which they had passed and settled there, for they had not dared retrace their steps for fear that the Guaxarapo, Guato, and other tribes would exterminate them. He himself had not wanted to live with them and he left with those who decided to continue their march. On the way they were seen by Indians who assailed them at night and killed them all. He had hidden in the thickness of the copse and, slipping through the underbrush, he had arrived in the country of the Xaray, who had taken and adopted him for a long time. Finally, since their fellow-feelings were mutual, they gave him a woman of the tribe as a wife. He was asked whether he had any recollection of the route he and his people had taken to go into the interior. He answered that it was a long time ago that he had taken this route and that then the people of his tribe cleared a passage for themselves by cutting trees and cleaning out the underbrush with which this land was covered. He supposed that since that time brambles and weeds must have overrun the path. He had not gone there any more, nor had he been to see it again. Nevertheless, it seemed to him that if he began to follow it, he would be able to continue; and that this route began near a rounded mountain which could be seen from Puerto de los Reyes. He was questioned also on the number of days necessary to reach the first of these villages. He said that, according to his recollection, one could get there in five days and great provisions would be found there, for the Indians are excellent farmers.

/319 cont./

there, for the Indians are excellent farmers. In the course of the war with these populations the Indians of his tribe, he added, destroyed and depopulated numerous villages, but doubtless they had already rebuilt them. He was asked whether there were large rivers and springs along the way. He answered that he saw rivers, but that they did not have much water; however, there were other very deep ones, springs, lagoons, game, deer and tapirs, fruits and honey. He was asked whether at the time his people made war on these tribes he had seen any who had silver and gold. He said that in the villages they pillaged there were many silver and gold plaques, /320/ labrets, ear ornaments, bracelets, crowns, axes, small vessels; and that it was all taken away from them when they were put to rout. Those who escaped were able to take along some silver plaques, beads, labrets; but the Guaxarapo stole them when they tried to pass through their territory and killed them. Those who settled in the bush had a few, and he had heard it said that at the present time it was the Xaray who possessed this silver. He declared he had seen the Xaray, when they war upon the Indians, take out silver plaques which they had carried away and plundered in the interior lands."

Against this bundle of proofs attesting to the recent character of the Guarani migration, what is the value of Garcilaso de la Vega's vague affirmation (Vol. II, pp. 279-281) which some people want to oppose to it? According to this kind narrator, the Inca Yupanki would have undertaken the conquest of the Chiriguano country for the virtuous purpose of converting them to the good natural religion of the Peruvians. The Chiriguano would have been veritable monsters, feeding on human flesh, unit[illegible]y chance, living without fire or law, burying the bones of [illegible]eir dead in caves or in the hollows of trees. In a word, except for anthropophagy and the mention of the maloca (1), there is nothing in the picture of the

1. The description Garcilaso (Vol. II, p. 281) gives us of the large house of the Chiriguano is perfectly exact and very

/320 cont./

C 175 342

interesting: "they make a very big dormitory and, within it, as many small rooms as there are residents, and so small that they do not have room for more persons, and it is enough for them, because they do not have furniture, nor do they have wearing apparel and hence they go about naked." /Translated from the Spanish./ These facts agree on every point with those of the Relaciones geográficas, etc. (Vol. II, Plate CIV) and of Lizárraga (Vol. I, p. 259) on the same subject. The Guarani, just like the Tupinamba and other Tupi tribes, lived in maloca, gigantic halls capable of containing more than 150 persons and which often in themselves formed the village. The existence of this type of dwelling among the Chiriguano in the 16th and 17th centuries constitutes new proof for the recent character of their migration. In the 18th century we find them already in possession of the small rectangular house which they still have now and where one single family lives. (See Métraux, 2, p. 51.)

C [114] [113]

C [171]

C [174] [167]

C 114 127 175

novelist Garcilaso which might allow one to suppose that he really knew who the Chiriguano were. As for this conquest by the Inca, it would have been barely an attempt at conquest... Garcilaso confuses the Chiriguano with all the tribes of the eastern slopes of the Andes whom he had vaguely heard mentioned. Let us note that he is the only one to attribute this expedition to the Inca Yupanki, while the other chroniclers, better informed, are satisfied to say that the Inca Yupanki made an expedition against the Antis, probably around Cuzco. Unfortunately the vogue this pleasant writer enjoyed at a time when the history of America was still in limbo bluffs some modern critics into believing him, and they go so far as to prefer one of his unwarranted affirmations to the serious /321/ and precise evidence of chroniclers who get their information at first hand and from reliable sources.

C 114 127 175 648 [101]

/325 cont./

C Ce 175 648 [797]

of subjection which attached them to the Chiriguano: as a matter of fact, in the 18th century great social transformations took place and little by little they tried to free themselves from their servitude."

There is little to add to this account by Kersten (pp. 69-71), so clear and exact. However, I should like to complete it by quoting some texts of the 16th century which illuminate the drama of which the Chané had been the victims since the end of the 15th century.

C 175 72 167 Ce 175 648 C G [266] Ce [113]

The war of extermination made by the Guarani on the Chané dates from their first migrations to the country of metal. Thus it was that the Chané who, as we have seen, recounted to Irala the great exodus of the Guarani of Itatí before García's expedition, was taken along by the latter as a slave on the banks of the Paraguay. The Guarani, passing through his country at night, had attacked the homes of his people and taken women and children as captives. Later, this Chané was a member of García's expedition. Upon the death of the latter, the Guarani got ready to kill him to devour him as they had done with his companions and several women. He was able to escape and take refuge among the Guaxarapo (Relación de Domingo Martinez de Irala, pp. 347-348).

C G 175 72 567 Ce 175 648

In an account that a Guarani gave to the same Irala about the expedition in which he had taken part to go to the country of metal, he speaks of the /326/ Chané exactly as the Chiriguano will do a century later; "They fell," says he, "on the houses of slave and enemy Indians." This term "slaves" applied to the Chané characterizes well the relations the Chiriguano had with them until not long ago (Relación de Domingo Martinez de Irala, p. 330). In the middle of the interview a Chané challenged our Guarani to ask him whether he had been present when the people of Itatí destroyed his tribe. When the Guarani inquired who he was, he replied: "I am the chief of the slaves of whom you speak, and, taken prisoner at the time you say, I lived with these Guarani until the moment when I went away and came here. The land you speak of is mine. Why do you not tell the truth to the Christians who are asking for nothing else but the way to

Ce /331 cont./
178

323
[177]

The pernicious and corruptive influence of the white men, which makes so many ravages among the poor Chané, has at least spared their pottery industry. They still manufacture considerable quantities of vessels which they sell to the other Indians and to the whites. As clever business men they complied with the taste of their new clients, and the motifs with which they decorate the pieces they export are as hideous and gaudy as the ones which ornament half-breed or creole textile fabrics or baskets.

C
G
177
178
342
596

Moreover, we can understand historically certain phases of the transformation of the culture of the Guarani when they mixed with the Chané. The ancient Guarani used to live in the large house or maloca, that is, in gigantic huts sheltering several families. Having emigrated to the foot of the Andes, they kept until well into the 17th century a type of habitation which corresponded to a particular social organization (the large maternal and undivided family). In the 18th century we see them living in huts similar to the ones they still have today, intended to house only one family. In the same way one can witness the disappearance of cannibalism, which in the 18th century is no more than a memory among the Chiriguano. Certain traces of it have survived up to our day.

G
177
178
266

C
17

Thus these pages justify the assertions of the preface. With the Chiriguano we are dealing with a nation of recent formation whose civilization is a composite of Guarani, Arawak, and especially Andean elements. The geographic area inhabited by the Chiriguano can be divided into as many diverse zones of acculturation as America has. It has brought about, not the joining of three cultures, but their fusion.

Résumé

C
105
175

The Chiriguano belong to the Tupi-Guarani linguistic family.

C
[167]

They emigrated from Paraguay to the foot of the Andes in the last quarter of the 15th century and the first half of the 16th.

C /331 cont./
105
175
[167]
[173]

This migration had as its motive power the attraction which the metal riches of the Inca Empire exerted on the Guarani, and perhaps also certain mystical factors (the myth of the "Land without affliction").

/332/ The famous expedition of García is probably only an episode in this great migration.

ce
[197]
[199]

At the foot of the Andes the Guarani found a population of Arawak speech, the Chané, whose civilization had felt strongly the influence of the tribes of southern Bolivia subject to the Inca.

C
[648]
[563]
[619]

The Guarani exterminated part of the Chané, reduced the others to slavery, and took Chané women as wives.

The Chiriguano nation issued from this ethnic mixture.

C
[177]

From a cultural point of view, the Chané exerted a decisive influence on the Chiriguano; and it is through them that today certain aspects of the Inca civilization are continued by the Chiriguano.

ce
[199]
[197]
[198]

On their part the Chané adopted the language of their conquerors, keeping for a long time their Arawak speech as a secret language.

C
175
131

Situation of the Chiriguano in the 18th Century and Today

In the 18th century the territory of the Chiriguano can be defined as follows: "According to Jolis and Hervas, their domain extended from Tarija to the east a distance of 50 leagues (250 kilometers), and from north to south, 100 leagues (500 kilometers). Their frontiers were the following: In the north they reached 17° south latitude and advanced as far as the Jesuit missions of Chiquitos. In the south they reached 22° south latitude. In the region of Salinas, Itáu, and the upper Pilcomayo, they had as neighbors the Matako-Mataguayo and the Toba. Toward the west they had establishments as far as Chichas, Pilaya, Laguna, and Valle Grande. Permanent

C
[101]
C
[361]

177 /430 cont./ Let us not forget that
531 pyrography is a masculine activity and that men are more
[462] open than women to every innovation. Moreover, for the
[167] most part they have gone to Argentina, and from there, with
a new turn of mind, they brought back models and inspirations
foreign to their ancient tradition. This European influence
is patent in many cases; thus, the calabash of Plate LXVII. 3,
and the one of Plate LXIX. 1, are decorated with Arabic num-
bers. The calabashes of Plates LXIV. 1, LXV. 1 and 5, and
LXIX. 5, are decorated with stylized flowers or stars which are
not Indian at all. The influence of the white men and their bad
taste is evident in the motifs painted in roucou which decorate
the calabash of Plate LXV. 3.

531 Anthropomorphic or zoomorphic representations are
commoner on calabashes than on pottery. A rough draw-
ing of a man greatly schematized /431/ is represented on
the calabash of Plate LXIII. 1 a and b. On the calabash of
Plate LXIII. 2 a, dogs have been engraved and birds on
those of Plates LXIII. 1, LXVIII. 3 a and b, LXIX. 2, and
LXXI. 3. A llama was represented in very expressive
fashion on calabash No. 2 b on Plate LXIII; and on the
calabash of Fig. 85 a and b one recognizes a horse and
a feline animal, a puma or jaguar. Three fish and a bird
appear on the specimen of Plate LXVII. 2.

531 The Indians of the Ivu mission and the ones from
322 the Caipipendí valley paint their calabashes with roucou.
386 This color is very difficult to rub off and does not spread
beyond the periphery of the colored designs. /Fig. 86
appears here. To obtain this result, the Chiriguano begin

TRIBES OF THE EASTERN SLOPES OF THE BOLIVIAN ANDES

By Alfred Métraux

INTRODUCTION

Five tribes live along the slopes of the Bolivian Cordillera from the Argentine border to Perú: The *Chiriguano*, the *Yuracare*, the *Mosetene* and *Chimane*, the *Leco*, and the *Tacana*. The *Chiriguano* belong to the *Tupi-Guarani* group; the *Yuracare*, *Leco*, and *Tacana* represent still isolated linguistic families. The *Mosetene* and *Chimane* form a single linguistic group. 101

CHIRIGUANO AND CHANE

HISTORY

The *Chiriguano* (*Ava Chaiguanco*) (map 1, *No. 3;* map 2; map 8, *No. 5*) are the descendants of the *Guarani* who in historic times migrated from Paraguay and crossed the plains of the Chaco in successive waves to settle along the foothills of the Andes from the upper Pilcomayo River to the upper Río Grande (Guapay River). (Lat. 18°–23° S., long. 63°–64° W.) Seven migrations are alluded to in historical documents. 175 167 101

The first migration (1471 or 1476), reported by Garcilaso de la Vega, took place during the last year of the reign of Inca Yupanqui. Another, between 1513 and 1518, can be surmised from the testimony of a *Guarani* Indian who spoke to Alvar Núñez Cabeza de Vaca. A *Chané* Indian captured by the *Guarani* and brought to Itatí told Domingo de Irala in 1542 of a third migration, between 1519 and 1523, which probably came after the 1513-18 invasion and certainly before that in which Alejo García took part. The *Guarani* migration described by Diego Félipo de Alvaya, curate of Mataca, may perhaps be this third one, though many details are certainly fanciful. According to Gandía (1935 a, p. 26), this was the migratory shift which took the *Guarani* from the region of Itatí to the Province of Santa Cruz and which contributed to the formation of the *Guarayú-Pauserna* tribe.

The fourth *Guarani* invasion, about which we have the most complete information, occurred between 1521 and 1526. It is famous because a few White men, shipwrecked sailors of the Solís armada, accompanied the invading Indians. One of them, Alejo García, seems to have played a conspicuous part in this migration, although Díaz de Guzmán's (1914, 9:26–30) statement that García was the organizer of the raid may be doubted. With a strong force of *Guarani* he crossed the Chaco, probably at lat. 13° S., and invaded the borderlands of the *Inca* Empire. The raiders advanced as far as Presto to the northeast and Tarabuco to the southeast of Sucre. Fearing a victorious return of the *Charcas* (Chichas), the invaders retreated, carrying their booty. On reaching Paraguay, with *Chané* and *Tarapecosi* (*Chiquito*), Alejo

2 A [Maps 1, 2, 3 not processed for this file]

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10

175 169 Garcia was killed by the *Guaraní*. The historical character of Alejo García's expedition is amply proved by several passages in documents of the Conquest of Paraguay, mainly in the "Comentaries" of Alvar Nuñez Cabeza de Vaca (Hernández, Pedro, 1852, pp. 579–580). The success of this raid prompted many more *Guaraní* to migrate westward. Those from the Río Paraná followed the Pilcomayo River. Those from the region of Asunción entered the Chaco north of that city. The Indians of Jeruquisaba and Carayzapera, that is to say of the country of Itatí, entered the Chaco near San Fernando (lat. 20° S.). According to Díaz de Guzmán, these Indians were the ancestors of the *Guarayú* or *Itatinez*, who lived 90 miles (30 leagues) from Santa Cruz.

In a letter written by Martín González from Asunción in 1556, there is the following passage which confirms the continuous migration of the *Guaraní* toward the Andes: "These Indians [the *Guaraní*] go and come back from the lands of Perú. As they have no roads and avoid their enemies, they reconnoiter the land ahead of them, settle long enough to sow crops and harvest their food, and go on. So went those who for long had been settled in the Peruvian sierras and those who go today to meet the Christians.

"In Asunción are many Indians who with their wives and children have gone there two or three times from opposite that city, along a river [the Pilcomayo] that flows 2 leagues from here and comes from the city of La Plata. The Indians from Paraguay have settled by that river and along the Cordillera, over a space of 100 leagues. Some *Cario* [*Guaraní*] have gone to the mountains along another river, 42 leagues down the Paraguay River, which is called the Ypití [Bermejo River]. *Cario* are established in the mountains near the Ypití River, which also leads, according to what those who came from Perú say, to the city of La Plata." (Quoted by Gandía, 1935 a, p. 37.)

Several thousand *Guaraní*, serving as auxiliaries and porters, accompanied Domingo de Irala and Nuño de Chaves on their expeditions from Paraguay to the foothills of the Andes. It is historically attested that the 2,000 or 3,000 *Guaraní* of Itatí who followed Nuño de Chaves in 1564 were in part the ancestors of the modern *Guarayú-Pauserna*.

The *Guaraní* not only invaded and conquered the foothills of the Andes from the upper Bermejo River to Santa Cruz de la Sierra, but certain groups went even farther to the north and settled near the border of the *Mojo* and *Baurí* country. The *Pitaguari* (*Piritaguari*) were a *Guaraní* group established in the Sierras de Chiquitos, north of the first Santa Cruz. There were also *Chiriguano* around the town of San Francisco Alfaro in the Province of Chiquitos, near the Jesuit mission of San Xavier.

The *Guaraní* invasions, which started as plundering raids along the *Inca* frontier, were prompted by the desire to obtain gold and silver ornaments and copper tools from the *Caracara* (*Charcas, Chicha*) and from the *Chané* of the foothills, who were amply provided with these metals. Probably metal objects first reached the *Guaraní* of Paraguay through the *Chané*, whose villages were scattered across the Chaco from the Andes to the upper Paraguay River. Although the prospect of rich loot was certainly the predominant cause of their invasions, the old *Guaraní* dream of a land of immortality and abundance, the abode of the Great Ancestor, also may have played some part in determining their migrations.

175 648 The *Guaraní* finally became such a threat to the *Quechua* towns of the Province of Charcas that an *Inca* Emperor, probably Huayna Capac, built fortresses at Samaypata (Savaypata), Saigpuru, and Guanacopampa to halt their inroads. Sarmiento de Gamboa (1906, p. 105) speaks of Huayna Capac's wars against the *Chiriguano*, of the *Chiriguano's* capture of the fortress of Cuscotuyo (probably Incahuasi), and their defeat by Huayna Capac's general, Yasca. The ruins of these

2:Métraux E-5 (1929) 1948 SF10 Chiriguano SF10
Chane SF8

C 175 797 698 In 1732, the conversion of the *Chiriguano* was entrusted again to the Jesuits. Fathers Julian Lizardi, José Pons, and Ignacio Chomé entered the southern part of the *Chiriguano* territory and founded the missions of Concepción and Rosario in the valley of Salinas. About the same time, the Franciscans built a missionary center in Tarija and in 1757 they sent missionaries to the *Chiriguano*. In 1767, they reestablished the mission of the Purísima Concepción de Pilipili. After the expulsion of the Jesuits in 1767, the Franciscans continued their work with great success. Between that time and the end of the 18th century, the Franciscans founded many new missions north of the Guapay River (Río Grande): Abapo, Mazubi, Cabezas, Piray, Igmiri, Tacuri, Iti, Parapeti, Itau, Tapera, Iguirapucuti, Tacuarembuti, Piriti, and Obaig. Some of these were annihilated when the Indians rose in arms in 1796 and 1799. During the war of independence, the Franciscan missions were completely abandoned. In 1845, the Franciscans resumed the conversion of the *Chiriguano*, and built a series of new missions from Itau to the Parapeti River. The more important of these were San Francisco, Tarairi, Machareti, Santa Rosa, San Antonio de Huacaya, Ivu, and San Francisco del Parapeti. In 1896, a messiah called the *Chiriguano* to arms against the Bolivians by assuring the Indians that they had nothing to fear because their oppressors' guns would only "spit water." The messiah and his followers were defeated near Cuevo.

C 668 648 175

C 797 464 167 698 701 In 1929, the last missions were secularized, and the *Chiriguano* lost the protection of the Franciscans. Many of them migrated to the Argentine where they were employed as skilled workers in the sugar factories. The Chaco war spread havoc in the *Chiriguano* villages at the foot of the Andes. The *Chané* of the Parapeti River then put themselves under the protection of the Paraguayan army, and today they live around the fort of Toledo, intermarrying with Paraguayans, whom they consider to be their kinsmen, "because of the close relationship between both *Guarani* dialects." These *Chané* are sometimes erroneously designated as "*Guayaya*."

C 164 195 The 16th- and 17th-century chroniclers estimated the *Chiriguano* population at only a few thousand, exclusive of their *Chané* vassals. In 1810, there were 22,936 *Chiriguano* in the Franciscan missions. This figure includes only half the *Chiriguano* tribe, as the pagan members south of the Parapeti River were not reckoned. Cardús (1886, p. 242) gives the following estimate of the *Chiriguano* during the second half of the 19th century: In the province of Azero, 18,000; in the Cordillera and in the region of Izozo, 20,000; in the Chaco, from 5,000 to 6,000. Of these, only 8,000 were baptized and 3,187 lived under missionary care. In 1928, the total *Chiriguano* population was said to be 20,000. Today, after the Chaco war and constant migrations to the Argentine, their number must be greatly reduced.

C 161

ARCHEOLOGY

C 172 964 Few archeological finds were made in the region occupied by the *Chiriguano*. Nordenskiöld (1924 a, p. 40) mentions burial urns and ancient sites on the Parapeti River, and similar burials were discovered at Tarupayu. In some graves the dead were seated and were covered with several inverted bowls piled on one another. These bowls have hollow rims filled with pellets. Nordenskiöld refers also to direct burial in urns which show the characteristic corrugations of the *Chiriguano* and *Guarani* ware.

C 172 At Yumbia, in the Province of Tarija, at the borderline between *Chiriguano* and *Quechua* territory, the present author obtained fragments of jars with hollow rims, an anthropomorphic vessel with ring-shaped body covered with a red slip, and a specimen of beautiful stone panpipes with

/67 cont./

173 never name dead persons, with the result that the principal
[551] events are not known because the names of those great persons who took part in them are not known. The present ones know nothing about the many wars which were waged against the Quechua before the Conquest, after the enthronement of the Inca Yupanqui (1400), and /68/ against the Spaniards during the time of the colonization, the oldest people know little more, and we only know somewhat more through the Spanish historians and missionaries of the various religious orders of Paraguay and Bolivia.

173 Through their oral tradition they assert that their origin
• 167 was in Paraguay, that they multiplied there, and that when
648 the New World was discovered, because they had killed one of the Portuguese captains, they feared the revenge of his companions and fled en masse along the shores of the Pilcomayo River until they arrived in the region which they occupy today, displacing other natives who were in possession of these places (1).

1. This must refer to the flight of the 4,000 Carious who joined up with the Chiriguano here.

173 Nevertheless the oldest and most notable because of their
648 authority in this place give the impression that they originally came from Brazil. They say that in ancient times they had a formidable war with the whites who came from far-off lands: conquered by them because of the inequality in arms and their expertness in the art of war, they were pursued until they entered the plains of the Gran Chaco, which they crossed, coming into Paraguay. During the campaign they defended them-
726 selves and built fortifications at several points, of which I
712 know four: one is in Gutierrez, two in Cuevo Canon, and the fourth in Curuyuqui, which belongs to the San Buenaventura de Yvu Mision, where the uprising and defeat of the Chiriguano in the year 1892 took place (2).

2. I recently explored this last. It is one meter deep and one wide, and goes from the stream of Cuevo from northwest to northeast.

/70 con./

174 Consequently it was very natural that the race which
24 was emigrating from Paraguay should seek out for its needs
31 better lands which would permit it to make good use of its natural inclination to cultivate "Abati," maize, "Gilindaca," gourds, and "Cumanda," beans, because from the names that they give to all of these vegetables, it can be deduced that they did not get to know them after the discovery of America, but long before; and the same is true for the domestic animals. "Taimba," dog, "Uru," /71/ chicken, "Minta," cat. What is certain is that the Chiriguano race
174 has been distinguished and is distinguished from the others
25 which still remain in the savage state, and the Toba, as
563 well as the Mataco and the Choroti, regard the Chiriguano as nobles and masters, and they serve them in exchange for maize and other things, and there has never been a natural marriage involving a Chiriguano man or woman with the tribes named (1).

> 1. The Toba are more intelligent and more easily reduced than the Mataco; the latter were also exposed to the missionaries of San Antonio del Pilcomayo, located on its right bank.

The Toba have generally assisted their masters in wars and have lived for long periods among them, especially in the time of good and abundant crops. They did this before the missionaries opened Cuevo and Ivo to trade with the founding of the Santa Rosa and San Buenaventura missions, and they still do in the Franciscan missions of Macharetí, Tigüipa, and Tariari, because they are near these tribes.

174 The places that the Chiriguano selected for their resi-
169 dence after the migration were the mountainous one and the one visited by frequent rains, necessary so as not to lose the fruit of their labor, and in fact we do not see this race settled in places away from the mountain range, nor in impenetrable forest, good only for those tribes in a state of

/71 cont./

174 complete savagery (1).

169

1. Cayuguari, with some 30 Chiriguano, went to the desert to live among the savages to the east of Cavandaiti.

174 In addition to Chiriguano tradition and the fable of the
175 Aguaca-Tunpa, from which we understand that the race with
167 which I am dealing originated in Paraguay, there are ecclesiastical and secular authors who support my opinion. Among the first stand out the Franciscan missionaries Cardús and Martarelli, and the most eminent among them is the Most Reverend Father Corazón, who in his history of the school and missions of Tarija asserts that the most probable opinion is that the Chiriguano came from Paraguay, despite the fact that the Guaraní language is scattered through many parts of Brazil and some parts of the Argentine Republic; since, as we have just finished saying, language is a powerful argument in learning about the origin of a tribe, and it has already been said that Guaraní is generally spoken in Paraguay, so much so that it would not be an error to say /72/ that the Guaraní have gone to Brazil and to Argentina from the same Nation (1).

1. In the chapter "Religion and Beliefs" I shall discuss the fable of Aguaca Tunpa more fully.

175 Among the secular authors we have the famous d'Orbigny. According to him, before the discovery of America by the immortal Genoese, the Chiriguano occupied the last ramifications of the Bolivian Andes, lived completely naked, were
CSD cannibals, and were of Guaraní origin (1). The Inca Yupanqui

[569]
[266]

2. The Indians of Pacapiti told me that the Tapiti natives were their slaves, and that in the uprisings of the latter they ate their ringleaders and others.

175 648 /72 cont./ The Inca Yupanqui
promoted many wars against the Chiriguano with the intention
[125] of conquering them for the Inca civilization, but his efforts were in vain because his army was always conquered by the ferocity of the Chiriguano, who also had in his favor the fact that this was his own land and as a result he knew it well enough to be able to play tricks on the Inca militia with ease.

It seems that the Incas in their insistence on civilizing the Chiriguano brought their armies to the frontier of Cordillera Province. In fact there exists along the top of the range which divides this province from that of Acero and from Sapirangui Canton a fortress of great size, all of it made out of well-set stones, called "Incahuasi," "house of the Inca," and gives this name to the whole range, whose elevation to the south was set up by the law of interdepartmental demarcation as the boundary between Santa Cruz and Chuquisaca, when in the year 1898, the law of settlement was negotiated.

[192] Inca-huasi is a compound word of the Quichua /Quechua/ language; the Chiriguano language does not even have a word which resembles it; it is thus very probable that that fort was built by the Quechua and that, inasmuch as the forces were personally directed by the Inca, he should have ordered houses to be built along the whole top of the range, as can still be seen today (3).

3. The road from Caraparicito to Monteagudo through Incahuasi is not an old one. Don Octavio Padilla had it opened.

174 175 169 It is also a verified historical fact that after the discovery of Brazil and other regions of South America, 4,000 Indians fled from Paraguay, because in the many wars which they had waged against the Portuguese, they had killed the leader. Fearing general destruction, they came into Bolivia along the banks of the Pilcomayo River; in the Gran Chaco they found the region near the cordilleras occupied and inhabited by the ferocious Chiriguano, /illustration appears here/ /73/ but since they could easily make themselves

[Text continues on p. 105]

174 /73 cont./
175 understood, because they spoke the same language with slight
167 differences, they joined them, and from that moment the number of the Chiriguano was increased (1).

1. These 4,000 Indians were not of the Guaraní race; they had gone to settle in Paraguay and had learned that language imperfectly; they were called Carius and had killed Captain García.

The 4,000 Indians who fled from Paraguay because of the continual relations that they had had with the Portuguese had, at the time when they formed an alliance with the Chiriguano, a slight tincture of superficial civilization, just as in Mexico the Indians of Tlascala had learned it from Hernán Cortes and other Spaniards. As a result of this trace of civilization they had begun to use some clothing to cover, in principle, the most delicate part of the body; they had stopped eating the flesh of their enemies and prisoners and were more humanitarian in their dealings.

[266] Having established their abode and formed a single
[171] tribe with the Chiriguano, they introduced their kind and humanitarian customs among their ferocious friends, who softened slightly their haughtiness and pride, imitated their allies in the manner of dress, and began to abandon the barbarous custom of cannibalism, because of which they are distinguished today, and even for a long time before, from the Toba, Mataco, Tapiete, and Sirionó (2).

[197] 2. The Tapiete speak the Chiriguano language with a certain difference, and the Sirionó, it is believed, were ancient Chiriguano, because their language is somewhat similar.

175 The Chiriguano, thus united, continued to multiply
[161] much more and to extend their dominions into the different departments of the Audiencia, the possession of which they now had in lesser degree. Before a century had passed after the

/75 cont./

175 founded various missions, and today what is not in the hands
797 of the respective diocesan authority is all in the power of the latter group, who have irrigated this soil with the sweat of their labors for centuries (1).

1. The Jesuit Father Pons made efforts to found missions in the stretch between the Pilcomayo and Parapiti, with whose Indians he began to speak, but he was unable to do anything. This was done in the first half of the seventeenth century.

174 There is no doubt about the Paraguayan origin of the
167 Chiriguano native, as there is none about that of the Guarayo, whose language is the brother of the former's, despite the fact that they do not understand each other well, owing to the great variations which both have undergone. Paraguay is southeast of Bolivia and the region occupied by the Chiriguano tribe northwest of the former, with the Gran Chaco being the extensive region which separates the two republics of Paraguay and Bolivia. The domicile of the Chiriguano in the Gran Chaco is another circumstance which weighs heavily in indicating the Paraguayan origin of the tribe.

All that remains is to know the route which the Chiriguano followed in their migration to Bolivia; it might have been done in a straight line, crossing the Gran Chaco, which distance from the last cordillera west of Parapiti and Charagua to Paraguay is scarcely 100 leagues, but this route offers the insuperable obstacle of lacking the most important element for life, water. This has clearly been demonstrated by the calamities suffered by the various expeditions organized by the Bolivian government for the purpose of opening a straight road to Paraguay by setting out from Isoso (2).

2. The explorer Francés Thouar, after having gone over the route opened by the Arana, had to retreat because of lack of water and in a rash slip became lost and, with several others, nearly perished from hunger and thirst.

/75 cont./

174
169

They could have emigrated from their land of residence and followed the course of the Paraguay River on its right bank, arriving at Curumbá, and then across the salt flats of San José, coming to the places which they occupy today, but the stretch is longer, the water to be found is scarce, and over great stretches there is no trace of anything which /76/ might verify their emigration over this route, if indeed they would not have been attacked en route by the numerous nomads thereabouts.

[133]
[361]

It is necessary to conclude that they followed the banks of the Pilcomayo River; this rapid stream starts in the interior of the Bolivian Republic, crosses through the entire Chiriguano region, and empties into the Paraguay; its banks from near Azurduy up to Villa Montes is a straight line of more than 50 leagues, all populated by Indians who are clearly Chiriguano. From Villa Montes to Guachalla near the Esteros del Padre Patiño there are Choroti and Tapiete, who, with slight differences, speak the Chiriguano language; this stretch has plenty of water, fish, and fruit and is shorter than the above-mentioned one. Dr. Campos followed the banks of this river in order to arrive in Paraguay; Colonel Rivas, the Frenchman Crevaux, and the Spaniard Ibarreta followed the Pilcomayo River on their expeditions; they failed not through a lack of food or water, but some because they felt sure of the goodness of the Indians, and others because they had a very small force with them. All of these circumstances clearly show that the Chiriguano must have come into Bolivia along the banks of the Pilcomayo; the tribes along the way could not have offered them much difficulty, because their number was extraordinary; hardship on the travel rations was so insignificant that it allowed them to fight with vigor and bravery, and finally their attitude was peaceful (1).

1. Colonel Rivas and the Frenchman Crevaux were killed by the Toba, and Ibarreta by other Indians.

/76 cont./

174 167 When experience showed them that they could settle in the regions which they occupy today because the harvests were certain, they made their homes there and, when invaded, defended the territory at all costs, as has been seen. 241 433 [461] The region, as was seen in the first chapter, is certainly very fertile; when it is irrigated by rain, it produces every type of cereal; maize matures exuberantly, and the crops are splendid with little labor. If the fields are kept free of weeds with a couple of weeding hooks and there is no lack of rain, the Chiriguano can sing all year around the big chicha bowl in the company of his friends.

433 241 511 [131] But if rain is scarce, the crops are generally lost, and then the Chiriguano suffers, digs roots for his food, and sells everything he has, even his trousers and his wife's new tipoy, in order to support his poor family miserably. In times of scarcity the Indian plants with considerable hope a small patch where it is damp, such as around a lake or /77/ along some stream; plantings of this type are called socorro /succor/, and in fact they are, when roots can scarcely be found. Oh a few green gourd leaves at this time are like syrup in the Chiriguano's mouth! Poor Indian!

Language

192 [101] By what has already been related it can easily be understood that the Chiriguano are descendants of the Guaraní of Paraguay; thus the Chiriguano language is very analogous to Guaraní, as well as the Guarayo language, and it can be stated as a fact that both the Guarayo and the Chiriguano languages have the same relationship to Guaraní as that which exists among the Spanish, French, and Italian languages with respect to the Latin language, which is their mother (1).

[194] [171] 1. The Chiriguano language has very few accented words; in Guaraní they are abundant. For example, "abati," maize,

/78/

Statistics

161 The tribe is in complete decadence and in a few more
162 years will be entirely lost. At the beginning of the nine-
[181] teenth century, that is, before the war of South American Independence, in the Tarija missions alone there were more than 23,000 souls, and nevertheless that number did not include any of the numerous towns existing between the two large Parapiti and Pilcomayo rivers or the Indians of Caipipendi, Choreti, Pipi, and others located south of Lagunillas. At that time, I can state that the Chiriguano numbered more than 200,000, inasmuch as, according to the statistics of Father Lozano, the adult men fit for war, without counting women and children, numbered from 25,000 to 35,000.

• 167 Although Father Lozano was referring to the beginning of the eighteenth century, the difference must have been slight, because at the beginning of the nineteenth century there was not felt as there is today the emigration to the Argentine Republic, which began when the territory was opened to trade with the founding of towns of white Christians, which there are now in great number, up to the founding of large provinces with the names of Acero, Cordillera, and Gran Chaco, nor was there so much immorality as prevails today (1).

1. New laws have been made which make recruitment for Argentina impossible, and Dr. don Justo Padilla, the present national delegate from the Gran Chaco, at the present time does not allow the law to be merely written; he lets nobody through.

165 Epidemics, vagrancy, and emigration more than any-
161 thing, in addition to scarcity of provisions, are destroying this race, which is greatly needed and will be needed later for agriculture and cattle-raising in the provinces which have
000 been mentioned. Today there is already a need for farmers,

/79 cont./

178 464 [197] [162] Chaco and O'Connor Province, 5,000, in the Tarija missions there are 4,500, and in those of Potosí, 3,905, which makes a total of 26,405, including men and women, big and small, old and young. But of this number there are scarcely 8,000 day laborers, or strong men fit for any work, and what is the extent of land in Chiriguano hands through [131] [465] their own will or that of others? Some 140 leagues from north to south, more than 40 from east to west; if today the cultivation of these lands is difficult, tomorrow it will be impossible; if today it is hard to pay 40 centavos to the day laborer, tomorrow they will not be found for 80 centavos.

648 [167] There is a great struggle under way between the Chiriguano and the white; the latter struggles to increase his fortune and hacienda at any cost and tries to dominate and does dominate the Chiriguano, as one who is nobler and more powerful; the former struggles for his existence as long as he can, but, because he is weak and inferior, yields to the power of the white; when his spirit has been broken by the superior force which dominates him like a slave, he disappears and imperceptibly emigrates to a place where he is treated with more apparent humanity, though not certain and real, but which the Indian does not recognize (1).

[464]

1. According to references, the day laborer in Argentina earns 25 or 30 nacionales per month, without food, which in a foreign land is expensive for the Chiriguano; nevertheless, since the clothing and the animals which the company sells are not expensive, the day laborers who are economical and not given to drink come back well clothed, bringing a horse or an ass or clothing for his children and wife.

178 197 361 From this /80/ it follows that the large towns of former times and the very missions which antedate South American independence have in some cases disappeared entirely and others are on the point of disappearing.

/101 cont./

361 797 1. Machareti. -- Father Jerónimo de la Peña was the first to enter Machareti, but, before he could begin any work, death intervened, and only after a century, that is, in the year 1869, could the Cross of Redemption be raised, around which began to gather the settlers dispersed by the war and the death of Captain Taruncunti, not very friendly to the missionaries.

[162] Before the mission had been founded for ten years, it numbered more than 3,000 souls, but today it is much smaller, [167] its inhabitants reaching 1,500. Emigration to the Republic [464] of Argentina is a real plague for this area, because the principal recruiters of Indians for work outside of Bolivian territory are there, and it is useless to cite laws, because there are clever interpreters; meanwhile all wail for workers.

361 [133] Machareti has a delightful and picturesque panorama; to the north and to the east the human eye cannot take in the immensity of the plains or the exuberance of the woods and the variety and caprice of the hills. The town is located on a great plain, but is now quite reduced; its buildings, atop a high hill which dominates everything; it has a beautiful church with painting and /102/ gildings, a mission house of two stories, two great halls, with their respective patios, for instruction, and a third one for the music school, and also other buildings for shops (1).

361 797 131 1. When the Machareti mission was founded, it cut off the retreat of the bellicose Huacayeños, who were coming into the Gran Chaco by the Chorro road, some 15 leagues from Huacaya and some 12 from Ivu; its altitude above sea level is 771 meters and it is located at 20° 49' 58" south latitude and 63° 3' 44" longitude west of the meridian of Greenwich.

/106 cont./

Yacuiba

[131] [167] Because of an error in the demarcation of the boundaries with the Republic of Argentina, the town of Yacuiba is located to the south of the boundary stone, while it should be to the north, and the latter, the boundary stone, should be located precisely in Itiyuru, the limit of the Chiriguano race, which has occupied Bolivian territory since its immigration.

[103] Yacuiba, or Yacuigua, as the Chiriguano pronounce it, means: lake of the wild turkey. It is a rich region throughout; its territory is level, the streets which are being built are as straight as a line of this name, the land fertile. There are grown there the arveja or pea, the garbanzo, and other cereals, which plants are irrigated with water which is relatively abundant.

The town, which also fell in the earthquake of 1899, is being rebuilt according to modern methods, and its progress is rapid. It now has a first-class hotel, where the traveler and the countryman are served with all culture and exactness, department stores, where every article is found, and permanent buildings, houses of great size, and a customs building all of zinc from the walls to the roof.

The little city, in addition, is quite picturesque because of the many orange groves which continually embellish it with their green foliage and yellow fruit, /107/ which indicates the fertility of the territory and the abundance of water.

The little city is located in the territory of Tarija; consequently it was founded through Bolivian efforts. It is the seat of the subprefecture of the Gran Chaco, and today it is a cosmopolitan town, whether because of the many foreigners who have settled there or because of the many others who are continually passing through, not to mention the importance given it by the continual arrival of vehicles and that which it will receive from the proximity of the railway.

/120 cont./

578 Out of these general wars were derived other private ones, which civilized people called affairs of honor-dueling. This does not happen in private, as occurs among civilized people, who go off to a determined place with
578 their respective seconds. All is public, in the presence
541 of many people who come to drink. It is /121/ the caciques who incite their soldiers to match their strength and to avenge with crime an affront or an unfounded jealousy. When this happens, with or without a reason, the fighters place themselves in the midst of a whole crowd of spectators in the presence of the caciques, who urge them on with a word of command, while the poor angry men hit each other cruel blows.

578 Boxing is ancient, because formerly knives were not
[412] known and, if they had them, they only used them in
[178] their work in the fields. Now the picture has changed;
[167] the young are succeeding the old, and these young people
[464] continually go to work in the Argentine Republic. There they learn how to drink pure liquor, to handle the knife with which they are armed for their work, and to defend themselves. One small word is enough; it is enough if one says yainano, let us fight, the word of challenge, and knives are unsheathed, and then blood flows. Fortunately, they usually are content with inflicting wounds which rarely bring death because they do not deliver the blow with the point of the weapon but with the edge.

167 This mania for going off to the Argentine Republic has
464 them in continual movement, and, unfortunately, many of them remain for years, to return finally bringing almost nothing with them, and if one asks them, they answer very
167 rudely, "I drank it all." Last year's law has made recruit-
464 ment impossible. Several Indians went off, but they could
648 not get through Villa-Montes and returned (1).

1. If the authorities in Villa-Montes and Yacuiba continue to capture the Indians who are trying to escape, the law will not be in vain this time.

/121 cont./

Love for the Home

574 152 When someone has been away from his town for a long time and returns, he is received with much love. He enters his house without saying a word, and if he arrives at night, to the question of "Who is it?" he merely answers "Checo," it's me, and then those in the house begin to cry or give shrieks of joy which may last for five minutes, and soon they give him something to eat and the [114] questions and answers begin. I witnessed this without being seen one night in Parapiti at the San Antonio Mission.

152 591 ●167 186 It is not rare that once in a while a smaller or greater proportion of Indians temporarily leave their town, either because of scarcity or in order to avoid the anger or ill will of the cacique. They then go away with considerable unhappiness, and they go into exile like Hagar /122/ with her son Ishmael when they were ordered out by the patriarch Abraham. They cry as they leave, they cry along the way, they cry upon arriving in the land that receives them, where, in spite of the good reception which has been prepared for them by other people, they do not find peace, and they always sigh for their home.

When they decide that in their former dwelling place things may have changed, or that the cacique who is responsible for their misfortune and exile may have disappeared from among the living, they return (1). In Yvu, where

1. The Indian Cayuguari, because of a crime committed in Machareti, fled with a group of Indian friends and relatives, settled quite far away to the northeast of Carandaiti, and, as the cacique whom he offended is still alive and as furthermore Cayuguari began a life of cattle rustling, he never returned to his town.

the war of Curuyuqui (1892) occurred when the San Buenaventura Mission was founded, all those Indians who had taken part in the uprising were wandering about in

/122 cont./

152 other towns, and they returned almost en masse, and the first
571 thing they did when they once again trod the soil of their home-
167 land was to cry. I witnessed the arrival of a cacique with
186 his large family. Men and women came loaded with their household goods and children. They arrived in poor condition, covered with dust and sweat (it was at the end of December), tired and sad, and when they saw their fellow countrymen and relatives happy and content under the paternal rule of the Catholic missionary, they put their burdens down on the ground, in the houses of others, and then there broke out the tears and the wails, thus arousing the consternation of all the inhabitants and the missionary (2).

2. Father Corrado relates an analogous case in his Historia de las Misiones de Tarija.

Poor unfortunates! In spite of the vices which dominate their corrupt nature, there is something noble in the Chiriguano race. Their fondness for their native place, for their home, is great. They will make any sacrifice to return and prefer to die of hunger and thirst. They will never abandon their town and their home, unless constrained by necessity, fear, or persecution.

Along the road from Yvu to Parapiti there is a town called Itatiqui, where not even drinking water can be found in the vicinity. Want is eternal there; the crops are miserable there; and they either beg for water or steal it from the lakes which are more than five kilometers from the town. Some six years ago there were about 120 families there, persecuted by some whites to whom they did not wish to be subjected. I tried to take them away to form a part of San Antonio Mission, but it was impossible to move them from the place.

They prefer to suffer hunger, thirst, vexations, and persecu-
797 tions there, but they do not abandon the place. They would re-
829 main there very happily /123/ if a small mission were built for
177 them, as they desire, which is somewhat difficult, considering the special circumstances of the place, since the civil and

/204 cont./

643 Regional caciques are now very few, and they themselves
648 are submissive servants of the whites, who do not let them live
797 as they would like very much, but in matters referring to morality do let them live as they wish. Only the missionary makes them understand that such a life is contrary to divine law, but the Chiriguano refuses to understand this.

595 The important men assert that to possess many wives is
574 necessary for the preparation of chicha for offering hospitality
829 to guests and visitors. This excuse is not satisfactory, because
643 the cacique in the town where he resides is like an absolute king, and nothing is easier than to command his subordinates or relatives and always have his favorite drink; no matter how much of it he may want, he can always ask for more for himself or for his guests.

595 The subaltern caciques in general are bigamists, but they
622 do not become such in their youth, when they are like humming-
[582] birds, but at 40 or 50 years of age. This happens when the first wife is older than the husband, or his eye is caught by another younger woman whom he brings to his house as soon as he has her in peaceful possession. He at once orders the old woman to respect her. If she is quiet and consents, she continues working and serving her rival in the interest of food, but if she is not quiet, she receives a good dose of the stick, is thrown out of the house, and does not get back into it. But there are strong-minded women who do not allow the desecration of their home /illustration appears here/ /205/ where they have lived for years and have children of both sexes, who are then left behind because the man moves to the second wife's house (1).

[162]
[167]

1. Formerly, women were abundant because of wars. Today they are abundant because of the emigration of the Indian men to the Republic of Argentina.

[text continues on p. 279]

/237 cont./

648 It can be said with all certainty that the only laborer in
464 the four provinces of Azero, Cordillera, O'Connor, and Gran
466 Chaco is the Chiriguano, who is found even beyond Santa Cruz de la Sierra, where he also works, taken there by the authorities or by the owners of the lands, which they bought in ancient times for a trifle (1).

[425]

1. If one is to credit what the Indians say, in some places land was acquired by barefaced trickery /leva raida/ at the time of Ferdinand VII; in other places, for three or four arrobas of cheese, and in the last ones, for a cow, a poncho, a few varas of cloth, or a few bottles of liquor given to the cacique.

178 Today the Chiriguano, very abject, in many places suffers
[169] in resignation what, according to the story, he did not want yesterday; in other places he is migrating the better part of the time, that is to say, when his presence is necessary for the general planting, to which of necessity the old people must devote themselves if they want to live without dying of hunger and in order to be able to welcome the migrants when they return for a few days to show off their new clothing, their work from other regions, to sell it immediately for very little, to slaughter some cattle of their own or of their elders, and to go back at once without even saying good-by.

Property Rights

648 The object of the present chapter is to describe the
[241] method of cultivating the land when the Indians lived alone in the country, before the whites had moved in among them; now they scarcely give them /238/ room to do their planting
177 as best they can. Nonetheless, since they keep them con-
648 tinually occupied, food and clothing are never lacking to anybody in a Christian's house, where the Indian gets them

/304 cont./

797 and our Holy Mother Church (2).
871
177

2. The children know how to pray much better in the missions than in other centers, because in every mission there are two teaching establishments, one for boys and one for girls.

The youth grow up under the punctilious care of the missionary, who, by example and word, imbues their hearts with every goodness and love of holy and moral things, and moreover he makes them avoid, insofar as possible, all contact with the old people, managing it so that they see nothing, especially at night, not allowing them to sleep in their houses, except in case of illness and mourning, but it is not easy to avoid it altogether, because three times a day the children go down to the town to eat in their homes, and at fiesta time they are given a holiday, /305/ which they use in hunting birds or in bringing in firewood and foodstuffs (1).

1. The girls receive a more polished education under the uninterrupted vigilance and care of preceptoresses, who teach them, in addition to theoretical-practical religion, all the chores of their sex, from spinning to embroidery in silk and gold; the vestments and chasubles for use in the solemnities are the work of these girls.

797 What is most ruinous to young neophytes are certain whites
177 of the neighboring cantons, whose profession it is to sell liquor
273 and coca, which they secretly bring into the missions at times of celebration, during which even those of the race enter into the same trade, because they have seen that it is a very lucrative business.

●167 In addition many of them emigrate temporarily to the
593 establishments of the Argentine Republic, where, with the excuse
578 that they are going to earn a great deal with a little work, they lead too free a life, drink liquor like water, and become accustomed to drunkenness; then the first thing that they buy is an outsize

/305 cont./

knife; they learn to use it like the gauchos, get into fights, are injured, and even get killed, and, when they return to the mission, they only bring a little black clothing for themselves, a trifle or nothing for their wives, to whom they deliver a sovereign beating on the first chance they get, with reason or without, and then, at the first drinking bout they molest peaceful people, disturb public order, and always or nearly always it becomes necessary to bewail the spilling of blood. Let there be added to all of this the fact that the virus of irreligion is beginning to be inoculated hereabouts, and inasmuch as they are not well grounded in the dogmas of the Catholic faith, the result is that those who do not behave like infidels or indifferent persons are Protestants on the haciendas of the Argentine Republic and Catholics in the mission.

There is no doubt; moral, religious, and civil progress is the work of time; it is not the work of 40 or 50 years, as some believe. How long does it take to implant social reform among civilized people? How long did it take the Church to become established in the Roman Empire? Truth fought against error for more than 300 years; she was persecuted, shut up in the catacombs, and bathed in the blood of millions of martyrs of the Catholic faith, but in the end she triumphed and raised herself, radiant, above the ruins of error which had reigned for so many centuries.

No effort to implant social reform is made in the missions; what is being done is to build, to uproot the Indian from the jungle, to make him come out of barbarism, and to begin to teach him to be a man, to consider himself nobler than the brute; an effort is being made to remove from him the superstition /306/ in which he was born, so that he may believe in the maxims of the true faith. What sacrifice then must it not cost the missionary, who spends the best years, or even all the years, of his life in order to realize this grandiose project without earthly recompense, but rather with the marked scorn of those who should appreciate his highly civilized work (1).

1. The Father Prefect Friar Romualdo d'Ambrogi has been in the Potosí Missions since the year 1872; almost all the missions have been founded by him;

/306 cont./
797 continually shown (3).

3. A rest is almost imperative after a long stay in the missions, in order to refresh the spirit, because a bow which is always bent breaks, says the Evangelist St. John.

/307/ There is no traveler who does not marvel upon considering the progress of the missions, upon considering the beautiful works of the Indians, when they think that years ago there were impenetrable jungles and bare hills on the site now occupied by the grandiose temple and buildings. As was said by an enlightened Englishman, Protestant in religion, of course, the Catholic missions among the Chiriguano are like oases in the desert, and to see them at a distance stirs who knows what in the heart; even I do not know what I experience when on some journey I again approach and see them in the distance.

The Method

The method established since the beginning of the first founding of the missions cannot be improved upon, in that it looks toward moral and civil progress and has yielded practical results, especially in some missions where, despite the fact that they have been in existence only few years, almost all speak the national language moderately well. Is this not a near prodigy, achieved with a race whose language has no analogy with
000 civilized languages? /The remainder of p. 307 and the first paragraph on p. 308 are omitted. The remainder of p. 308 follows./

● 167 464 [797] Following the method which has been implanted, the missions progress and would progress further if the Chiriguano were not so changeable. Neither in their towns nor in the neighboring cantons is there any lack of work for them; but rather it is day laborers who are not to be found; they prefer to go far away where they may earn less than here, spending their small gains on things that are useless and harmful to them (1).

[511] 1. There are neophytes who stay on the haciendas

/308 cont./

167
464
511

of the Argentine Republic for eight or ten years: they drink it all up and when they want to come back they scarcely bring back more than a knife and a small black garment /ternito/, which costs little.

If one asks the reason for this procedure, so strange for them themselves, they answer that in their town they could never save up ten or 15 bolivianos, because they spend them immediately on trifles for themselves and their families, while in the Argentine Republic they keep their money in the master's house and, when they come back, buy clothing and even animals, tools, saddles, and other items. There is some truth in this, but just as it is not completely true that here their money does not last, neither is it completely true that they bring clothing and other things from Argentina. Those who are a little careful and who are not lazy dress very well here, while the vice-ridden in Argentina let themselves be overcome by laziness and return as naked as they were before; they arrive, spend or waste, if they have anything, and finally go off to live as they please (2).

101
167

2. The Chiriguano Indians call the gauchos, or natives of Argentina, criollos /Creoles/; they apply the same name to those of their own race who settle there for many years.

797
87
191
177

The method of instruction as it is applied yields prodigious results in the girls, who, in addition to learning their letters and worship, learn in the schools the tasks proper to their sex, from spinning to embroidery in silk and gold; certain mission schools for girls, for example, the one at San Antonio del Parapiti and the one at San José de Tigüipa arouse real admiration in visitors, both because of /illustration appears here/ /309/ the handiwork which is done in them and, in the former, because of the Spanish language, which from first to last they all speak with considerable perfection, since from the beginning the language of their parents has been absolutely prohibited for them in the school, even among themselves.

Indians in the years 1908, 1909 and 1913, and spent in all 4 to 5 months studying them. In my book «Indianlif» I gave a popular account of them as I got to know them during the Hermanzick expedition in 1908 and 1909. In my last book of travel «Forskningar och äventyr i Sydamerika» there is some information about the Chiriguano. I have brought home to Sweden from the Chiriguano and Chané about 1500 articles which are now in the Riksmuseum at Stockholm and in the Gothenburg Museum. In the Geographical Review I wrote a short article on the migrations of the Chiriguano Indians.

C
Ce
[126]

C
Ce
12
114

A close study of the Chiriguano and Chané civilisation by the ethno-geographical method affords points of especial interest, since their mode of life is rather well known and we are able to trace their history back to the beginning of the 16th century. I have also collected archaeological material from their region. At first I was minded to give an account of this, too, in the present work. I decided, however, that it would be better here only to mention individual finds by the way, and to leave the archaeological material for another publicktion in which I shall be able also to publish certain archaeological finds made in other parts of Bolivia. This for purely practical reasons.

C
Ce
121

I will here endeavour to make clear how the Guarani-speaking Chiriguano's and the Guaranized Chané' civilisation are compared, what culture-elements they have got from the Whites and from the Mountain civilisation in the west, what each brought to the common stock and what they possibly obtained from other quarters.

In this analysis of Chiriguano and Chané manners and customs, I do not intend properly to examine the question as to whence these Indians came to their present abodes. Broadly speaking we know that already. Respecting the Chiriguano migrations there are historical documents extant which evidently show that it was not until the beginning of the 16th century that these Indians conquered

C
175
448
●167

the tracts they now occupy.?) ¶ They drove out or subjugated the original population, which consisted chiefly of Chané Indians. They made slaves of a great number of them and ravished a great number of women.

The Chané are, as was mentioned, Arawaks and all indications point to their having come from the north or north-east, where they have large numbers of kinsfolk. It will be found that the present investigation confirms this. A matter of particular interest in this connection is to notice how two peoples belonging to the most important groups of tribes in all America made adaptations in their mode of life when they had emigrated to places with strange natural conditions. Again, it is worthy of note how their civilization was transformed and the influence of the Incaage civilization in the west and afterwards under the influence of the Whites. Further we shall see what they have, under their new conditions, been able to preserve of their original civilization. We shall gain insight into the way in which the civilization of two Indian tribes was transformed under the influence of other peoples and new natural conditions.

As in Part I, I deal chiefly with the material side of these Indians' life. Or rather, everything in their life which

?) [illegible] 119.

?) Steere, basing his opinion on Garcilasso and Montesinos, has assumed that the Chirigguano invaded the Inca Realm earlier than the beginning of the 16th century. But even if his assumption is correct, these inroads led to no desolification there. This is evident from the accounts of the invasion in the 16th century, when the Chirigguano supplanted, what was everywhere an original stock. Nor do we know whether by Chirigguano the Incas did not mean barbaric tribes of the Chaco in general, and not any particular tribe. In these parts Chirigguano probably corresponded to the signification that Cheneches had in the district of Cuzco, where it meant all sorts of barbaric Indian tribes east of the Andes. The Chirigguano that Garcilasso de la Vega and Montesinos speak of need by no means have been Guarani Indians. I have already pointed out (Documentary 19) that Garcilasso's description of the Chirigguano is absolutely irreconcilable.

Ea /298 cont./

177 797 The Indian, who loves an independent life, but is forced into the dance of civilization, does not want to become a mission child, but chooses this as the lesser evil. In the mission he is under guardians, but not under oppressors.

Ea 797 When my friend, the Chané Indian Batirayu, of whom I have spoken several times here, asked me whether it would not be best to ask the missionaries to come to the Chané on the Río Parapití, he thought of them as rescuers from the oppression of the white masters.

C 797 When I asked the Chiriguano chief Maringay whether he did not want missionaries to come to his village, the old man became quite indignant and said peevishly: "I have not done anything bad."

Ea 797 177 The greatest importance of the missionaries lies in the fact that they try to protect the Indians from the oppression and the vices of the whites. I have been pleased to see how the missionaries forbid liquor, the accursed liquor, in the mission stations.

Nevertheless, I do not believe in the future of the missions. It seems to me they are condemned to oblivion. To the extent that the Indians are given better treatment by the other whites and receive proper compensation for their work, they will leave the missions and forsake the guardianship of the Franciscan monks.

The missionaries, however, will always have the honor of having tried, at least to some extent, to protect the Indians from the other Christians. They have also earned honor for the studies they have made of the language, manners, and customs of the Indians.

Fear of the Rubber Regions

C 648 466 •167 In a previous chapter I spoke of the migration of the Indians to Argentina. In the /299/ northernmost territory of the Chiriguano Indians another emigration is taking place. It differs from the first, among other things, by the fact that it is not voluntary. It concerns the rubber regions in northeastern

c
648
466
[167]
[464]

/299 cont./

Bolivia. Every Indian who goes to the Argentine sugar factories knows that, if there is no disaster, he will return. No one holds him back by force. From the rubber regions, on the other hand, no one ever returns.

Is it true, they say, that there is a giant there who devours human beings? Is it true that people /300/ are ground

Ce
142

c
648
466

up into rubber? Is it true that the meat that comes in tin cans is from human beings? These are questions which the Indians asked me.

The Chiriguano Indians, especially from the Caipipendi valley, were lured in a shameless manner to the rubber regions in northern

Ee /301 cont./
648 Thus, the Chiriguano and Chané are on the direct road to
[466] being drawn into the anything but fortunate struggle between employer and employee.

The Bolivian government should see to it that the fields of the Indians are entered in the land register, so that whites cannot take possession of them. The government should also make it a condition that no Indian may sell his land. In this

C 415 531

Fig. 133. Clay vessel. - 1/9.
Chiriguano. Caipipendi.

Ee
648 way the government would guarantee the Indians the right of occupation of the land, but not the right of ownership.

Ee /302/ The uncertainty and the oppressive wage conditions
648 under which these Indians live naturally lead to emigration to
466 Argentina and, above all, to the circumstance that many
465 Indians abandon the land, not only as seasonal workers, but for-
167 ever.
425

Ee If the Bolivian government wishes to do something for the
648 Indians, it must first of all try to find a remedy for the worst
273 evil, namely, alcoholism. There is a tremendous difference
177 between drinking maize beer and liquor.

7:Rosen E-5 (1901-1902) 1924 SF10 Chiriguano SF10
Chané SF8

The Chiriguano inhabit the part of the Andean region, bordering on the Chaco, that roughly extends from the 18th to the 22nd degree of S. latitude. Within this region there is also found another tribe, viz., the Chané. These two tribes do not occupy each a territory of its own, but Chiriguano as well as Chané villages are found throughout the whole district thus jointly inhabited by them. No enmity exists nowadays between these culturally allied tribes. After the last great Indian rebellion against the whites (in 1890), a small portion of the Chiriguano tribe moved away into the interior of Gran Chaco, where it is believed that they are still remaining.

The western Chiriguano country, in which part the majority of the tribe is living, consists mainly of partly forest-clad mountain ranges, flanking wooded (fig. 187) or grass-grown valleys and small plains. It is a poorly watered country, but it mostly gives good crops, particularly gourd plants and maize. The climate is tropical, but in the higher parts the heat is not especially trying, except during the hottest season.

Although the Chiriguano and the Chané are on much the same level of material culture, they do not, however, belong to the same racial group, the Chiriguano being counted with the Guarani group, whilst the Chané are Arawak. The Chiriguano, according to Matienzo, took possession of their present country in the beginning of the 16th century, when a portion of the original inhabitants emigrated and settled in the Tarija valley.[1] Possibly the subjugated Indians belonged to the Chané tribe. In later times this tribe has adopted the language of the Chiriguano, which is Guarani. Whence the Chiriguano originally came is not known, but it may be taken as probable that, formerly, this tribe inhabited the lower reaches of Rio Parapiti.[2] The name of Chiriguano (quichua), which means »dirt people» was given them by the vainglorious Incas, who despised the Chiriguano people, affecting to look upon them as barbarians. The word »guano» is the name for the well-known bird manure-found on the coast of Peru and Chile. It seems however unfair indeed that the Chiriguano, who, in contradistinction to the Puna and Chaco Indians, are scrupulously cleanly, should suffer from such a misleading and discreditable tribal name.

167

The preceding historical sketch has shown that we can ascertain the history of the Chiriguano by means of numerous documents over a period of 400 years, up to that epoch so important for their future fate and culture, during which they emigrated from their native country and settled in a distant region. In this new country they found completely different conditions of life. All three factors by which all human life and all human culture are influenced and conditioned, nature, social state, and the spiritual culture of the ambient, were different in the new surroundings, and for that reason during the four centuries of their history they had to modify their primordial culture, which they had brought from their native country.

C
178
[126]

The products of their present-day culture, dealt with in this publication by means of the ethnographic collection that I brought from Machareti and Toledo, must be regarded as the result of numerous and different interacting factors. Some of the products of the old culture were kept in a fairly primordial form up to today; others were modified, either being perfected or in some cases degenerating. Many were completely lost because of the modified circumstances, and some were added as a result of the assimilation of outside cultures.

In addition to anthropological measurements made on four Chiriguano by Ten Kate (46), Robert Lehmann-Nitsche

46. Ten Kate. Herm.: "Matériaux pour servir à l'antropologie des indiens de la République Argentine /Materials for use for the anthropology of the Indians of the Argentine Republic/." Revista del Museo de la Plata. Vol. 12. La Plata. 1904.

in 1906 had the opportunity at the San Pedro de Jujui sugar mill to take the anthropological measurements of 40 Chiriguano men and ten women, who had come from Bolivia to work at that mill. Entitled "Estudios antropológicos sobre los Chiriguanos, /Pl. III-IV appear here/ [illegible]/ Chorotes, Matacos, y Tobas (Chaco Occidental)" (47), Lehmann-Nitsche has

C [113]

47. Anales del Museo de La Plata, Vol. I, No. 2, (Second Series). Buenos Aires, 1908.

published the results of these measurements, together with measurements of other Indians, and added to that publication in the first 12 plates Chiriguano types photographed by Carlos Bruch. In addition to the somatic measurements, determination of skin color, eye color, and hair color and form have been published by Lehmann-Nitsche. Thirty-six of the 40 Chiriguano men stated where they had lived, and from this we know that these people had come from various regions of Chiriguano territory to the San Pedro sugar mill. There were some who had come from the northern regions, and one had come from the city of Santa Cruz de la Sierra. Others had come from the south of Chiriguano territory, for example, from the town of Carapati, located considerably to the south of the Pilcomayo River. There are named 13 Chiriguano

C 166

C [167]

[Text continues on p. 30]

/14 cont./

Ce 131 still writes that the Chané were found scattered among the Chiriguano located among the last spurs of the Andes (53).

53. Moreno II, p. 254.

C 131 [114] Even after losing their independence, the Chiriguano inhabited more or less the same territory. Having known personally only Machareti out of the territory of the Chiriguano, I here refer to the data of Erland Nordenskiöld, who came to know them in the years 1908, 1909, and 1913 and personally traveled through most of this territory, spending up to four to five months altogether in the study of the Chiriguano and the Chané (54).

54. Nord. 2, p. XII.

According to Nordenskiöld (55), the territory of the

55. Nord. 2, pp. XIV and XV. Cf. Métraux I, pp. 332 and 333.

Chiriguano extends from the region near Santa Cruz de la Sierra in the north to near the Bermejo River in the south. Now the Rio Grande can almost be taken as the northern limit of C Ce 131 their territory. This is the land located between the boundary of the Andes and the great plain of the Chaco, in the valleys of which the Chiriguano, and in part the Chané live. It can be said that this territory is inhabited wherever there is the necessary water, although it may be no more than enough for and their domestic animals to drink. The Chiriguano inhabit that territory contiguously, while the Chané today live in territories separated from one another. Thus some of them are on the Itiyuro River in Argentina, some are in Caipipendi, some on the lower Parapití River, and others near Itaú, south C 131 of the Pilcomayo River. Outside of the territory of the Chiriguano which has thus been circumscribed, a few Chiriguano now live [167] in the Santa Rosa Valley north of Santa Cruz de la Sierra, and a few fled to the Chaco after the last broken revolt in 1890, without our having any information on their stopping place.

Acquisition of Raw Material of Inorganic Origin

Because it was the rich treasures of the Incas and of the bordering lands, especially their wealth in gold and silver, which stimulated the Chiriguano to immigrate into the regions bordering this empire, the question is posed as to whether the Chiriguano took part in the exploitation of the land for that purpose. We know of their battles with Guacane and his brother Condori because of the rich mines of Maypurún, and we know that the Chiriguano possessed these mines for some time and that on this occasion they took great quantities of gold and silver. But in those battles they captured Condori in person, and he was the owner of the mines, and they kept him no doubt to work the mines for them. Furthermore, their power over the region of the mines lasted a short time, because they were thrown back by the cacique Grigota /45/ as far as the eastern spurs of the Andes. We have no information that in their new land they had any opportunity to extract gold and silver from the earth, or that they themselves ever worked these metals in any major way. Today they have their silver ornaments made by the mestizos or the whites of their region, except for the single fact that the Chiriguano sometimes made their tembetás of tin.

301
177
439

316

Through the description of their tembetás and necklaces, we know that the Chiriguano have some semiprecious stones. As Nordenskiöld relates (213), they, according to their own

[177]

The pernicious and corruptive influence of the white men, which makes so many ravages among the poor Chané, has at least spared their pottery industry. They still manufacture considerable quantities of vessels which they sell to the other Indians and to the whites. As clever business men they complied with the taste of their new clients, and the motifs with which they decorate the pieces they export are as hideous and gaudy as the ones which ornament half-breed or creole textile fabrics or baskets.

Moreover, we can understand historically certain phases of the transformation of the culture of the Guarani when they mixed with the Chané. The ancient Guarani used to live in the large house or maloca, that is, in gigantic huts sheltering several families. Having emigrated to the foot of the Andes, they kept until well into the 17th century a type of habitation which corresponded to a particular social organization (the large maternal and undivided family). In the 18th century we see them living in huts similar to the ones they still have today, intended to house only one family. In the same way one can witness the disappearance of cannibalism, which in the 18th century is no more than a memory among the Chiriguano. Certain traces of it have survived up to our day.

Thus these pages justify the assertions of the preface. With the Chiriguano we are dealing with a nation of recent formation whose civilization is a composite of Guarani, Arawak, and especially Andean elements. The geographic area inhabited by the Chiriguano can be divided into as many diverse zones of acculturation as America has. It has brought about, not the joining of three cultures, but their fusion.

Résumé

C
105
175

The Chiriguano belong to the Tupi-Guarani linguistic family.

C
[167]

They emigrated from Paraguay to the foot of the Andes in the last quarter of the 15th century and the first half of the 16th.

In former times when artists were not lacking, the number of motifs used within each group must have been larger, and in this variety was doubtless found many an element which today seems to have disappeared, only to be met in another zone. It is probable that an ethnographer who might have made a collection among the Chiriguano a century ago would have established a classification other than the one I have tried to outline here.

Comparative Study of the Basic Elements of the Painted Pottery of the Chiriguano and Chané Indians

1. The Problem of the Chincha Atacama Civilization

The pottery of the Chiriguano and Chané Indians shows such strong affinities with that of the ancient Andean populations from the point of view of form as well as decoration that their relationship cannot be doubted.

These analogies are especially striking among certain pieces /397/ of pottery dug up in the Quebrada de Humahuaca and the ones still made by Chiriguano or Chané women. With an interval of four centuries the resemblance between the pottery of these two regions is still so pronounced that it had attracted the attention of Mr. Debenedetti (2, pp. 134, 149, note 1, and 156), even though he apparently had for his whole basis of comparison only a few rare pieces of very simple Chiriguano pottery collected in the Chaco and of such uncertain provenance that one of them was attributed to the Choroti. The latter in reality, have pottery of an entirely different type, although also influenced by the Andean civilization.

O
C
Ce
[648]
[439]

The affinities of Chiriguano pottery with certain pottery of the Quebrada de Humahuaca have been scientifically established by Nordenskiöld (10, p. 143). This scholar explains these surprising similarities very naturally by the influence the Indians of the Humahuaca region had on their immediate neighbors, the Chané or Chiriguano, and by the trade relations these peoples maintained.

C
Ce

these peoples maintained. These relations between Chiriguano and Humahuaca Indians are historically attested to. At the time of the uprisings which took place during the period of the Spanish conquest, Humahuaca and Chiriguano united to resist the common enemy (see Boman, 2, Vol. I, p. 77).

The yambuí and yapepo, of which I made a good collection in the upper Pilcomayo region, provide new evidence, even more conclusive, of this striking parallelism which appears between the pottery of the modern Chiriguano and the prehistoric populations of northern Argentina. To allow a direct influence of the Humahuaca Indians on the ancestors of the present-day Chiriguano living on the upper course of the Pilcomayo in the departments of Tarija and Chuquisaca would be a point of view difficult to defend. The radiance of the culture of the Quebrada de Humahuaca could have affected only the southern Chiriguano and the Chané of the Itiyuro. As for the hypothesis which would make of the Chiriguano the precursors of this culture, it is so absurd, so contrary to all good sense, that we cannot envisage it here. At the spot where the Pilcomayo gets ready to leave the valley that it digs across the Andean spurs to spread out in the Chaco plain, the Chiriguano had Chicha Indians as immediate neighbors whose territory extended to the north of the Quebrada de Humahuaca in the south of present-day Bolivia. It was they who transmitted the special forms of their pottery and its principal decorative elements to the Chané, who in turn left them to their successors and conquerors, the Chiriguano. Perhaps the Chané have not everywhere been the inevitable intermediaries between the two cultures; in many cases, Chicha groups must have communicated directly to the Guarani invaders the principal products of their industrial techniques and of their arts.

/398/ We know from 16th and 17th century documents that the Chiriguano constantly made forays into Chicha territory, that they raided their villages, made them pay tribute, and carried away groups of these Indians into slavery, as they did with the Chané. These direct contacts between the Chiriguano and their western neighbors must have contributed greatly to the spread of Andean civilization among them, and

/398 cont./

17 this explains why the Chiriguano culture of the upper Pilcomayo presents such close affinities with that of the Chicha, the Humahuaca, and the Atacama (1).

175
648
[101]
[177]

1. On the western borders of their territory the Chiriguano were in constant touch with the Chicha, whose territory they devastated and whom they obliged to pay tribute to them.

Lizárraga (Vol. I, p. 282): "the quality of the valley (of Tarija) being known, and the importance of its being populated, in order to check in that direction the Chiriguanas, who had done no little harm to the Chichas there, and they even paid them tribute, named as corregidor, etc...." /translated from the Spanish/.

Lizárraga (Vol. II, p. 117): "he went to Mosquera and returned, and with more than thirty natives, twenty of them Chiriguanas, and the rest indios Chaneses /Chane Indians/ in service, and among them two more illustrious Chiriguanas, one called Marucare and the other par excellence Inga Condorillo, and another Indian of Chicha nation, whom they confined with those Chiriguanas ..." /translated from the Spanish/.

Archivo de Indias (74-4-1, cited by Coni, p. 19): "and in about a month they reached another nation of indios called chiriguanaes, who thus neighbor this city a dozen leagues from potosí, and they carry off a pueblo of indios chichas who are called chupas." /translated from the Spanish/

Coni (p. 21): "In a letter from the licenciado Matienzo he tells us that the Chiriguanaes continued to raze the plains of Manso and, in addition, made frequent onslaughts on the Charcas, where they

C /400 cont./
A
17 It cannot be denied that there exist, between the civilization of Atacama and those of the provinces of north and northwest Argentina, of southern Bolivia, and of the coast of Chile, variants important enough to justify the subdivision of this culture zone into separate regions corresponding perhaps to the extent of tribes speaking different languages. But along with these local variations, how many similarities! How many analogies in technical materials and artistic forms! Farther on when I deal with fundamental elements of Chiriguano art from a comparative point of view, I shall have occasion to dwell on some of these resemblances and to give many an example.

The credit for bringing out the elements common to all these civilizations and seeking to explain them belongs to Uhle (1, 3, 4).

P.C
A
172 /401/ Already in 1913, on the subject of tablets from Chiuchiu, this scholar (Uhle, 1, p. 457) declared "that there had not been only one Atacama civilization, but several belonging to different periods." Several years later, after some systematic excavations he made in Pisagua, Arica, and Tacna, he tackled the "Atacameño" problem as a whole and proposed a plausible solution for it. Since knowledge of the results acquired by Uhle is important for understanding what follows, I believe it necessary to give as complete a résumé of them as possible.

Near Tacna, Uhle (4, p. 2) collected remains of several superimposed cultures, which he classifies in the following manner:

1. Period of primordial man (objects of paleolithic type);

2. Period of the Arica aborigines (first centuries of our era). The remains of this period belong to a very primitive population of fishermen;

3. Period contemporary with the Chavin ruins, which goes from about the year 400 to 600 A.D.;

4. Tiahuanaco period and continuation of the epigonal style, from about the year 600 to the year 900;

5. Period of the indigenous civilization of Atacama, from the year 900 to about 1100;

/441 cont./

194 177 286 482 [439] Everything thus leaves us to suppose that, in the early period of their settling on the western confines of the Bolivian Chaco, the Chiriguano procured by barter the carrying nets intended to replace the back baskets they had used until then. It was only later that they learned to make them themselves, adopting only the simplest and easiest of techniques besides. Thanks to this example we can catch alive the causes which have motivated the adoption of a new cultural element after the disappearance of another which rendered the same services. For that, two factors have come into play, the physical environment and the ethnic one. There was adaptation and borrowing at the same time. This fact also proves that a relatively civilized people never hesitates to appropriate the inventions of more barbaric tribes when they find some advantage in it.

285 • 17 The present poverty of the basketwork industry among the Chiriguano does not imply that it is insignificant and worthless. Perhaps before the decline of this nation it was more widely represented in each village. I was able to observe that the disappearance of basketwork /442/ went along with the influence of the white men. But, for the reasons I have given above, I do not believe that at any time there could have been found among the Chiriguano that abundance of objects made of basketwork which travelers noted among the Indians of Guiana or the Amazon basin. Formerly, when the ancestors of the Chiriguano were still living in Paraguay and Brazil, they possessed basketwork identical with that of the tribes inhabiting the regions I have alluded to. Proof of it is furnished by the survival among the modern Chiriguano of various types of baskets, fire fans, and sieves, of which we find /Fig. 101 appears here/ the exact equivalent only in Guiana and the Amazon basin. As we shall ascertain in the course of this study, the identity between these two ethnic areas is perfect from this point of view. The only difficulty is to know whether in this case it is a matter of the remains of an industry peculiar to the Chané Indians of Arawak origin, whose influence upon the Chiriguano was considerable, or whether this basketwork only continues that of the ancient Guarani emigrants. In my opinion the question does not need to be asked. The basketwork of the

/3 cont./

Ce 101 or Tapyi /Tapii/, it was not possible from what they said to ascertain with which of the tribes known to ethnology they can be identified. The Chiriguano call themselves "Mbya." [C 101] If the Izozó were a part of them, they would have called themselves by this name. Ce 101 17 No doubt they are Chané and that part of the latter which once had their homes in the Izozó River region, taking the name of this river for their own. Their culture, as demonstrated by the objects I collected among them, confirms this opinion. There are some differences between the objects collected among the Izozó and the Chiriguano in Machareti, either with regard to the decorations of the baked clay vessels or with regard to the making of the nets. But in principle it is not possible to decide whether these differences might not be only local differences. C 171 172 128 648 In general the culture of the Chiriguano was diffused in this way throughout the tribes successively subjugated by them, which is why it is proper to deal below with the aspects of the culture of the Chiriguano of Machareti together with that of the Izozó.

C Ce 101 17

Influences on the Culture of the Chiriguano and Izozó, Taken from Historical Data

C Ce [197] At the present time the Chiriguano and Chané form a cultural entity which can be designated as the culture of the Chiriguano, because the Guaraní language of the Chiriguano came to be the common language of the whole group. The Izozó also belong to this ethnic entity. Thus it is necessary to consider this entity /4/ as being formed of completely different tribes. It is also necessary to conceive of their culture as the product of the fusion of very heterogeneous cultural elements. Nordenskiöld deals with this question in one of his books (1)

C Ce [113]

1. Erland Nordenskiöld: The changes in the material culture of two Indian tribes under the influence of new surroundings. Comparative Ethnological Studies, 2. Göteborg, 1920. Cited in the following: Nord. 2.

different categories depending on whether they received them from the whites, from the culture of the ancient Peruvians, or from the Mataco, Toba, and other tribes of the Chaco, or have them in common with the tribes of the north and the east related to them, as well as those that they brought with them from their primordial homes between the Paraná River and the Paraguay River. In what follows we shall often run into this matter, and inasmuch as these cultural influences have taken place in historical times and we know the history of the Chiriguano through existing documents dating from the first days of the Spanish conquest, I would like to make a resumé of these historical data in what follows, insofar as they have influenced the cultural development of the Chiriguano and Chané.

In one of my previous publications which appeared in this journal, entitled "Los Guarayú," I ran into the point at issue, to wit: whether the first Guaraní immigration into the western regions of the Paraguayan Chaco took place before the expedition of the Portuguese Alejo García to Peru or whether it took place after that time. In that paper I then deduced that it can be supposed that before Alejo García's expedition there were no Guaraní in the western regions of the Paraguayan Chaco, because no author mentions that García, who was accompanied by many Guaraní, had met other Guaraní in those regions. With this opinion that the Guaraní immigration to the west occurred after García's expedition, which is based principally on indications by Guzmán, the opinions of Manuel Domínguez and Erland Nordenskiöld also agree. This question of the Guaraní invasion into the western part of the Paraguayan Chaco is also dealt with in detail by Fulgencio R. Moreno in his work Cuestión de límites con Bolivia (3). In that place (4) there

Although it may be that the shape of the wooden spoons of the Chiriguano and of the Chané may have been influenced in many cases by the shape of the metal spoons acquired from the whites, we must nonetheless regard it as a product of the indigenous culture of South America that in pre-Columbian times had been rather widespread generally among the Andean cultures. Its appearance is quite limited among the native tribes of South America, setting aside the cases where it has been imported by the whites. But it is quite common among the Indians of the regions near Chiriguano territory in particular, for example, among the Tapieté and many other Chaco tribes, such as the Toba, Matako, Churupí, and especially also among the Mojo and, farther to the east, among the Guató. It must be supposed that the Chiriguano received this cultural possession directly or indirectly from the culture of the Andean montaña.

Shells (Ínta) as Eating Utensils

Ce

Weavings Made on a Special Loom, from the Collection

I.A. 727. Bag (Izozó). Wool. Hgt. 21 cm. Width 22 cm. (Fig. 116.)
I.A. 728. Band " " Length 1.3 cm. " 3.7 cm. (Fig. 115.)

C Ce 286 19

Because of the contacts that the Chiriguano and the Chané had for a long time with the culture of the ancient Peruvians, it is surprising that the highly developed technique of the latter should not have had more influence on the weaving technique of these Indians. The fact is that the Chiriguano even today make most of their weavings with the typical loom of the Aruaco and with the warp in the form of a ring, which they doubtless received from the Chané. Besides these ordinary looms, the forms of looms that they received directly or indirectly from the technique of the ancient Peruvians are of little importance.

Ce 286 171

The two Izozó weavings mentioned above, and in particular bag I.A. 727, are weavings that are exactly like the weavings produced to this day by the Quichua /Quechua/ and also the typical weavings of the last period of the Inca Empire.

In order to explain the appearance of such weavings among the Chané of the Paraguí, we have an interesting observation by Nordenskiöld. The Indians told that author that they had learned that technique of weaving directly from a Quichua woman who had emigrated into their territory (274).

Ce [197]

274. Nord. 2, p. 178.

C 286 [199]

The Chiriguano loom for weaving bands and shown in a drawing by Nordenskiöld shows that the Chiriguano also learned to weave in the way of the ancient Peruvians (272) /fn. 272, which appears on p. 172,reads: Nord. 2, Fig. 55, N. 4./. In contrast to the manner of weaving described in the preceding, these weavings are made in such a way that the thread of the woof passes alternately through the threads of the front side of the warp and those of the back side. In addition to this, a double mechanism for the divisions of the warp threads makes possible many more variations in the ornamentation.

Ce 531

/81 cont./

clay vessels, in the form of incisings on the surface of *cuyas* and calabashes or flutes of wood or cane, in the form of pyrographic decorations on *cuyas*, and also, infrequently, in the form of tattooing on parts of the human body. The absolute difference between the drawings applied to the surfaces of baked clay vessels and those on *cuyas* and calabashes is surprising. This difference is explained by the fact that the decorations on the baked clay vessels are done exclusively by women and those on *cuyas* and calabashes by men.

Ce [542]

Ce 531 17

The basic elements of the painting done on the surface of the baked clay vessels of these Indians consist of geometric designs which are completely different from those of the ancient Peruvians and untouched by modern European influences. No doubt these are the products of an old and indigenous art. But we do not know up to what point this originated among the Chiriguano and to what point among the Chané. Neither do we know whether the differences between the nature of the paintings of the Chiriguano in Machareti and that of the paintings of the Izoseó of the Parapiti are only local differences or whether they are based on the difference between these two nations. But outside of that primordial decoration and mixed with it, there are foreign elements of decoration which we must reduce to ancient Peruvian models, and this is especially true of the drawings of plants on the surface of a Chiriguano vessel which Figures 64 and 165 show. One /82/ decoration, doubtless also phytomorphic, which appears repeatedly on the surface of the baked clay vessels, for example, on the vessels shown in Figures 67 and 71b, has a direct model in the form of a decoration that we know from the ancient Peruvian pottery of the last period of the Inca Empire (309). Zoomorphic and anthropomorphic repre-

Ce 531 532

309. See Max Schmidt: *Kunst und Kultur von Peru*, p. 349, Fig. 1.

sentations are found relatively infrequently among the decorations on the baked clay vessels. The quadruped shown on the surface

/320 cont./

C 175 342

interesting: "they make a very big dormitory and, within it, as many small rooms as there are residents, and so small that they do not have room for more persons, and it is enough for them, because they do not have furniture, nor do they have wearing apparel and hence they go about naked." /Translated from the Spanish./ These facts agree on every point with those of the Relaciones geográficas, etc. (Vol. II, Plate CIV) and of Lizárraga (Vol. I, p. 259) on the same subject. The Guarani, just like the Tupinamba and other Tupi tribes, lived in maloca, gigantic halls capable of containing more than 150 persons and which often in themselves formed the village. The existence of this type of dwelling among the Chiriguano in the 16th and 17th centuries constitutes new proof for the recent character of their migration. In the 18th century we find them already in possession of the small rectangular house which they still have now and where one single family lives. (See Métraux, 2, p. 51.)

C [114] [113]

C [171]

C [174] [167]

C 114 127 175

novelist Garcilaso which might allow one to suppose that he really knew who the Chiriguano were. As for this conquest by the Inca, it would have been barely an attempt at conquest... Garcilaso confuses the Chiriguano with all the tribes of the eastern slopes of the Andes whom he had vaguely heard mentioned. Let us note that he is the only one to attribute this expedition to the Inca Yupanki, while the other chroniclers, better informed, are satisfied to say that the Inca Yupanki made an expedition against the Antis, probably around Cuzco. Unfortunately the vogue this pleasant writer enjoyed at a time when the history of America was still in limbo bluffs some modern critics into believing him, and they go so far as to prefer one of his unwarranted affirmations to the serious /321/ and precise evidence of chroniclers who get their information at first hand and from reliable sources.

C 114 127 175 648 [101]

/329 cont./

Ce 172 167 [177] clearly Arawak by its technique and many a detail of its structure. It dates from an epoch when the Chané, newly come to the foot of the Andes, had not yet undergone the Andean influence of the populations of the Bolivian south (Chicha, Atacama, etc.).

C 181 171 When they arrived among the Chané, the Guarani had a civilization nearly identical with that of their racial brothers, the Tupinamba of the Brazilian coast, whose ethnography is so familiar to us, thanks to the old French and Portuguese chronicles. They differed little from their present-day cousins, the Kainguá /Caingua/ of Brazil and Paraguay, who are independent but impoverished Guarani.

C 177 181 Upon contact with the superior Chané civilization, the Guarani adopted it as it was, introducing, however, some cultural elements of Paraguayan origin. From this fusion of the two nations was /330/ formed a center of acculturation which we can designate as Chané-Chiriguano civilization.

C 177 It is through the medium of the Chané that so many aspects of Andean civilization still characterize Chiriguano culture. For how could we otherwise explain so strong an effect of Andean civilization on the Chiriguano at the time when that civilization was failing and disappearing, at least partially?

Ce 177 178 The Chané, on the other hand, established for centuries near the Chicha and other Indians of the south of mountainous Bolivia, have, thanks to their trade relations, submitted to the attractions of the Andean civilization which has infiltrated among them, as among the other tribes of the Chaco, in the form of toilet objects, jewels, artistic motifs, games, words, and vices. It is these multiple contributions which give the Chané culture this Andean appearance which strikes every ethnographer used to the peoples of Brazil. But, having come from the great forests of the Amazon basin, these "Quichuaized /Quechuaized/" Arawak have faithfully kept until today furniture and utensils which betray this origin and tie them directly to their faraway relatives of the Guianas. The Chané civilization was and still is a mixed civilization formed of elements from different sources and often of opposing nature.

/334 cont./

241 Before taking possession of a new plot of land the
423 Chiriguano is always careful to make sure that there is no trace
243 of previous cultivation. Otherwise the former owner or his
[685] descendants would have the right to lodge a complaint against him to the chief of the village.

[824] The Chiriguano makes known his new property right by planting any edible plant before the rainy season, for example, the large squash (gindako-wasu) which spreads everywhere and is not smothered by the underbrush. He can equally well insure possession of the chosen terrain by knocking down the underbrush all around and making big gashes in the trees (1).

[171] 1. Compare this manner of insuring property rights with the method observed by the Caxinawa /Cashinawa/ in the same circumstances: "I saw (an Indian is speaking) rising ground which is suitable for a planting. I am going to make a planting for this summer. I broke many branches on this hill to mark this excellent place. No one can make his clearing on this hill. This hill is excellent; do not go there to make your planting." (Abreu, p. 69.)

241 In the middle of the dry season, say, in August, the
243 Indian, with a long stick sharp on both sides, fells the underbrush which encumbers his future field and sets fire to it. This operation has the further advantage of fertilizing the soil, thanks to the bed of ashes, which is a rather good fertilizer.

The cultivated fields are usually cleaned up after the harvest.
[231] The domestic animals, who feed there with little expense, are first let out there, and then the fields are set afire.

[221] Sowing takes place in the month of November when the first rainstorms have softened the soil. This time is announced by
[821] the appearance of the Pleiades (itšu) above the horizon early in the morning.

/336 cont./

241 have described here. These finds were made in the ruins of
412 the Alfarcito and of the Pukará de Tilcara (Debenedetti, 4,
172 Fig. 17 and p. 32) and at the Huerta in the same Quebrada de
243 Humahuaca. Numerous wooden shovels have been dug up at La Paya (Ambrosetti, 6, Figs. 236-237, pp. 457-458), and Ambrosetti supposes with justification that they were hafted like those of the modern Chiriguano. Debenedetti (1, p. 35) obtained a specimen of this instrument at Kipón in Salta province.

[171] This type of shovel is particularly well represented in the archeological material of the Chilean coast. Numerous specimens have been found in Calama, Chiuchiu, and Pica in Tarapaca province (Boman, 2, Vol. II, pp. 731-732 and Plate LXVIII a; and Uhle, 3, pp. 15-16 and Plate I).

[171] The half-breeds and Indians of the Bolivian altiplano still work the earth today with a spade which in no way differs from that of their ancestors; moreover, it shows great similarity /337/ to the wooden shovel of the ancient Chiriguano (Chervin, p. 216, Fig. 120).

241 Nordenskiöld (9, pp. 30-32), studying the distribution
412 of this cultural element, established that it was peculiar to
171 the Andean zone and the adjoining regions. The Chiriguano
243 shovel nonetheless has a characteristic feature for which we should look in vain on all the specimens found inside the boundaries of the Inca Empire: this is the crescent-shaped handgrip. It corresponds quite precisely to the crutches terminating the oars in use among the tribes of Brazil, Paraguay, and the Guianas and on which the paddler puts his hand flat.

241 The Chiriguano formerly lived in a region rich in rivers and
412 streams, and they probably made use of paddles of this type to
174 go up or down them. Once settled at the foot of the Andes,
243 the resemblance between their former /Fig. 5 appears here/ oars and the shovels they saw in the hands of the Chané or the Chicha must have struck them; and they naturally sought to adapt to the new instruments this detail of structure whose convenience paddling had shown them. Such a hypothesis is not too adventuresome, for do we not have in the Chaco some shovels which have exactly the appearance of oars? (On this subject see the Ashluslay shovel published by Nordenskiöld, 9, p. 30, Fig. 1.)

/344 cont./

526 immediately, chased by his comrades who pulled his hair
178 energetically. The awkward player who threw the ball in such
243 a way that his partner could not catch it was in the same
789 category as the one who let it fall, on condition, however, that his opposite number had not made the gesture of catching it. Once the corn was ripe, they stopped playing mboto.

526
171

[179]

The game of mboto has a wide distribution in South America, but it is limited to the populations of the Amazonian basin and the Guianas. Doubtless the Chiriguano introduced it into the Chaco (Nordenskiöld, 9, p. 168).

526
789
243

This game without any doubt derives from a magical rite whose object was to promote the beneficial course of the sun and to oblige it to shine without interruption to make the corn ripen. The straw shuttlecock represents the sun. The period when this game is played and the meaning the Chiriguano attach to it make my hypothesis a very likely one. Preuss demonstrated that in all of Central America and even in North America the /345/ tennis game arose out of a magical operation intended to influence the sun.

Fig. 11. Straw shuttlecock (mboto), accessory for the game of the same name. Prov.: Carurutí. (1/3 nat. size.)

/353 cont./

372 [171] In former times the Chiriguano made fire exactly like all the Indians of South America, by rubbing two sticks one against /354/ each other. One of my friends from Carurutí reconstructed one of these devices for me in the hope of surprising me and getting a good price for it. He took two sticks of tata iwira, or fire wood (1), cut one of them lengthwise

[824] 1. According to Father D. Giannechini (Diccionario Chiriguano-Español, etc., p. 91), the Chiriguano might use, for obtaining fire by rotation, sticks made from the wood of a red liana whose

and provided one of its sides with two cups along which he contrived a perpendicular groove. These two little furrows were intended to conduct the glowing sawdust onto the tinder placed on the ground. /Fig. 25 appears here./ The other stick was slightly sharpened to allow it to go into the cups. Since this

262 /355 cont./ Women could eat, without
[562] harm, parrot, a heavy and stupid bird. In their misogyny the Chiriguano doubtless figured that that would not change their nature in any way. (Campana, p. 92.)

252 Cooking is not a secondary activity; it is an important form /Fig. 26 appears here/ of the material culture and an excellent index for judging the cultural level of a human group. The art of preparing dishes reveals as well as any tool the faculties of invention and taste. In South America one can very well classify the tribes according to the more or less great variety of their dishes and the care they take in preparing them. This hierarchy would certainly correspond to that of the cultural elements.

[171] In the Chaco, Chiriguano cooking stands in contrast by its variety, its /356/ taste, and its cleanness to that of the more primitive tribes like the Toba or the Matako.

Before passing on to the study of the utensils used by the Chiriguano housewives, it is fitting to describe their menus.

When the Chiriguano kill a cow, goat, or sheep, the meat is boiled in water, roasted on a spit, or dried in the sun (charqui). They are especially partial to the head of the animal they kill, and they eat it boiled after skinning it. The pieces of meat are cleaned carefully before being cooked; and the tripe, for example, which is a delicacy, is taken out beforehand.

Corn is prepared in various ways. If the ears are tender and green, they are boiled in water or grilled over the fire or under the ashes.

When the corn is still in this state, the women prepare simbikuai or humitas (in Spanish). They bite with an appetite into the still tender ears, chew the kernels for a long time, and spit them into a calabash. This white mash saturated with saliva is wrapped in corn leaves and put under the ashes.

[415] The Chiriguano give the name of atipíi to kernels of corn roasted in a special bowl called tapuipe (Plate XIII, 3) or in large potsherds, which tend more and more to replace the primitive utensil appropriate for this use. The atipíi requires

/356 cont./

252 no preparation other than constant stirring in order not to be burned. This food takes the place of bread for the Chiriguano, who like to munch these crunchy and appetizing kernels. They provide themselves with it when they go on a trip.

Atipíi pounded in a mortar and passed through a sieve gives atši, a brownish flour which has an excellent taste. Atši is also prepared differently: kernels of corn are reduced to a flour which is roasted in a terra-cotta roaster or in a wide potsherd. According to Nino (p. 246), the name atikúi would be given to the kernels of roasted corn made into flour after being put through a sieve and ground until pulverized. The same missionary reserves the term atši for roasted flour obtained from the residue left by kernels which have been treated in the following way: after letting them soak in water all night, they are poured into a sieve the next morning. When the water has drained off, they are pounded in a mortar. This flour is now sifted, then roasted; cooked in water, it is the dish the Chiriguano call muintí or huinti. Atši then would be made with the residue from the muinti flour, which is ground again, then roasted like it, but first mixed with salt or pimento. I [122] have often eaten roasted corn flour which the Indians told me was atši, but I could never tell that it was seasoned. The Chiriguano give the name abatikure to the corn bran.

This is how muintimimo is prepared: kernels of corn are /Plate XIII appears here/ /357/ put to soak all night. The next morning they are ground and sifted in an urumpé (sieve with very fine mesh). The flour is poured into a muitero [415] (Plate XIII, 1 and 2). This utensil is a terra-cotta basin whose bottom is pierced with holes like a skimmer (1). The flour is

[171] [114]

1. Linné (2, Map 1, p. 23) has given us the distribution of vessels with perforated bottoms throughout America. The enumeration he makes of them is very complete; yet it lacks mention of La Rioja in the Argentine Republic where Boman (5, p. 17) discovered fragments of vessels whose bases were entirely perforated like a sieve.

[Text continues on p. 104]

T /360 cont./
175 their four fingers from the earthen dish or other vessel in
264 which they keep it, even though they throw it from rather far away, nevertheless they put it so accurately into their mouths that they do not drop a single bit. So that some of us Frenchmen, wishing to imitate them, thought we would eat it in that fashion, and not being at all trained for that like them, instead of throwing it in our mouths, we discharged it on our cheeks and floured our whole face; /361/ consequently unless those principally who wore beards would have wanted to be accoutered as players of farces, we were constrained to take it with spoons" (Léry, Vol. I, pp. 143-144).

T This comparison permitted me to suppose that roasted
262 corn flour has simply replaced the "farinha" of the Brazilians.
252 As we know, the pulp of manioc tubers, after being carefully
264 squeezed in the tipiti, or trough, was roasted on a terra-cotta slab and changed into dry flour, with which the Tupinamba accompanied all their meals. The Chiriguano think the same
C 262 way about atši: they say that corn flour, in order to be eaten,
264 must have an accompaniment, an intina. To my way of think-
176 ing, atši and muínti are two substitutes for manioc flour that the Chiriguano invented or adapted after emigrating into a
C land where bitter manioc was unknown. Neither the other tribes
[171] of the Chaco nor the Quichua eat corn in this form, and, to my knowledge at least, there is no doubt that the Chiriguano introduced these two dishes into the country, without counting a goodly number of the ones which have been enumerated.

C The only fruits that the Chiriguano consume on a large
262 scale are the prickly pear or tuna (Opuntia), which are seen
C in all their villages. They also plant some fig and orange
[245] trees when they are under mission influence. They are also
[097] great lovers of melons, of sandias (watermelons), and when they have eaten one of these which has pleased them particularly, they keep the seed. They love sugar cane with a passion. Sorghum is especially meant for the children, for whom these graminaceae are a veritable sweetmeat. They suck the juice, which is as sweet as that of sugar cane.

/362 cont./

262 The Chiriguano call kumanara a leguminous plant, wild,
[252] which resembles the yuca and which can serve as food after being boiled. They resort to it only when pressed by hunger. The word designating this plant has a strange resemblance to
[192] the name of the batata in the Quichua dialects of Ecuador and northern Peru (Rivet, 3, pp. 583-590). It is perhaps a question of a Quichua word introduced into the Chiriguano language to designate a plant of which they did not have the equivalent in their original homeland. The case is nevertheless rare, and one can wonder if it is not a simple coincidence.

[222] Neither do the Chiriguano look down on honey, although they
[171] do not seek it with the passion of their cousins, the Kainguá. What I tasted among them was contained in thin honeycombs having the consistency of cardboard. It had a pleasant taste.

222 Any Indian who goes in search of honey (ei) must not make
784 his intention known to anyone and, if he is asked where he is going, he must answer: "To look for wood." If you do not take
[176] these precautions, the protecting spirit of the honey is warned of your plan and hides the honeycombs he guards (Diccionario Chiriguano-Español, etc., p. 86).

222 The missionary Corrado (p. 43) assures us that grass-
114 hoppers, cicadas, the larvae of bees are that many delicious
[252] dishes for the Chiriguano. He adds that these insects are roasted. Nino (p. 247) reproduces the statements of his predecessor and completes the list of strange foods by adding /363/ ants, lizards, leaves of the cucurbitaceae, melted tallow, etc. Personally I
[191] have never seen the Chiriguano touch these dishes strange to our palates, but I am all the more inclined to believe these two missionaries that the tastes they indicate are actually those of the Indians in other regions.

262 Already in the 16th century the Chiriguano passed as snake
252 lovers, even of poisonous species. They cut off the head and tail, skinned them, and roasted pieces of them on live coals. They used to eat them with pimento. No doubt the Spaniards con-
[178] fused snakes with iguanas, which even today the Chiriguano justly like (Lizárraga, Vol. I, p. 260).

C 273 /368 cont./

A certain variety of kãwi is prepared by boiling it again after passing it through the sieve and "bottling" it only after letting it cool a second time.

Kãwi is generally covered with a thick oily layer which the Indians are far from scorning. The mistress of the house takes the precaution of pouring a certain quantity of it into the vessels which do not have any.

In their descriptions of the preparation of kãwi, Giannecchini and Nordenskiöld say nothing about the temisu, the umopirai, and, in general, a good many of the stages the corn goes through before being converted into beer. This silence is probably due to the very complexity of this operation, more than one detail of which certainly escaped them. The preparation of kãwi is a tiring occupation which requires great effort. The Indians display a veritable science in its manufacture. It is easier to distill alcohol, and, in any case, this is a task demanding less physical activity. Perhaps centuries of groping were needed for arriving at determining the time of cooking, the proportions of roasted and chewed flour, the quality of the grain, etc. All that is the result of minute observations, many trials, and also much reflection. These considerations are intended to justify the remark made at the beginning of this chapter: a simple cooking recipe often tells as much about the civilization of a people as a perfected tool.

C 273 824 [171] ce [273] [824] [114]

/369/ The fruits of the mistol, chañar, or algarroba can give a chicha that the Chaco Indians like very much, but which the Chiriguano scorn. They have recourse to it only in case of scarcity. The Chané of the Izozoc, whom I could not visit, have the specialty of kãwi from batatas. The Chiriguano also know how to make use of this tuber to prepare a fermented drink, but they judge it to be of inferior quality and declare that one must be a poor devil to take any. (Nordenskiöld, 2, p. 236) (1).

1. Barco Centenera (p. 315) already mentions the different types of chicha prepared by the Chiriguano: "El vino de maiz y de algarroba,

/371 cont./

415 Certain vessels (Fig. 35) have the exterior surface entirely
531 covered with these depressions obtained by pressure of the thumbnail. The Indians call this decoration tatupire, that is "armadillo carapace," /Fig. 37 appears here/ a completely justifiable comparison.

One can consider as an evolution of the process of ornamentation by finger impressions the angles or chevrons which decorate the outside surface of the vessel of Figure 2, Plate XVI /see p. 125/, which have been incised in the soft clay with a pointed instrument. This type of ornamentation can be reduced to its simplest expression; thus on the neck of the vessel of Plate XVII, 2 /see p. 127/ it is limited to a row of little cavities made with a pointed stick. The small vessel of Figure 36 /see p. 128/ with a belly flattened from top to bottom belongs, from the decorative point of view, in the same category.

415 On another vessel (Plate XVI, 1) the small nipples which
531 project /372/ all around the belly constitute a summary
● 171 decoration which completes that of the neck formed by finger-nail impressions. Pots of this type are found among the Ashluslay (Nordenskiöld, 9, Fig. 65, p. 218).

This decoration is exceptional in South America. Jijon y Caamaño (p. 6) considers it characteristic of the northern part of Ecuador. He points out its distribution in Central America and in the Mound region in the United States.

[126] The îru of Plate XVIII, Fig. 2 /see p. 131 / has the exact shape of a calabash; this resemblance was intentional, for the Indian woman who sold it to me presented it at the same time as the calabash which /Fig. 38 appears here/ had doubtless served as a model. Vessels which are almost replicas of this specimen have been found at Jachal and Calingasta in San Juan province in Argentina (Ambrosetti, 1, Plate VII, and Debenedetti, 3, Fig. 41, p. 69).

415 The Chiriguano call the vessels in which the women
[462] draw the water they need for their households by the Quichua name îru. The îru are characterized not only by their more
415 or less globular shape and the narrowness of the neck on top,
323 but also by the quality of the paste from which they were

C
Ce
415
171
177

/373 cont./

Typologically, we must put the vessels of the primitive tribes of the Chaco in the category of the iru. Like the Chiriguano or their forerunners the Chané, the Matako, Toba, Choroti, and Ashluslay copied Andean models, which they adapted to their needs. It is appropriate to note that the seminomadic tribes of the Chaco must have fashioned their vessels in such a way as to be able to take them along with

T

177

them on their peregrinations, while the Chané and Chiriguano, sedentary nations, did not feel the need to modify the primitive form and kept the Andean prototype without bringing variations to it. For comparison I am reproducing here two vessels from the Chaco: one (Fig. 37) comes from the Toba section of Macharetí, and the other (Fig. 38) from an Ashluslay tribe traveling in northern Argentina.

/374 cont./

415 surmounted by two nipples, remains of stylized ears. These protuberances can be perforated and allow a suspension cord to pass through, which permits hooking the bowl to a beam of the hut (Fig. 41).

Spoons

412 Spoons are very common among the Chiriguano. Their
● 171 form connects them closely to those which have been made
172 known to us by the excavations carried out on the Bolivian altiplano and in northwestern Argentina. It is among the ancient populations of this region that we must seek the origin of this cultural element (on this subject see Nordenskiöld, 9, pp. 91-92), of which the Chiriguano have faithfully kept the primitive aspect and even certain peculiarities such as the indentations of the handle which /Plates XIX-XXI appear here/ /375/ are seen on one of our specimens and on one discovered in the Puna de Jujuy (Pucara de Rinconada) by Boman (2, Vol. II, Plate LIX, Fig. 142).

Beside these spoons, whose use spread under the influence
412 of the civilized peoples of the west, the Chiriguano kept the
237 most rudimentary forms of this utensil: the valves of a fresh-
824 water mollusk (anodonta) (in Chiriguano: inta) are often used by them to eat liquid dishes; the shell of the fruit of a bignoniacea (?) opened lengthwise also appears in the north of the Chiriguano territory as the survival of a time when spoons were still unknown to them (Fig. 44).

412 Some small calabashes, ovoid or round, with a jutting peduncle, can, after being cut through the middle, replace
[171] wooden spoons to advantage (Fig. 45). It was in this natural form that the spoon spread in tropical America where Andean influence did not make itself felt. The Chiriguano do not disdain using these half-calabashes to dip into the bean pot or the meat broth. Calabashes like the one of Figure 46 /see p. 139/ take the place of ladles.

/375 cont./

Calabashes

415 In each Chiriguano village calabashes are as abundant as pottery (see Fig. 47 /see p. 139 /). The huts are full of them. They are of every shape and size, from the spoons we spoke of to the big basins in which the kāwi is distributed on feast days.

[286] The calabashes which are ovoid or gourd-shaped are generally enveloped in a kind of rudimentary net of vegetable fibers or leather thongs, which allows them to be carried in the hand or hung (1). In them is put either water, or grain

415
286
● 171

1. Nordenskiöld (10, p. 97) has given the list of the South American tribes who put their calabashes inside a net to carry or hang them. This contrivance is widespread on the continent and its distribution is certainly greater than that indicated by Nordenskiöld, but travelers generally take only slight interest in such details, which are nevertheless important. The Kaingúa of Paraguay encompass their calabashes with wembé bark just like the Chiriguano (see Ambrosetti, 2, p. 716).

415 and seed, or roasted flour, or finally roucou or kalasapa powder saved for feast days (Plate XX, 1 and 2; Plate XXI, 3 and 4).

[322] Some calabashes are provided with a lid which the Indians make by cutting a calotte with star-shaped edges in the still green fruit, and this then forms a hermetic closing. The lid is fastened on by means of a small cord which, when pulled, suffices to close the calabash /376/ (Plate XX, 4 and Plate XXI, 2). Gourds whose opening is small in diameter receive a fragment of a shelled ear of corn as a stopper. /Figs. 42-47 appear here./

[121] Painted, pyrographed, or incised calabashes will be the object of a special study.

/377/

Wooden Bowls and Basins

C 415 171 439

The Chiriguano also use wooden bowls (Fig. 49). I do not know whether they make them themselves or receive them from the half-breeds of the /Fig. 48 appears here/ San Luis region. In this latter case the Chiriguano of the San Luis (Entre-Rios) region would be the only ones to make them. In Tarija /Figs. 49-50 appear here / where these bowls are much sought after by the half-breeds, they were indicated to me as coming from that zone. The rare wooden bowls which /378/ I saw at Caipipendí had been bought by the Chiriguano in the course of their trips. The same origin must be attributed to the wooden troughs found among the Chiriguano who live near the Quichua half-breeds of Tarija department. These basins are used for washing food and also as bathtubs. The Choroti have wooden dishes (Nordenskiöld, 9, Fig. 20, p. 88) which have a shape very similar to that of the trough reproduced here (Fig. 50) and which doubtless were introduced among them either by the ancient Quichua or by the half-breeds. Among the Araucan of Argentina wooden basins are found, which are similar in every detail to those of the Indians and half-breeds of Bolivia and the specimen pictured here.

Chapter V

Tools of the Chiriguano

C 412 178 [179]

The work tools the Chiriguano use nowadays are almost all of European manufacture. Here and there the ancient forms were kept when stone or bone were replaced by iron. Witness the adze of Plate XXII /see p.143 / which constitutes a curious survival of the eared or T-shaped ax certainly adopted by the Chiriguano after their migration and their establishment at the foot of the Andes. This type of ax is unknown to me from any other Tupi-Guarani tribe and is rare in the area occupied by the different nations belonging to this linguistic family (see Rivet, 1, pp. 149-155).

/378 cont./

412 114 171 178 The specimen I am publishing here was still giving good service to its owner, who gave it to me with regret and only for a large sum of money. The presence of the eared ax among the modern Chiriguano invalidates the allegation of Nordenskiöld (14, p. 120), who places it among the cultural elements which have completely disappeared in South America. It survived [181] thanks to the prodigious conservatism of the Indians. I am convinced that several of the objects whose disappearance is attested to by Nordenskiöld will perhaps be found in some tribe now living, when we have more abundant ethnographic material from South America than we now have at our disposal.

412 171 Another very interesting peculiarity of this ax is the bent shape of the handle, to which the blade is securely fastened with leather thongs. The distribution of the bent-handled ax has been traced by Linné (2, p. 202). Few tribes of South America have continued to use it up to our day. They are: the Colorado of Ecuador, the Tukano /Tucano/, Tariané, and other tribes of the /Plates XXII and XXIII are here/ /378/ Caiary-Uaupés, the Tehueiche, and the modern Quichua /Quechua/. Among the Indians of the Caiary-Uaupés the tool lost all practical value and finally became a simple dance accessory (Koch-Grünberg, 2, Vol. I, Fig. 225, p. 350). /Fig. 51 appears here./

The bent ax has been found archeologically in Peru (Chuquitanta: Marquez Valley near Lima) and in Casabindo in La Puna de Jujuy (Argentine Republic). The specimens from Peru are designated as being hoes, which is possible. However, I shall call attention to the fact that the Chiriguano specimen from Caipipendí is exclusively a carpenter's instrument, which the Indians use for cutting the pieces of wood from which they make their furniture or weapons. /Fig. 52 appears here./

Figure 51 shows how modern axes of the simple neolithic ax type can be hafted exactly like their stone prototypes. The similarity of this ax to the stone ones used up to today by the Guayaki extends to the somewhat arched shape of the handle and to its slightly swollen upper end (La Hitte, Plate IV, 9).

...iron blade has the form of the T-shaped axes of ancient Peru. Prov.: ...(1/2 nat. size.)

Mold for Tembetas

The tembeta, or labrets, of the Chiriguano are of tin. They make them themselves with the aid of the mold pictured here (Fig. 53). It is a calabash into which the fins of the labret have been hollowed out, while the thicker central part of the ornament corresponds to the end of a stick going through the calabash. The cavity produced in the central part of the labret is then filled with wax into which glass or turquoise beads are incrusted. These come from ancient burial-places and are sold to the Chiriguano by the half-breeds of Tarija.

Balances

276
177
171

The Chiriguano of the upper Pilcomayo and the Igüembé valley prize coca quite as much as the Quichua of the altiplano. Besides, it is from them that they got this vice. The fact is known and does not need to be demonstrated. This custom

/380 cont./

276 177 171 spread among the Chiriguano recently for it has not yet spread throughout the territory they inhabit. The Chiriguano who live far removed from the half-breed or Indian populations of the Cordillera are not "coqueros," and only rarely does one meet among them some old man who accepts a quid of coca.

276 171 302 114 Ivu is the last point toward the east and north where I could distribute my supply of coca to advantage. Nordenskiöld (10, pp. 85-91) sought to demonstrate that the custom of blackening the teeth went along cheek by jowl with that of chewing coca and derived from it. As a matter of fact, this habit has a very marked western distribution and follows the zone of coca cultivation.

276 [824] The Chiriguano mix each quid of coca with the ashes reaped from a tree (ulala) whose scientific name I do not know. These ashes (tanimbo), which corresponds to the llicta of the Quichua, are contained in a small leather bag.

276 439 804 Coca is a luxury commodity which the Quichua Indians or half-breeds come to sell to the Chiriguano. To avoid all argument and all fraud on the part of unscrupulous sellers, the Chiriguano have recourse to balances of their own making. They fabricate them with /381/ two calabashes cut in half to serve as scales (Figs. 54 and 55). The balance with scales was in [177] use in pre-Hispanic times /Fig. 54 appears here/ in the ancient Inca Empire (see Nordenskiöld, 16) and so I believed at first that among the Chiriguano it represented a survival of /Fig. 55 appears here/ the Andean influence, whose importance we shall see further on. Among the Chiriguano, however, this object is designated by the Spanish name /382/ mbalanza, which seems to indicate that they borrowed it from the half-breeds. The latter and the Quichua use them in their commercial transactions, but especially for weighing the precious coca. Perhaps it was the same in prehistoric times. There is nothing to prove that only metals were weighed, as has been supposed with respect to these ancient scales.

804 177 For weights the Chiriguano use old Bolivian silver coins and express measures according to the old Spanish system. By a tacit convention a coin worth two modern sous is the equivalent of one ounce.

171
This makes me think that glazing implies a technical process analogous to the one in use on the upper Pilcomayo.

Ce
C.I
323
The Chaco Indians draw crude decorations on their vessels with palo santo resin, which they apply after firing. According to Nordenskiöld (id. supra), the Chané of the Itiyuro probably use the same method to decorate some of their vessels with black designs.

C
323
After being painted, the vessel is put in the shade to dry for several days. It is only when the sides have acquired a certain hardness that the firing process is begun. The vessels are then taken to a spot where there is plenty of dead wood. A large quantity is collected, with which the vessels are covered from bottom to top. Generally, long pieces of bark are selected, which burn brightly.

They set fire to this pyramid of wood and, with a long pole, the /388/ potter watches to see that no brand burns directly against the walls, which would bring on a "shot of fire." When she ascertains that a vessel gives a metallic sound on being touched, she scatters the firebrands with her pole and, by rolling it, makes it go out of the fire.

It may happen that in the course of the firing a vessel may suffer some cracking. This is remedied by taking a little moist earth mixed with dung and applying it on the split while the vase is still hot. The fissure closes, but remains noticeable.

Classification of Chiriguano Pottery

C
415
The figures which illustrate this text, the plates published by Nordenskiöld (10, pp. 155-162), and the diagram of Outes (3) give a better idea of the more common forms of this pottery than any description. However, a few remarks are called for.

C
[184]
Vessels with a subglobular belly surmounted by a low, wide neck flaring at the top constitute, without doubt, the most widespread type. (Plates XXXV-LVII.)

O 172 171 415 /399 cont./ It is already evident that the pottery of the Humahuaca region shows identical characteristics from the north of Jujuy to the vicinity of La Quiaca. To me the local variations seem absolutely negligible. Boman (2, Vol. I, p. 77) was already expressing himself in the following manner on the relations between these two regions: "If one wishes to compare the objects dug up in the Humahuaca region with the pre-Hispanic remains of other regions, they would be most like those of the Chichas." At

Fig. 67. Panpipe made of olive-hued stone, found on the upper Pilcomayo near the Chiriguano village of Ibopeytí at the same time as the vessel on Plate XXV. (1/2 nat. size.)

C 172 171 415 AT Tolomosa in Bolivia, in the department of Tarija, the von Rosen mission (2, Fig. 175, p. 112) found an ornithomorphic dish, an exact replica of the famous puco of this type discovered at La Paya in the Calchaqui Valley.

A O 172 171 18 The Humahuaca-Chicha culture does not form an isolated bloc. It is more or less closely related to those whose remains have been studied in the northwest of Argentina in Diaguite territory, on the Puna de Atacama and de Jujuy, in the Atacama Desert, in the north of Chile and the extreme south of Peru. In the geographic area thus defined, it surely seems as though there was formerly a center of acculturation whose existence was pointed out only a few years ago.

/404 cont./

concerning the importance and the extent he gives it. To the Chincha-Atacama sphere of influence belongs, precisely, the culture of the Andean Chincha and Humahuaca peoples whom the Chiriguano and their Arawak predecessors had as neighbors for centuries.

2. Analysis of the Influences Exerted on the Fancy Pottery of the Chané and the Chiriguano

The criterion of form. -- The influences which have made themselves felt on Chané and Chiriguano pottery are manifested in both form and decoration. In the pages to follow I propose to note the most striking affinities between Chiriguano and Chané vessels and those of the neighboring regions, and also to determine the importance of Guarani or other survivals which we meet here and there.

1. Vessels with a subglobular belly, short neck, flared lips, flattened base, constitute the most common type of fancy pottery (Plates XXXV-XL, XLVII-LIII, etc.). Pottery of this category lacks well-characterized counterparts in the Andean zone. On the contrary, they resemble the jars for kaśiri still used by the Indians of Guiana and the Amazon (Koch-Grünberg, 2, Vol. II, Fig. 151, p. 227).

One of the yambuí (Plate XLVIII, 3)[1] of this type has as handles on each side of the neck two little miniature vessels of the same form as itself. In what is perhaps only the fancy of a native artist appears nevertheless a concept peculiar to the Andean peoples and one in harmony with their style.

2. The yapepo (Plate XLV, 1 and 2; LIX and LX)[2] are subglobular vessels with a low neck, provided with a handle which extends from the rim to the belly; they can be considered as yambuí in miniature. This category of vessels has its equivalent in several points of the adjoining Andean zone. Thus in Calama (Atacama Desert) and in Cagua (Yura canton, Porco province) pots have been found which seem to be, from the point of view of form, replicas of Chiriguano yapepo. (Créqui de Montfort, Plate VII, Fig. 8, and Plate VIII, Fig. 11.)

a b

Fig. 70. The iru (a), drawn from Debenedetti, was found on the Isla de Tilcara. Vessel b is modern. It comes from the Chiriguano village of Yumbía. It attests to the fidelity with which the Chiriguano have kept to our day the ancient types of Andean pottery. (1/6 nat. size.)

C 415 171

3. The large yambuí of Plate LV, 3,[1] is not a common type in South America. Jijon y Caamaño (p. 24, Fig. 15) cites only one specimen, coming from Imbabura in Ecuador, which was known to him outside of Chiriguano country.

4. The two yambuí of Plates XLI, 1,[2] and LV, 1[3] both come from the Ivu mission. Their form is unusual in Chiriguano country, but very interesting by reason of the analogy it offers with that of vessels dug up in Catamarca province in Caspinchango (Debenedetti, 5, Figs. 9 and 10, pp. 23-24) and that of funerary urns from La Rioja discovered and published by Boman (5, Fig. 4b, p. 24).

[415]
[172]

5. The iru of Fig. 70 b goes back into the class of the vessels known as pseudo-apods, as some Argentinian archeologists call them. As their name indicates, they are closely related, from the morphological point of view, to the vessels known as apods or more simply aryballuses, which constitute in northwestern Argentina so many concrete proofs of Inca influence. Among the Chiriguano and Chané this type of pottery is exceptional, and the specimen of Fig. 70 b is a unique piece whose interest is considerably increased by the extraordinary resemblance it bears to a vessel discovered in the cemeteries of the Isla de Tilcara (Fig. 70 a). These two iru have so many similarities between them that one could easily believe them to have come from the hands of the same artist. In the regions near the habitat of the Chiriguano numerous vessels of this type have been dug up. Odilia Bregante (p. 287) /406/ enumerates for the specimens found in Jujuy province the following localities: Saruga, Taranta, Pucará de Tilcara, Isla de Tilcara, and Cochinoca, for the Puna de Atacama, Antofogasta de la Sierra. In La Paya in Salta province these aryballuses or aryballoid vessels are very numerous, and one of them published by Ambrosetti (6, Fig. 42, p. 62) has on the upper part of the belly a row of triangles with volutes, which we find again on our specimen from the upper Pilcomayo.

[415]
[172]
C
P.A.
415
171

Vessels of this kind are, as we have said, characteristic of the Inca civilization. Similar jugs already appear in Tacna during the Chincha or Chincha-Atacama period (Uhle, 4, Plate XVII, Fig. 4; Plate XIX, Fig. 1 and 1 a; Plate XX, Figs. 1 and 2). /Fig. 71 appears here./

C
415
171

This type is so little diffused in Chiriguano country that one could not invoke its occasional presence to attest to the strong Inca influence of civilization on these Indians.

C
[177]

6. The miniature vessel of Figure 71 is also a unique piece. If its distribution on the eastern slope of the Andes were not so sporadic, it would constitute an eloquent proof of the persistence of Inca tradition in Chiriguano pottery. Actually, as Linné (1, p. 161) demonstrated with the aid of

C
[177]

C
415
171

/406 cont./

a map, these footed vessels "bakershaped" /quoted in English/ mark out the whole extent of the Inca Empire from Ecuador to Chile and Argentina. This is the first time, however, that their presence has been noted among the Chiriguano and outside the borders proper of the Inca Empire.

C
[177]

7. As Nordenskiöld (10, Fig. 48, p. 162) established, the twinned Chiriguano vessels (Plate XXVII, 3)[1] also denote an Andean influence. As for that, it suffices to compare them with the ones from the Quebrada de Humahuaca (Debenedetti, 2, Fig. 144, p. 196).

C
415
531

Fig. 71. Miniature footed vessel. Prov.: Cuevo. (2/5 nat. size.)

C
415
171

8. As for the vessels consisting of triple connected bodies (Plate XXVII, 4), Jijon y Caamaño (p. 26) believes them to be of Central American origin. "Their center of dispersion," he says, "must be located in a southern region of Central America, from where, perhaps through the medium of the Arawak, they arrived in the Chaco and Peru." This hypothesis is tempting.

9. The Central American origin of the footed bowl or "compote" (Fig. 72)[2] could not be doubted. Jijon y Caamaño (pp. 31-51), Rivet (2, pp. 8-9), and Linné (2, Map 6, p. 107) have amply demonstrated it. On the subject of one of the varieties of this type, Jijon y Caamaño (p. 34) makes the

C
A
415
171

[1] [See P. 183 -- Analyst]
[2] [See P. 187 -- Analyst]

C A /406 cont./
415 following observation: "The dispersion and evolution of a type
171 of pottery whose /407/ origin must be assigned to the peoples near the Isthmus of Panama can be due only to the Arawak, who spread it among the nations living beyond the Andes, in regions as southerly as the Chaco and the territory of Misiones (1).

1. Ambrosetti (2, p. 714) as a matter of fact represents Kainguá vessels with a circular foot. I doubt very much that these pots reproduce a primitive type. They are badly fired, badly modeled, asymmetric, and the foot, which is fastened to the vessel when the latter is finished, is easily detached from it.

These vessels are perhaps crude imitations of European pottery.

A
171 In South America the Arawak have been the propagators of Central-American culture among the primitive tribes located
C east of the Andes."
A 10. The distribution of vessels with a ribbed belly, of
415 which I acquired a marvelous specimen in the Caipipendí
171 valley (Plate XXVI, 2),[2] is almost the same as that of the
C [126] "compotes," and we can, as with the latter, rank them with the pottery which shows a Central-American origin /Fig. 72 appears here/ and whose dispersion was the work of the Arawak (Jijon y Caamaño, p. 5, Fig. 1 D).

C 11. The vessel of Plate XXVII, 2[2] is composed of two
415 superimposed domes: one in the shape of a truncated cone,
171 the other rounded. It comes from Ivu and is the only specimen
C of this form that I encountered in the course of my trip. An
[172] identical vessel was dug up on the upper Paraná by Ambrosetti (3, plate between pp. 256-257, Fig. 5). Similar receptacles are still in use by the Yuruná /Yuruna/ Indians of the lower
C Xingú (Steinen, 1, plate between pp. 266-267). The presence
G of vessels of this type among the ancient Guarani authorizes us
415 to suppose that our specimen from Ivu represents /408/ the
171 survival of an ancient form of Guarani pottery which the
172 Chiriguano have not abandoned.

[2] [See p. 179--Analyst]
[2] [See p. 183--Analyst]

/408 cont./

000 Chiriguano have not abandoned. It is not out of the question,
CC however, that the Chané did not contribute toward preserving
415 this type,[1] if it was really they who made it known to the popu-
171 lations of tropical America east of the Andes. Jijon y Caamaño
C (pp. 11-13) studied its distribution in the two Americas and
[415] placed its center of diffusion in Central America. In Diaguite
[171]

C
415
171 In Diaguite country we find pottery of a more or less similar aspect, but
D which must nevertheless be eliminated from this category.
415 It is indeed provided either with a tongue-shaped appendage or
531 with an anthropomorphic or zoomorphic figuration (Ambrosetti, 6, pp. 372-380).

[1] [i.e. The type depicted in Plate XXVII, 2, p. 183 -- Analyst]

/408 cont./

415 171 172 12. The ornithomorphic vessel of Figure 73 seems to have come from the hands of the ancient potters of the Isla de Tilcara who, several centuries ago, used to make analogous pieces, without a doubt servilely imitated by the Chané and the ancestors of the Chiriguano (see Debenedetti, 2, Figs. 139-141, p. 191). Boman (2, Vol. II, p. 786, Fig. 193) also publishes a bird-shaped vessel, perhaps of the pavo del monte (Penelope obscura, Vieill.?), found not far from the present-day village of Humahuaca and which, in addition to its general appearance, has in common with our specimen

415 531

Fig. 73. Ornithomorphic vessel. Chiriguano. Motifs: pink and green. Prov.: Tarairí. (1/3 nat. size.)

415 171 172 from Tarairí designs painted on the sides which represent the wings and tail.

The Chiriguano Indians of the Caipipendí valley and the 415 532 Ivu mission still like to serve chicha in vessels to which they give the appearance of a bull (Plate XXVIII, 7-9).[7] Llama-[273] shaped vessels have been discovered in the Quebrada de [172] Humahuaca (Debenedetti, 4, p. 27, Fig. 14, and Odilia [171] Bregante, Fig. 132, p. 147). Perhaps these are the prototypes of the present-day Chiriguano specimens. Why suppose that [114] these receptacles had solely ritual usage, as Mr. Debenedetti thinks, when one sees the modern Chiriguano make an entirely secular use of them?

[7] [See p. 190--Analyst]

P.C. Ce 415 171 532

/408 cont./

13. The marvelous vessel of Plate XXVI, 2/1 is entirely of Andean inspiration. The idea of giving the shape of a human head to the neck of the yuro was not foreign to the ancient populations of the Quebrada de Humahuaca (Boman, 2, Vol. II, Fig. 190 and Plate LXXXII, Fig. f; and Debenedetti, 2, Fig. 136, p. 186). Up to the present time this region has not provided any vessel of this type which, by its beauty and the sureness of the modeling, /Plate XXVIII appears here/ /409/ was comparable to our specimen from the Itiyuro. The woman who fashioned it was a worthy artist.

C [415] →

Fig. 74. Vessel painted red. Prov.: Carurutí. (1/4 nat. size.)

P.E Ce 415 171 532

In Ecuador, vessels with a globular belly surmounted by a human head are frequent, but few specimens from this region can compete with this Chané masterpiece.

C 415 171 172

14. The vessels of Figures 74 and 75 and Plate XXVII, 1, 2/1 are characterized by a narrowing which separates them into two superimposed globular bodies of more or less similar diameter. In the valley of the Loa River a vessel of similar type was found which presents the most surprising identity with the one of Figure 74. Montell (1, Fig. 34 e, p. 28), who publishes it, makes the following remarks about it.

[Text Continues on P. 191]

[531] ←

Fig. 75. Vessel decorated with red and black motifs. Prov.: Caipipendí. (2/5 nat. size.)

1/1 [See p. 179-- Analyst]
2/1 [See p. 183--Analyst]

/409 cont./

415 "This particular form is not unique. It is found in the
171 northern cultures of the coast of Peru and its area of dispersion
172 stretches as far as Pachacamac and Ancon, including Lambayeque, Cajamarca, and Trujillo. East of the Andes, this type exists among the Chiriguano, the Ashluslay, and the Lengua. Specimens of it have been dug up by Debenedetti in Tilcara and in the Quebrada de Humahuaca. The find of the Loa River contributes to forming a link of this distribution uniting the /Fig. 75 appears here/ /see p. 189/ eastern zone with that of the Peruvian culture whence this type surely emanates.

Pots of this type show a striking resemblance to the signal trumpets of Guiana. Objects of this kind have been described by many authors and depicted by Gumilla and Roth. If one disregards the mouth and the base, one cannot distinguish these vessels from the terra-cotta trumpets. It is probable that this instrument was discovered independently in Guiana. In any case it is still too early to present theories on the possible connections between the two types, without preliminary research having been done to justify such comparisons."

To the distribution indicated by Montell must be added Molino del Puesto and Caspinchango in Catamarca province (Bruch, 2, Fig. 42, p. 54, and Debenedetti, 5, Fig. 14, p. 27).

415 15. Jugs with a globular belly or one in the shape of a
171 truncated cone, with a short and narrow cylindrical neck from which often begins a small handle attaching at the other end /410/ to the belly of the receptacle (Plate LVI, 1, 2, and 4; Plate LVIII, etc.), make up a very common type in all of the Chiriguano region which is in the hands of the missions. Up to the present the neighboring territories have not produced prehistoric vessels which could have served as models for the Chiriguano or the Chané at the time when Andean influence made itself felt on them. The only jug belonging to this type, outside Chiriguano country, is one found in Chile in Valdivia, which Medina (Fig. 184) reproduces in his great work on the antiquities

[See pp. 238 and 240 respectively-- Analyst]

C /410 cont./
415 of this country (1).
171

P.A. [415]

1. Vessels of this type also show great similarity to the Araucan ones which were discovered in the Argentinian territory of the Neuquén. (San Martin, pp. 10-15, pp. 131 and 132.)

C
415
531

Fig. 76. Cup decorated with black checkerwork on cream background. Prov.: Igüembé Valley. (1/3 nat. size.)

C
415
171

16. The little cup of Figure 76 is the only one of this shape I was able to collect. Like the vessels examined thus far, it constitutes by its aspect and decoration an Andean survival. Many cups have been discovered in northwestern Argentina. Some of these specimens have been found on the Isla de Tilcara (Debenedetti, 2, Fig. 149, p. 206) and at Casabindo in the Puna de Jujuy (Lehmann-Nitsche, Pl. IV, 5 D).

P.A. [172] [415]

17. Bowls have such a wide distribution in South America that their presence among the Chiriguano would not by itself be a sufficient argument to demonstrate the Andean origin of their culture. However, among these Indians, the numerous specimens of this category of receptacles found in each village show such similarities with the puco of the adjoining Andean regions that we are obliged to consider them as borrowed forms.

C [177]

C 415 171

/410 cont./

Thus, for example, the puco of Plate XIX, 2 and 4[1] are nearly identical with certain dishes coming from La Poma, Salta province. (Dillenius, Fig. 7, p. 13.)

The Chiriguano puco (Fig. XIX, 3) could easily be mixed with a specimen from La Paya (Ambrosetti, 6, Fig. 185, p. 368), which, like it, has two nipples on each side of the rim.

C [531]

The small bowl of Figure 77 carries on the rim two heads of a mammal stylized to the point that one can identify it as a llama or a puma, as one wishes. The two appendages in relief are perforated to allow a suspension cord to pass through. One would never finish enumerating all the receptacles of the Andean region which are decorated with the same motif. I shall limit myself to citing, in the countries adjoining the habitat of the Chiriguano, /Plate XXIX appears here/ /411/ several analogous finds. Thus, a dish of this type was dug up at Casabindo, on the Puna de Jujuy (Ambrosetti, 4, Fig. 49 b, p. 39, Vol. LIV) and at La Paya (Ambrosetti, 6, Fig. 181, p. 364).

P.A. [172] [415]

C 415 531

Several bowls (Plate XXIX, 1 and 6) of my collections are provided /Fig. 77 appears here/ with small nipples on the sides, whose use is, at first sight, enigmatic. As Rosen (2, p. 109, Figs. 167-188) has demonstrated, they are appendages which permit passing a small cord around the dish and hanging it. On some Chiriguano specimens these protuberances are perforated and a string passed through. By this means, /Fig. 78 appears here/ the bowl is suspended from the roof beams. Several from the Quebrada de Humahuaca (Debenedetti, 2, Figs. 60-63, pp. 111-112) also show these protuberances, whose use must have been the same as among the present-day Chiriguano. These nipples are doubtless handles or ears which, having lost all practical usefulness, were reduced /412/ to the state of simple ornamental motifs and not, as was believed, of still embryonic handles.

P.C. [415]

[1] [See p. 135-- Analyst]

C /412 cont./

415 18. To put an end to these comparisons, I shall call
171 attention to two vessels (Fig. 78 a and b), one acquired in
pp Ivu in the Chaco and the other in Tacna, and dating from the
415 Inca period (Uhle, 4, Plate XXVIII, 2). A simple glance at the two figures permits the establishment of their perfect identity.

C In short, from these comparisons and the ones we made
Ce on the subject of pottery in common use, we can draw the
415 following conclusions: Chiriguano and Chané pottery is, from
171 the morphological point of view, closely related to that of the ancient populations of southern Bolivia and northern Argentina
C and therefore offers numerous points of contact with the
Ce Chincha-Atacama civilizations. It still keeps traces of strong
[179] Inca influences (footed vessel (baker-shaped /in English/), aryballoid jars, ornithomorphic and anthropomorphic vessels, bowls, etc.). The ancient Arawak ethnic substratum is mani-
A fested in this sphere by the survival of several special types of
[415] pottery (vessels in the form of beakers or bowls (compoteras), vessels with a ribbed belly, vessels with three connecting bodies, etc.).

Ce The pottery in everyday use is clearly of Guarani inspira-
G tion and in its general features has remained identical to those
415 of the ancient Guarani of Bolivia.

C
531 Comparative Study of the Principal Decorative
184 Motifs of Chiriguano Pottery and That of the Neighboring Andean Peoples

The triangle with volute. In the region of the upper Pilcomayo the fundamental motif of pottery decoration is the triangle whose apex is prolonged in a volute or spiral (Plates XXXII-XXXIII,[1] 136-199). This decorative element is repeated to repletion on all the vessels I collected from the village of Saladito to the valley of Igüembé. Elsewhere it becomes less frequent and takes on a more rudimentary form, which can be considered as further developed or degenerated.

[1] [See pp 200-201 -- Analyst]

/412 cont./

531 184 Even on the upper Pilcomayo this design occurs in many variations according to the place or the artists: on certain pieces the volute which prolongs the triangle is clearly drawn (Plate XXXV, 1; XXXVII, 2; XXXVIII,[2] 2; etc.); on others it is no more than a hook more or less closed (Plate XXXII, 137-151). This last case is more usual. Finally, the hook itself is drawn with so little care that it is transformed into the simple arc of a circle, then into a straight line prolonging one of the sides of the triangle (Fig. 78 a).

Some vessels, generally outside the upper Pilcomayo region, /Plates XXX-XXXIV appear here/ /413/ present the same motif, but instead of the hook or the spiral the potter has painted a fret element (Plate XLI, 2, and XLIII, 1; LIV, 1 and 4),[2] more or less well executed. Thus one can follow the evolution of the spiral to the fret by going from one point to another of Chiriguano territory.

Most often these triangles with a volute are arranged in two rows and face each other alternately. When such an arrangement occurs, the potter always takes care to draw, along the line forming the volute, a parallel line of a different color, which, after following the inflections of the volute, goes to join that of the facing triangle. The figure (Plate XXXIII,[3] 178-194) thus obtained is a double volute in the form of a couchant S. It is particularly characteristic of the pottery of the upper Pilcomayo and the Igüembé valley. This double volute perhaps can be treated as an independent decorative element, witness the yambui of Plate XXXVI, 2, and LI, 3.

531 Sometimes, but rarely, the triangle with a double volute is replaced by an angle whose sides, by being drawn out, form a continuous line which unites these motifs to each other (Plate XXXVI, 1; XLVII, 3; LIII, 3).[4]

[191] The origin of this motif is lost in the night of time. It appears already very stylized on the vessels of the Tiahuanaco period, coming from Tiahuanaco itself (Posnansky, Plate III, Figs. E and F) and from the Mizque valley (Nordenskiöld, 5, p. 95, Fig. 40).

[1] [See pp 211, 213 and 214 respectively--Analyst]
[2] [See pp. 217, 219 and 233 respectively--Analyst]
[3] [See p 201--Analyst]
[4] [See pp 212, 226 and 232 respectively--Analyst]

A 531 172 C 531 171

/413 cont./

It is also met on most of the vessels from Tacna and Taltal, belonging to the period known as Chincha-Atacama (Uhle, 4, Plate XIX, Figs. 1 and 2; Plate XX, Figs. 1 and 2; Plate XXI, Fig. 2; Plate XXII, Fig. 4; Plate XXIII, Fig. 1; Plate XXIV, Fig. 2; and Guevara, Vol. I, plate between pp. 42 and 43 and between pp. 48 and 49).

These analogies with Chiriguano pottery become still more striking if one considers the details and arrangement of this motif. On a vessel from Tacna (Uhle, 4, Plate XX, 1) the volute takes off from two lines forming an angle, as on the yambuí of Plate XI, 1, published here. On the vessel from Tacna (Uhle, 4, Plate XXI, Fig. 2) the triangles with a volute face one another, and the inflections of the spiral are accompanied by a parallel line in another color. An anthropomorphic vessel found at Tacna (Uhle, 4, Plate XXII, Fig. 1) is also decorated with hooked triangles which face each other alternately.

As for the frets of Uhle's Chincha-Atacama vessel (4, Plate XXII, Fig. 4), they are doubtless volutes which the potter's fancy modified.

One can as well consider as a derivation of the voluted triangle the hooks which, on several Tacna and Taltal vessels and on a Calama calabash, form vertical and horizontal rows (Uhle, 4, Plate XX, Fig. 1; Plate XXI, Fig. 2; Plate XXIII, Fig. 3; XXIV, /414/ Fig. 3, etc.; Guevara, Vol. I, plate between pp. 46-47 and 48-49; and Oyarzun, Fig. 11). With the Chiriguano the voluted triangle underwent an analogous process of simplification, but this evolution took place only in very rare cases and on pieces whose decoration was drawn with a certain negligence (Plate XXXII, $\frac{1}{A}$138-140).

A 531 172

The textile fabrics from Arica discovered by Skottsberg (Figs. 41-42), which are kept today in the Göteborg Museum, exhibit the voluted triangle, among other motifs. Judging by their style, these specimens undoubtedly belong to Uhle's Chincha-Atacama period.

$\frac{1}{A}$ [See p. 200 -- Analyst]

PA 531 114

/415 cont./

On the other hand, the excavations carried out on the Isla de Tilcara have produced only a few specimens of pottery whose ornamentation was curvilinear. Debenedetti (2, p. 88) considers the latter, for reasons which I cannot accept, as foreign to the locality. Nevertheless, he has reproduced in his book the decoration of two dishes which is made up of facing triangles with volutes (Debenedetti, 2, Figs. 53 and 54, pp. 88-89) (Fig. 79); and he notes the same design on two other dishes which he does not reproduce. In the same publication (Debenedetti, 2, Fig. 113, p. 165; Fig. 114, p. 166; Fig. 115, p. 166) are represented three vessels similar to the Chiriguano yapepo and also decorated with hooked triangles.

C 415 531 191

/416/ The most interesting piece in this respect is the

C 415 191 531

PA 415 531

Fig. 79. a, bowl from the Isla de Tilcara, whose rim is decorated with facing voluted triangles; b, border of a dish decorated with voluted triangles (Isla Tilcara) (from Debenedetti).

C 415 191 531

yuro of Figure 70 b, reproduced from a drawing given by Debenedetti (2, Fig. 124, p. 173). We have already seen that its form is identical with that of a Chiriguano yu I bought on the upper Pilcomayo. The same is true for the general elements of its decoration.

PA 531

The voluted triangle is found on three other pieces from the Isla de Tilcara (Debenedetti, 2, Fig. 160, p. 217; Figs. 161 and 163, p. 217), which Debenedetti (2, p. 219) classes among the pottery imported to the Isla de Tilcara and utilized by curacas /chiefs/. Our yambuí from the upper Pilcomayo, which from the artistic point of view are very superior to the specimens described by Debenedetti, have often been bought

C 415 531 191 126

C /416 cont./
53] by me in humble cabins whose owners were certainly not
415 cuneca, but poor devils who had the luck to have a mother
19] or grandmother who was an expert potter. If the criterion of
[146] Mr. Debenedetti were admissible, the crude pottery and the
[114] fancy vessels which can be bought in every Chané or
C Chiriguano village would be products of two different civilizat-
415 ions. In reality the fancy pottery is used on feast days for drinking chicha; and the other, more humble in appearance, is adapted to daily needs.

PA
415
531

Fig. 81. Dish from Tilcara and decorated with red veluted triangles on a white background. (1/6 nat. size [illegible].)

PA
531
[114]

Besides, the veluted triangle is more frequent on the side of Tilcara than Debenedetti wishes us to think. In addition to the examples cited, seven others must be added (Debenedetti, [illegible], Fig. 54, p. 59; Fig. 38, p. 62; Fig. 40, p. 70; Fig. 46, p. 80; Fig. 165, p. 219; Fig. 165, pp. 219-220). A vessel from Allaricito in the same Quebrada bears a triangle with volute on the inside rim of the neck (Debenedetti, [illegible], Fig. 15, p. 29).

D 531 198

/419 cont./

hook (1). I strongly doubt that the triangle with volute and the

1. See, for example, Bruch (2, Fig. 32, p. 37; Fig. 66, p. 71; Fig. 70, p. 74; Fig. 85, p. 85; Fig. 90, p. 89; Fig. 130, p. 152) and Lafone Quevedo (2, Fig. 68, p. 384).

triangle with fret have a separate origin. The second doubtless derives from the first.

PA 531

At Tinti on the Salta plain the motif Odilia Bregante speaks of is a triangle one of whose sides is stepped and which terminates in a fret which in turn interlaces with the one taking off from the following triangle (see Boman, 3, Plate XIV, Fig. b). I cannot understand what arguments Odilia Bregante relies on in order to assert that no vestige of Diaguite culture exists in this place. The contrary seems to be true.

D [531] [114]

C PA 531 191

To sum up, the triangle with volute has a nearly uninterrupted distribution from the north coast of Peru to San Juan province in Argentina, and as far as central Chile. To the east it extends as far as the Pilcomayo and the Quebrada de Humahuaca.

The importance of this decoration increases in proportion as one moves from south to north. In Calchaqui country it is of secondary importance and constitutes an accessory motif; at La Paya it gains in preponderance and this asserts itself in the Quebrada de Humahuaca and on the Pacific Coast. In Chiriguano territory on the upper Pilcomayo it triumphs.

C 531

By itself this motif would constitute a meager proof of the existence of related cultures over the whole extent of this geographical area: but combined with other elements it acquires a very special significance.

C 531 191

The triangle with volute seems to have developed independently in the Guianas. At least I doubt very much that its occurence in that region is due to a western influence. The motif adorns manioc graters coming from the Patamona tribe (Nordenskiöld, 14, Fig. 19 c, p. 53) and several Wapiana /Wapishana/ and Taulipang calabashes (Koch-Grünberg, 3, Vol. III, Plate XIX, Figs. 1-3).

C /419 cont./

531 171

The S-shaped double volute (Plates XXXII-XXXIII,[1] 163-164, 167-197). I have already had occasion to insist on the fact that the S-shaped double volute was a motif closely associated with the voluted triangle. In certain cases, and, moreover, rare ones, this decorative element appears detached (see Plate XXVI, 2).[2]

P.P. [531]

The double volute has been painted on several vessels from Tacna (Uhle, 4, Plate XXIII, Fig. 1; Plate XXIV, Figs. 2 and 3; and Guevara, plate between pp. 46-47). There it is once even framed by a line which follows its contour exactly as on some Chiriguano vessels (Plate XXXII, 162-163).

PB 531

On vessels found at Calama and doubtless coming from Cagua (Yura, Porco province, Bolivia) and even in the region of Cagua /420/ (Créqui de Monfort, Plate VII, Fig. 8, and Plate VIII, Fig. 11) an S-shaped decoration is seen which could be brought nearer to our double volute if its style were different. The ends of the curve are slightly pointed, and a dot is inscribed in each hook.

PC. 531

Chilean potters have sometimes made use of the double volute to decorate their vessels, but a limited use (Latcham, Fig. 38, p. 16; Fig. 58, p. 25; Fig. 59, p. 26). This motif is also carved in a block /Fig. 81 appears here/ of stone from the Chilean province of Antofagasta, between Santa Fe del Toro and Quillagua (Plagemann, Plate III). In the Quebrada de Humahuaca the double volute embellishes the outside surface of the yuro from the Isla de Tilcara reproduced by Debenedetti (2, Fig. 124, p. 175).

PC [324]

PA 531

At La Paya the motif is represented on the bottom of two ornithomorphic puco (Ambrosetti, 6, Fig. 131, and Boman, 2, Vol. I, Plate XV, Fig. 29).

D 531 [415] [764]

A design in the shape of an S, but made up of a more or less wide band adorns the base or the belly of a large number of funerary urns of the Diaguite region and the bowls which closed them. This decoration /Plates XLVII-LIV appear here/ /see pp. 226-233/ /421/ is not to be confused with the one which has occupied us up to now because it is nothing but a

[1] [See pp. 200-201--Analyst]
[2] [See p. 179--Analyst]

C /421 cont./

531 171 The spiral as an independent decorative element has a much less wide distribution than when it is combined with the triangle it surmounts. In the geographical area which interests us it is known only on some pieces from the Quebrada de Humahuaca (Debenedetti, 2, Figs. 41 and 42, pp. 72-73; Bregante, Figs. 176 and 179, pp. 170-171), on a calabash from Calama (Oyarzun, Fig. 10), from the Puna de Jujuy and from the valley of Yocavil (Ambrosetti, 4, Fig. 70, p. 68, and Fig. 69, p. 72, Vol. LIV), on a puco from Pabellon in the Santa Maria valley, Catamarca province (Outes, 1, p. 19, Fig. 13).

C 531 Angles, triangles, and zigzag lines (Plate XXX, 1-46, Plate XXXI, Figs. 71-108, 127). Nearly all the yambuí and yapepo which form my collections are decorated on the interior rim, at the base of the neck, or on the upper part of the belly with interlaced angles, with series of triangles painted on the surface, which form denticulate bands. This decorative theme, simple and a bit monotonous, varies from one specimen to the other, according to whether the field of the triangles is sprinkled or surrounded with dots, whether the apexes are joined by angles or arcs of a circle, or, finally, whether or not these triangles are bordered by a broken line which they face.

C [184] Triangles and zigzag lines only rarely constitute the fundamental decoration of vessels. On the upper Pilcomayo, the yambuí of Plate LIII, 4, is the only one exclusively decorated with triangular dots and parallel zigzag lines. Some pieces from Ivu and Caipipendí are characterized by the same simplicity.

C 531 171 A 531 172 At Tacna and Taltal the series of triangular dots constituted a motif particularly dear to the populations of the Chincha-Atacama period (Uhle, 4, Plate XVII, Fig. 4; Plate XVIII, Figs. 1, 2, and 4; Plate XIX; Fig. 1 a; Plate XXII, Fig. 4; Plate XXIII, Figs. 3 and 4 and Figs. 21 and 22, pp. 40-41).

Prehistoric Chile SG3
Prehistoric Argentina SI3
Bolivian Prehistory SF4
Atacama SG5

C 531 171 /421 cont./

In Chile, on the pieces influenced by Chincha art, there is the same abundance (Latcham, Fig. 28, p. 14; Fig. 53, p. 21; Fig. 59, p. 26; Medina, Fig. 206).

PC 531

PA 531 171 /422/ In the whole northwest of Argentina, borders composed of triangles painted, striped, or reticulated are extremely frequent and do not form a type characterized clearly enough for anyone to try to give the distribution in detail. The latter extends from the Quebrada de Humahuaca to the Yocavil valley (Bregante, p. 182).

C P.A. B.P. 531 171 One of the varieties of this motif, however, is worth examining closely, for it permits establishing a striking parallel between present-day Chiriguano pottery and that of northwestern Argentina and southern Bolivia. It consists of a denticulate band or series of triangular dots and one or several zigzag lines which run parallel to these triangles. This decoration figures in my collections on the specimens of Plate XLI, 1, and Plate LX, 4. The archeological replica of this ornamentation is furnished by a vessel from Tolomosa (Tarija department, Bolivia), from Pabellon (Santa Maria, Catamarca), from Chañar Yaco (Catamarca) (see Rosen, 2, Fig. 166, p. 109; Outes, 2, p. 11, Fig. 8; Lafone Quevedo, 1, Fig. 5 e and f; Huaca E., p. 42). The excavations of the Messrs. Wagner at Llacta Maucta (Santiago del Estero province) yielded fragments of a dish whose patterns belong in this category.

A 531 172 The triangles which stand out against a background sprinkled with dots (Plate XLVIII, 1) and which form a band on the yambuí of Plate XXXV, 2, have their prehistoric equivalent at Taltal on a vessel of the Chincha-Atacama period (Uhle, 4, Fig. 21, p. 40).

PA 531 171 Series of triangles arranged horizontally are very often associated with the decoration of apodal or aryballoid vessels, which have been discovered in northwestern Argentina in such large numbers (see, for example, Boman, 2, Vol. I, p. 297) and, in general, over the whole extent of the Inca Empire.

/422 cont./

531
171

Festooned bands (Plates XXXI-XXXII,[1] 129-131). The series of triangles with which we have been occupied are often replaced by festooned bands (see, for example, Plate XLIX, 3; L, 1; and LIII, 3).[2] The transition from one of these motifs to the other is, so to speak, imperceptible; it is sufficient for the triangles to be slightly rounded for them to take on the appearance of a band of festoons. In northwestern Argentina the same transformation has taken place several times. A good example of it is the vessels from the Jachal (Bregante, pp. 179-181).

Isosceles triangles joined at the apex (Plate XXXI, 116-122). Two isosceles triangles joined at the apex form a design schematically representing an hourglass. This motif is rather common on Chiriguano pottery. In neighboring regions it is less frequent and seems to be peculiar to the pottery of Inca origin. Nordenskiöld (14, Fig. 69 a, p. 157) has already pointed out the close resemblance of this figure as it appears on several Chiriguano vessels with the one which decorates the ornithomorphic dishes /Plates LV-LVIII appear here/ /423/ of Cuzco. The analogy extends to the perpendicular lines which separate each one of the facing triangles from the following ones. This decoration is typically Inca. The ancestors of the Chiriguano copied this motif on several Inca specimens exactly like the ancient inhabitants of Tilcara, La Paya, and Catamarca who drew them: some, on a vessel with a lateral handle (Bregante, Fig. 320, p. 268), others, on a cup (Boman, 2, Vol. I, Plate XII, Fig. 26, and Plate XIV, Fig. f), and the last on an apodal vessel (Outes, 2, Plate III, Fig. 5). Outside of the "aryballuses," or purely Peruvian type vessels, the "hourglass" is a motif of rather rare use. It was painted on a vessel from Fuerte Quemado published by Ameghino (Vol. I, Plate X, Fig. 333) and on a vessel from Punta de Balasto (Lafone Quevedo, 2, Plate VII, Fig. a). Other examples could be cited, but I have neither the intention nor the means of being complete.

1/n [See pp. 199-200--Analyst]
2/n [See pp. 228, 229 and 232 respectively--Analyst]

C /423 cont./
531
191

This decorative element is no stranger to Chilean pottery either (Latcham, Fig. 42, p. 18, and Fig. 45, p. 19; Medina, Figs. 180, 202, 206, etc.). It figures also on the base of an Araucan vessel found in the territory of the Neuquen (San Martin, Plate 15, Fig. III).

Tooth-shaped triangular designs enclosing diamond shapes between them have been pyrographed on a calabash from Calama whose ornamentation matches that of our Chiriguano vessels.

Concentric diamond shapes (Plate XXX, 52-56). The series of concentric diamond shapes drawn on a goodly number of vessels in my collections had already been painted on the pottery of the Chincha-Atacama period at Tacna and Taltal (Uhle, 4, Plate XX, Fig. 2; Plate XXI, Fig. 2; and Guevara, plate between pp. 42-43) and pyrographed on the Calama calabashes (Oyarzun, Fig. 6).

P.A.
[531]

This design is classic, so to speak, on the aryballuses from Argentina (Boman, 2, Vol. I, Plate XVIII, Fig. 43, and Outes, 2, Plate III, Fig. 2).

PA
531

Reticulated design (Plate XXX, 59-64). Several vessels in my collection have a reticulated band on the belly or neck. On the vessel of Plate LIV, 2, the triangles have this detail. On the subject of this motif, Odilia Bregante (p. 162) expresses herself as follows: "Reticulated decoration is found in the middle of the Yocavil valley beside pieces which bear the symbol of the triangle with spiral and the stepped element and even in modern cemeteries like that of Chañar Yaco (see, for example, Lafone Quevedo, 1, Plate VII, Fig. a). But it is in the northern regions, in Salta and Jujuy, that the greatest number of specimens of this reticulation are found and where it enters into the composition of characteristic embellishments. On the Isla de Tilcara, in the Pucará de Tilcara, and in other localities, the archeological material which includes this design forms the most interesting type of pottery and is abundant enough to be classified."

PA. /423 cont./

531 Some vessels from the Isla de Tilcara and the Pucará de
C Tilcara, /424/ as a matter of fact, have a reticulated band on the
531 rim, like our Chiriguano vessels. (Debenedetti, 2, Fig. 45, p. 79,
171 and Bregante, Fig. 164, p. 166.)

PC In Chile we encounter bands, triangles, diamond shapes,
531 reticulated rectangles, and there again the unity of these different cultures in whatever has to do with pottery asserts itself. (Latcham, Figs. 25-28, p. 14, and Bregante, Figs. 232, p. 192.)

000 Figs. 25-28, p. 14, and Bregante, Fig. 232, p. 192.)

C Checkerwork (Fig. 76). A cup I acquired in the Igüembé val-
531 ley is decorated in a brown and white checkered design. This is the
171 only example I know in Chiriguano country. In northwestern
PA Argentina this motif has a very wide distribution: it extends from the
[531] Quebrada de Humahuaca to San Juan province (Bregante, p. 196).
[171] It was common in Chile (Latcham, Fig. 7, p. 7; Fig. 41, p. 18;
PC Fig. 55, p. 22, etc.). In the post-Columbian period it was still
[531] in use among the Araucan of southern Mendoza (Métraux, 6, Fig. 12, p. 50).

Atacama SG5
Prehistoric Argentina SI3
Chané SF8
Diaguita SG6

/424 cont./

C Ce 531 171 Crenels, broken lines, Z-shaped lines (Plate XXXII, 154-155 and XXXIII, 200-206). While trying to define in the preceding pages the decorative style characteristic of the Chané of the Itiyuro and the Chiriguano of the region of the Franciscan missions, I mentioned single or multiple lines which, running around the belly of the vessel, form triangles, crenels, and Z's with elongated or linked strokes. At first sight these apparently capricious motifs seem to escape all comparison and one would almost be tempted to believe them autochthonous or constituting reminiscences of Guianan art. Nevertheless, their counterpart is found in the archeology of northwestern Argentina and, as expected, in that of the Quebrada de Humahuaca. P.A. [531]

C Ce 531 171 P.A. 531 Ce PA [114] Debenedetti (2, Fig. 75, p. 132, and Fig. 78, p. 135) reproduces a goblet found on the Isla de Tilcara, which has on its lower part a band /Plates LIX and LX appear here/ /425/ composed of three parallel lines broken at right angles. Mr. Debenedetti rightly compares this decoration with that of Chané vessels, of which he shows an example he attributes erroneously to the Choroti. The same remark may be made about some engraved vessels from the Arroyo del Medio, which in some respects are similar to our Chiriguano vessels (Boman, 2, Vol. II, Fig. 207, III, p. 843).

C 171 531 D [531] PA [531] Much more striking yet is the resemblance between the Chiriguano yambui of this type and two vessels from the Diaguite region, one found at Molino del Puesto (Fuerte Quemado, Catamarca), and the other at Hualfin (Catamarca), both of which have been published by Bruch (2, p. 87, Fig. 88, and id., 2, Fig. 11, p. 8, and Fig. 27, p. 13). A puco from Llacta Mauca, province of Santiago del Estero, offers a similar design, to judge from a sketch by Mr. Duncan Wagner. There can be no doubt as to the Andean origin of this type of decoration.

A [531] [172] Z-shaped motifs stand out again on a vessel from Tacna of the Chincha-Atacama period (Uhle, 4, Plate XXI, Fig. 1) and from San Felipe, Chile (Medina, Fig. 68).

C /425 cont./
531
171

The large triangles which run around the belly of the îru and yambuí from the mission region strongly resemble an analogous motif which covers the outside surface of vessels made by the Neuquen Araucan (San Martin, Plate XV, Fig. 3).

Eyebrow-shaped design (Plate XLIX, 4).[1] A vessel from Saladito (upper Pilcomayo) has as its only decorative motif a strange decoration in the shape of a stylized eyebrow which stands out in white against a red background and is situated on the neck. This design is made up of two parallel lines separated by dots. In the presence of this curious motif one cannot help thinking immediately of the human faces painted on the funerary urns of the Diaguite region. The facial organs are overhung by a gigantic superciliary arch which, starting from the tip of the nose, descends to the height of the ears. The manner in which this part of the head is drawn recalls strongly the figure we are concerned with here.

D [415] [531] [764]

Cross. The vessel of Plate LX, 2, is decorated on the belly with a series of crosses inscribed in diamonds. This sign constitutes a decorative motif of which the present-day Chiriguano make exceptional use. Like the majority of the motifs painted on their vases, this one has no particular significance. A calabash from the same region is also decorated with pyrographed Maltese crosses (see Plate LXI, 1 /see p. 252 /). We know the frequency of this ornamentation, symbolic or not, on the funerary urns of the Diaguite country, principally of the Santa Maria region (Catamarca), a frequency such that it warranted a book by Quiroga, some of the illustrations of which are interesting.

D [415] [531] [764]

The cross appears also on a Taltal vessel of the Chincha-Atacama period (Guevara, plate between pp. 46-47 and 50-51), on a calabash from Calama /426/ (Oyarzun, Fig. 10), on another from the Puna de Jujuy (Ambrosetti, 4, Fig. 70, p. 68, Vol. LIV), *and on a box from Morhuasi (Boman, 2, Fig. 75, Plate XXVII)*, etc.

Representation of the human face. The human face is not reproduced on any of the vessels I collected. Nordenskiöld (10, Fig. 28, p. 137) shows and describes a pot on whose rim a face was represented: the nose was in relief and the other organs painted on it. The similarity of this motif and the one decorating some pieces from the Andean region does not need to be emphasized.

C [532]

[1] [See p. 228--Analyst]

/426 cont./

531 171 Sign of unknown significance. On the Macharetí yambui (Plate LII, 2) was painted a crescent-shaped sign having in its concave part two dashes perhaps representing feet. The subject is doubtless a stylized bird, a presumption all the more plausible because another vessel from the same locality and made by the same hand is decorated with animal figures (dogs and toads) (Plate LII, 1).

This mysterious sign is very similar to the one found on a puco from Tolomosa in the Tarija department (Rosen, 2, Fig. 175, p. 112) and on some dishes from La Paya. These designs are also more or less stylized pictures of a bird. (Boman, 2, Vol. I, Plate X, Fig. 22, and Ambrosetti, 6, Figs. 35-40, pp. 56-61.)

Zoomorphic representations. Animal figures are rare in Chiriguano pottery, but their occurrence only brings out the better the similarities of this art to that of the neighboring Andean regions. The rows of yaku (pavo del monte) on the yambuí from the Aguaray are the counterpart of the nandus on the Diaguite funerary urns and the La Paya birds. The dog on the vessel in the plate appears nearly identical with the bottom of a puco from Molino del Puesto, Catamarca. (Bruch, 2, Fig. 70, p. 72.)

531 171 105 The comparisons we have made could doubtless be extended and many another relationship noted between the modern pottery of the Chiriguano and that of the populations which have today disappeared from the Bolivian altiplano and northwestern Argentina. To continue such an investigation would be superfluous, for there is no one acquainted with the art which formerly flourished in the Andean and Chiriguano regions who would hesitate to establish a relationship between the two and would not have the second derive from the first.

As one might logically expect, these similarities become more numerous and more striking in proportion as one leaves the south and advances toward the north into the Andean zone which runs parallel to the habitat of the Chiriguano and Chané. When eastern [192] Bolivia is methodically explored, models of the vessels which the ancestors of the Chiriguano admired and copied will be found.

[See p. 231 -- Analyst]

C /426 cont./
531 Lacking them, the study we have pursued brings us the estab-
171 lishment of a very important fact. The existence on the upper
172 Pilcomayo of a pottery /427/ closely related to that of the
105

Ce

415

Fig. 83. Chané vessel. Prov.: Tuyuntí (Aguaray, Salta Chaco). On the belly: series of yakú (pavo del monte) in blackish brown on white background. (1/3 nat. size.)

C
531 Quebrada de Humahuaca is an indication which proves in a sure
171 way that the art of the former inhabitants of these regions was
172 identical to that of their neighbors, and perhaps racial brothers,
105 of the Bolivian altiplano.

Apropos of the Chiriguano, I believe it is wrong to speak of
S
121 Andean or Inca culture. The first of these terms is too vague and
531 the second partially false. In this chapter I have tried to demon-
171 strate that Chiriguano pottery exhibits close affinities with that
105 of the civilizations which, by their numerous points of similarity, seem to have undergone a Chincha or Atacama influence and which preceded Inca Culture.

/427 cont./

which preceded Inca culture. If one compares the present-day pottery of the Chiriguano with that of the Quicha /Quechua/ of Cuzco, certain analogies will appear, but they will be neither abundant nor conclusive enough to establish a direct filiation. Aryballuses are missing or rare, ornithomorphic dishes seldom found, etc.; on the contrary, we have seen how multiple and close the ties are between this pottery and that of the Chincha-Atacama period. Chiriguano pottery, in relation to that of Cuzco, is in a situation analogous to that of northwestern Argentina: on an Andean but original base, influences from Cuzco have been superposed. This Inca action on the Chicha is attested to even today by /428/ the presence among the Chiriguano of footed vessels of the purest Inca type and apodal ones of the same origin. Arising from the same influence, one may add certain decorative motifs, with which I have already dealt.

Arawak and Amazonian tradition is scarcely represented, except by footed bowls (compoteras), vessels with a ribbed belly, those with a body in the shape of a truncated cone and a subspherical belly, and perhaps by some motifs (T-shaped figures, Plate XXXVIII, 1).

The conclusion of this chapter will be: there exists today and for some years to come a civilization which, closely related to that of the Chicha, continues an art earlier than that of the Inca but influenced by them. May this fact make archeologists cautious!

Chapter VII

Calabashes

The second art in which the Chiriguano excel is pyrography and engraving on calabashes. When pottery-making was an essentially feminine activity, pyrography was the province of the men. Nordenskiöld (9, pp. 233-236) thinks, completely wrongly it seems to me, that pyrography is of Andean origin. He advances in support of this opinion the advantages that knowledge of metal offers to this art. Nevertheless, the populations of the

Guiana SR1
Guato SP15

C
Ga
GO
531
171

/428 cont./ Nevertheless, the populations of the upper Xingú where Andean influence certainly was never felt have pyrographed calabashes, as do the Guató /Guato/ of the upper Paraguay. Pyrography is equally in use among the Indians of Guiana, on whom any influence by Inca civilization is very problematical. The distribution of pyrography in itself demonstrates that there is no need at all of possessing metal objects in order to practice this technique.

C
531
171

If one compares the motifs which decorate the calabashes I collected in the Chaco with those exhibited by the pyrographed calabashes found in northwestern Argentina, one is struck by the similarity of their style and the numerous analogies of detail they have in common. Thus, the Maltese cross which decorates a calabash from Jujuy (Ambrosetti, 4, p. 68, Fig. 70, Vol. LIV) is found again identically on the calabashes of Plates LXI, 1; LXII, 1; and the volutes of a maté from Tastil (Boman, 2, Vol. 1, Fig. 84 a) have their counterpart in the hooks incised on the specimen of Plate LXI, 2. On the fragment of a calabash discovered in the same region (Boman, 2, Vol. I, Plate XXXII, Fig. 84) and on another specimen from La Paya (Ambrosetti, 6, Fig. 288, p. 524), we have the prototype of the checkerwork which so often embellishes /Plates LXI-LXXI appear here/ /429/ Chiriguano calabashes (Plate LXI, 1 a, and Plate LXIV, 2). The reticulated bands which frame the decoration of one of the Calama calabashes (Boman, 2, Vol. II, Plate LXXV, Fig. 176 b) are frequently incised on those of the Chiriguano (Plate LXVI, 1 and 4; Plate LXIX, 3, etc., for example), just like the rows of triangles on a blackened field which appear on some calabashes from the Puna de Jujuy (Ambrosetti, 4, Figs. 61-63, pp. 65-66; Figs. 70-71, pp. 58-69, Vol. LIV) and on the fragment from La Paya already mentioned. The zigzag line which stands out in white on the reticulated background of one of the Calama calabashes

[Text continues on p. 265]

C 531 171 /429 cont./
(Boman, 2, Vol. II, Plate LXXV, Fig. 186 c) reappears nearly identical on the pretty calabash of Plate LXII, 2.

C D 531 171 I can give no better argument in favor of the close analogy between the calabashes of the Andean region and those of the modern Chiriguano than by publishing the calabash of Plate LXII, 3 a and b, found in Diaguite territory in Catamarca province ("La Quebrada," Valle del Cajón). Its decoration is composed of incised and finely reticulated bands on a blackened background. The hooks which leave from the circle

Fig. 84. Incised and pyrographed calabash. Prov.: Caratindi (Igüembé Valley). (About 1/2 nat. size.)

engraved on the top of the calabash and the sides of the latter strangely recall analogous motifs we have seen on Chiriguano specimens.

C 531 171 The spiral, which seems to have been a motif especially dear to the pyrographers of northwestern Argentina and the Atacama Desert, does not occur on any of the specimens in my collections, if one does not want to consider as rudiments of spirals or as degenerated spirals the hooks we see on some Chiriguano calabashes (Plate LXI, 2). It is interesting to ascertain that the spiral and the voluted triangle of Andean calabashes are typologically closely related to analogous motifs which the Chiriguano women of the upper Pilcomayo paint on their vessels. If these designs have been better preserved in pottery than in pyrography, it is doubtless due to the fact that the first art has remained closer to its origins. The women, who have the monopoly of it, are more conservative than the men, who decorate the calabashes.

C [323] [462]

/429 cont./

531 On almost all the calabashes in my collection, pyrographed
171 designs alternate with incised motifs. Perhaps it is the same with the calabashes of the Andean region. Judging from the ex-
[114] cellent photographs which Boman (2, Vol. II, Plate LXXVI) gives us of them, and from /430/ the specimen from the Calchaqui valley which I am publishing here, this scholar erroneously considers them as having been entirely pyrographed. When a Chiriguano incises a design with a knife on a calabash, he is always careful to fill the engraved lines with ashes to make them stand out. At first sight this process may be confused with true pyrography.

415
531

a b

Fig. 85. a and b. Engraved calabash. Only the rim has been lightly pyrographed. On one side (a) is seen a feline animal (jaguar or puma), on the other (b) a fox (?) and a bird. Prov.: Masaví (Igüembé Valley). (About 1/2 nat. size.)

531 A single glance at Plates LXI-LXXI allows one to realize that pyrography and engraving on calabashes do not obey such rigid stylistic rules as pottery. These calabashes differ very much, and there are scarcely any motifs that seem to be preferred to others. To what is this diversity due? I believe it artificial; and I am convinced that formerly this art followed precise norms, in a word, that in times past there was a true style of pyrography and engraving on wood. How would one explain otherwise that precisely the most beautiful pieces in my collection are at the same time the oldest and the most similar to the Andean prototypes (Plate LXI, 1 and 2; LXII, 1 and 2; LXIV, 2; LXVIII, 2 and 3, etc.)? Let us not forget that

A34 cont./

286 The Chiriguano have their loom in common with many tribes
[197] of tropical America, and they doubtless were already acquainted with it in Paraguay, at least in a more rudimentary form. In some Chiriguano villages looms of the Inca or Quichua /Quechua/ type, that is to say, horizontal ones, can be seen. The warp is then fastened to a small cord along a piece of wood and the cloth is rolled around as it is produced.

286 Headbands and belts are woven with looms of a type similar
[294] to the one just described. The warp threads are fastened to a loop of cotton attached to a hut post. As the fabric is made it is rolled around two small sticks or two ears of corn attached to the lower end of the warp (for this type of loom, see Nordenskiöld, 10, Fig. 4, p. 175).

29 I am reproducing in Fig. 95 a tsimbi headband. These orna-
30 ments have now become very rare, and only a few old men still wear them. Our specimen is dyed with natural colors.

29 Every Indian woman who lives outside the influence of the
[198] missions still wears the tipoy, that is a kind of long sheath which they fasten on the shoulder nowadays with a safety pin and formerly
[286] /Plate LXXII appears here/ /436/ with a thorn. In olden times these tipoy were woven by the Indian women on looms of the Arawak type. They were of cotton and dyed blue-black. /Fig.
[439] 90 appears here./ Today it is almost impossible to find a woman whose tipoy is not made of chamalote, a kind of cheap cotton cloth which the Syrians and half-breeds sell at a high price to our Indians. In the Caipipendí valley /Fig. 91 appears here/ I met two old women who still kept the tipoy of olden times. They would not
[126] give it up to me for any price. At Caruruti, an old fellow desirous of striking a good bargain sold me his wife's at a very /436/ high price in order to buy brandy for himself. It was very necessary to celebrate Easter fittingly.

[198] The shirts (tiro-bumbae) which the men formerly sported exist no more except in the memory of the old men.

000 animals or human beings. There is nothing like that among the
C Chiriguano. The simplicity /437/ of their fabrics forms a striking
286 contrast with the richness and variety of the decoration of their
53 pottery. Their inferiority in this respect is far from corresponding
171 to the skillfulness which is their wont in all their activities. It is
C enough to see the admirable pieces of work executed by little
286 Chiriguano girls in the missions to realize what they would have
174 been capable of if historic traditions had not held them away
857 from this art. Their distant Tupi-Guarani ancestors were
T-G acquainted with only rudimentary forms of weaving, and it can
286 be asserted that /Fig. 95 appears here/ this industry remained
174 foreign to all the Tupi tribes which did not undergo the influence
T of a nation more civilized than they. The Tupinamba of the
286 Brazilian coast apparently practiced only the double-thread
174 technique (Doppelfadentechnick) by means of which they used
G to make their hammocks. The ancient chroniclers note the use
286 of the tipoy among the ancient Guarani of Paraguay, which is an
[175] indication of the existence of weaving among that subdivision
[291] of the Tupi family. Their present-day descendants, the Kaingua
/Caingua/, could pass for good weavers to judge by the fineness
G of the several fabrics which have been collected among them.
[291] These are for the most part wide belts which they pass between
their legs and knot around their loins. In reality, weaving is in
its beginnings among them, /438/ as is shown by their loom. It
is only a simple frame around which the warp threads are coiled.
The woof is passed through, thread after thread, as in darning.

Ee No doubt it was the Chané who taught the Chiriguano to weave,
286 and as they had probably not reached a /Fig. 96 appears here/
177 very high level in this art, they could only transmit to their
successors and suzerains, the Chiriguan, a still little-developed
technique, which the latter have scarcely improved on.

/438 cont./

323 The contrast between a highly evolved pottery and a still
287 rudimentary art of weaving is characteristic of the Indians
286 of the tropical and subtropical regions of South America, at
1971 least for those who can pass for being relatively civilized,
such as the Arawak and the Karib /Carib/.

Chapter IX

Basketry and Its Techniques

1. General Considerations

Basketry is far from being as abundantly represented among the Chiriguano and the Chané as among the Indian tribes of the Amazon basin or the Guianas. The secondary role it plays in their industry is due to the nature of the soil where they live and the climate they enjoy. Palm trees with pinnate leaves are lacking, to my knowledge at least, over the whole extent of their territory: as for the ones whose leaves open like fans, if they are numerous in certain places, their occurrence is far from being uniform. The palms which the Chiriguano Indians call karandaí (Copernicia australis) form veritable groves here and there, whereas over vast regions they are lacking or appear only sparsely. I saw a considerable number of them between San Luis and the Saladito River, and I have crossed some large palm groves between Tacuiba and Villamontes, on the Pilcomayo, and south of the Parapití River, going from Cuevo to Pipi. I noted, moreover, that the distribution of the karandaí coincided with that of a certain type of basketry (twilled work /named in English/), for which the Indians use these leaves.

Fig. 97. Back basket used by the Guaraýó Indians for transporting heavy loads (from Nordenskiöld).

Nordenskiöld (11, p. 169) recounts an anecdote which illustrates well the influence the environment exerts on this industry. At the time of one of his trips into the Chaco, the scholar was accompanied by several Guaraýó Indians, who followed him as far as Chiriguano country. The Guaraýó customarily load their baggage and the products of their fields into back baskets of a special type (see Fig. 97) which have a wide distribution in tropical America, from the Guianas to Paraguay (Nordenskiöld 11, p. 171 and MAP 21).

/439 cont./

p. 171 and Map 21). Their baskets being in bad shape, the Guarayú wanted to make some new ones and were very annoyed not to find in the region into which they had come the palm trees with pinnate leaves which they were in the habit of using for this purpose. Now, Guarayú and Chiriguano are brothers in race and language and emigrated at the same period from Paraguay to settle in the vicinity of the Andes. When leaving their country of origin, both were acquainted with this type of basket used by their ancestors, the Guarani, the Tupinamba of the Brazilian coast, /441/ and still favored among their first cousins from Paraguay, the Kaingué (Métraux, 2, p. 208). The disappearance of this cultural element among the Chiriguano is due solely to the lack of appropriate raw materials.

In order to make up for the absence of back baskets, indispensable to a farming people /Fig. 98 appears here/ the Chiriguano borrowed from their neighbors in the Chaco, either the Mataco or the Chorotí, the carrying nets (in Chiriguanit allapoka) whose use is so widespread among the latter and is so characteristic of their civilization. Carrying nets today are in general use among the Chiriguano, and in every village each family has at /Fig. 99 appears here/ least one (Fig. 98 and 99). In spite of this wide diffusion, the Chiriguano allapoka betrays its origin by its form and technique (see Fig. 100 and 101 /see pp. 282 -285/), which are both found in the tribes we have just enumerated (Nordenskiöld, 8, p. 208, Technique I). Although considerably more advanced on the way to civilization than the semisnomadic tribes of the Chaco, the Chiriguano do not by any means equal them /441/ in the art of making nets. The allapoka I collected cannot be compared with the deep bags which the Mataco or the Chorotí, for example, make for the same purpose. In the village of Machareti, where Tobá live with Chiriguano, it is the former who furnish the latter with the /Fig. 100 appears here/ carrying nets they need (see Fig. 99 /see p. 282/) (1).

1. Nordenskiöld (15, p. 162, Fig. 49 A) gives the detail of the technique of a Chiriguano carrying net. This technique is not found on any

[Text cont. here on p. 285]

/441 cont./

286
482

Fig. 100. Technique of the net of Fig. 98 (Technique I, according to Nordenskiöld, 9, p. 208).

286 /In. 1 cont./ of the allapoke I brought back
482 from the Chaco. I suppose it is a question of
● 171 a carrying net which the Chiriguano might have bought from Choroti, who, with the Ashluslay and the Matako, seem to be the only ones to use this technique. The technique we show in Fig. 101 is known to the Ashluslay, the Choroti, and the Tapiete. Nordenskiöld (9, p. 208) does not mention it among the Toba, where it nevertheless exists, as the allapoka of Fig. 99 testifies.

C /442 cont./ The basketwork of the
285 ancient Guarani or Tupinamba did not differ essentially in tech-
171 nique, form, or processes of ornamentation from the basketwork
174 of the north of southern America (Métraux, 2, pp. 249-255). It must have offered more than one point of similarity with that of the Chané, and we must consider the modern basketwork of the Chiriguano the heir of the basketwork common to these two /443/ nations. Let us notice in passing that the basketwork of the populations of tropical America has a certain unity. Nevertheless,

C
286

Fig. 101. Technique of the net of Fig. 99 (Technique V, according to Nordenskiöld, 9, p. 208).

C it was in the Guianas that it reached perfection.
285 After their great migration to the foot of the Andes, the
171 Chiriguano seem to have adopted basketwork of a new technique,
174 which doubtless was unknown to their ancestors and racial brothers in Paraguay and Brazil. This technique is characteristic of all the baskets I am putting under the heading of wicker work /named in English/ in the following pages. As we shall see,
Ce [285] this technique also exists in the Guianas, and it is possible that
[171] it was brought into the Bolivian Chaco by the Arawak nation
[174] of the Chané. The center of dispersion of the Arawak must be
ooo

Ce 101 174 /443 cont./ the center of dispersion of the Arawak must be placed to the north of the Amazon, and before the Chiriguano invasion the Arawak tribe of the Chané was established over the whole extent of the territory now occupied by the former.

C 285 171 Beside this technique another exists, known to the Chiriguano since time immemorial and well before their great migration. The English-language ethnographers give it the name of twilled work. No other type of basketwork is so widespread. This technique is preponderant in all of tropical America from the Antilles to Paraguay and in the south stops at the Chaco. The Chiriguano are the only Indians of the Chaco among whom twilled work is in current use. This type of basketry used to exist on the coast of ancient Peru, but its importance there was not great and it appears only in work baskets.

C 285 184 Basketry in wicker work and that in twined work do not have an identical distribution among the Chiriguano. Baskets of the first kind are numerous in the villages of the upper Pilcomayo (Saladito, Salado Grande and Chico, Ibopeytí, and Yumbia) and go as far as the Ivu mission. They stop, or are rare, in the rest of the Chiriguano country, notably in the Caipipendí valley, where baskets of the second type (twilled work) predominate almost exclusively. These are widespread there, and the beauty of their workmanship, the embellishments with which they are provided, put them well above the basketwork of any other zone and even above that of tribes living in regions richer in palm trees.

C [126] In the huts of the upper Pilcomayo I collected several baskets in twilled work, but they were rare there and often incomplete and torn. I had the impression that they had arrived there by way of commercial exchanges. In any case, the Indians no longer plait baskets of this type, and it is possible that their disappearance has given value to the specimens of them which remain. That would explain the absence of any new specimen and the preservation of ancient baskets almost beyond usefulness. Be that as it may, at present the true center of basketry in twilled work is the Caipipendí valley, and that of the basketry of /444/ wicker work, the region of the upper Pilcomayo. Since the living conditions of the

C [178] Chiriguano in the missions north and south of the Pilcomayo have undergone deep modifications, I do not know what the respective

/444 cont./

285 184 distribution of these two techniques must have been in former times. We shall find this difficulty every time we consider the diffusion of a cultural element peculiar to these Indians.

285 177 Wicker work basketry has undergone strong European influence. The agents have been the half-breeds of the department of Tarija, who live in constant contact with the Chiriguano. This foreign influence on the baskets belonging to this technique is manifested by modifications of the original forms and improvements of details, such as horseshoe handles.

285 171 Among the Chiriguano I did not find a single basket woven with the technique called "in spirals" (coiled basketry /named in English/), although in olden times it was in use among the Andean populations who used to and still do live in contact with the Chiriguano. Basketwork "in spirals" has continued on the altiplano, as the basket of Fig. 103, which I bought in La Quiaca, proves.

Basketry in "Wicker Work"

285 Mason (p. 228) designates under the name of wicker basketry a type obtained with the following technique: a rigid framework composed of thick, solid elements is intercrossed by thinner, more flexible elements. In the course of this work I shall call warp the rigid elements of the framework, and the ones crossing them, woof. The woof passes alternately over and under each element of the warp. This technique is well known to us: it is that of our wicker baskets, trunks, and back baskets (see Fig. 105 /see p.295 /).

Because of its very simplicity we have a right to suppose that this technique is old. It is only a variety of checker work /named in English/, the most elementary of all the techniques. By checker work we understand the process which consists of interlacing flexible bands so as to obtain a checkerboard design. The only piece of basketry made with this technique that I know of in the region we are concerned with is a basket that Eric von Rosen

/444 cont./

285 (1, Fig. 134, p. 122) obtained from some Choroti who were
[114] camping near Tatarenda. I share the opinion of this explorer, who considers this object as of Chiriguano origin.

In spite of its simple and archaic character, basketry in wicker work is rare in South America. According to Nordenskiöld
[171] (10, p. 171, and 11, p. 198), it is found among the Araucan, Yurakare, Atsawaka, Tambopata Guarayú (Chama), Yamiaka, and the Indians of Guiana, in particular those of the Roroima region.

/446 cont./

285 This information needs to be completed. The technique
171 called wicker work was apparently known to the ancient Diaguite. A vessel from one of the Andean valleys in Tucuman province bears imprinted on its base impressions left by a tray or basket in wicker work, upon which the potter had placed this receptacle when the clay was still soft (Fig. 102). This discovery did not surprise me: already, and for a long time, I had supposed that this manner of plaiting baskets was not foreign to the peoples of the Andes. How otherwise could one explain the occurrence of wicker work among the half-breeds and Indians of Tarija department, the Araucan and Chiriguano Indians of the upper Pilcomayo?

Guiana forms a second area of dispersion of this technique without, however, its being very common there. The small bags in which the Patamona put the cotton with which they provide the arrows of their /447/ blowguns before blowing them are in wicker work, the same as the pegalls with the so-called "armadillo" motifs of the Arawak, Patamona, and Makuŝi /Macusi/. The baskets in the form of carafes or bottles of the Siusí /Siusi/ and Kauá /Caua/ of the Aiary River are also good examples of this technique. (On the modalities and distribution of this technique, see Roth, p. 140 and Plates 104, 105, and 106, and pp. 329-331.)

The distribution of this technique is wider in North America. It is known to the Indians of eastern Canada and abounds in /Fig. 102 appears here/ southern Mexico and in Central America. It appears scattered here and there on the Pacific Coast and in the interior basin.

Most of the fish weirs, the enclosures for stopping game during hunting drives, and the coarse baskets serving for the transport of numerous objects are made in this technique.

285 If one examines the baskets of this type among the Chiriguano,
323 one will doubtless be struck by the fact that several of them assume the form of pottery pieces. This resemblance is further accentuated by the fact that some (see Plate LXXV, 2 /see p. 299/) are provided with lateral handles in imitation of vessels. The interplay between these two industries is evident.

/448/

285 The horseshoe handles which surmount some of these baskets
● 191 (Plate LXXV, 1 and 3)[z] seem to me to come from imitation of
192 European or half-breed basketwork. Among the half-breeds of the eastern slopes of the Andes I found baskets which had exact replicas among the Chiriguano (see, for example, Fig. 108 /see p. 302 /) and attested eloquently to the borrowing of the latter.

285
191

Fig. 102. Base of a vessel from the mountainous region of Tucumán Province, and bearing the impressions of a tray or basket in wicker work, on which it rested during its manufacture.

Besides, the Chiriguano give the Spanish name of canastos to baskets of European form /Fig. 103 appears here./

Among the baskets in wicker work there are some (Plate LXXV, 4) which in form and technique are singularly reminiscent of the baskets of Brazilian Guiana which Koch-Grünberg (?, Vol. II, p. 221, Fig. 242 a, b, c) compares to carafes. (Cf. also Roth, Plate 104, Fig. C.)

z [See p. 299--Analyst]

/452 cont./

285 This small basket is closely related to the preceding one in its technique. The warp is made of four fibrous bands which cross in octagons and are then divided into three /Plate LXXVII appears here/ /453/ or two diverging elements which form the warp (see Fig. 106 /see p. 301/).

Figure 108. Height, 12 centimeters; maximum diameter, 28 centimeters. Provenance: Ivu.

[199] There is no doubt that this basket is a pure and simple imitation of European ones. I have seen baskets identical from the point of view of form and technique among the half-breeds of the department of Tarija.

3. Basketry in "Twilled Work"

The term twilled work designates the basketry technique in which the woof elements pass over two or several elements of the warp so as to produce with the contexture of the fabric diagonal motifs and an infinity of others all based on the changes of rhythm in the number of the warp elements which have been skipped over (Mason, p. 224).

285 In the pages where I dealt with wicker work I have already had
• 191 occasion to note the affinities which not only the technique but coin the form of Chiriguano baskets offer with those from Guiana. The analogy is still more striking with twilled baskets. We have among the Chiriguano the exact counterpart of the famous telescope baskets or pegall of Guiana. These are rectangular baskets in two parts, one fitting into the other and shutting hermetically (Plates LXXVII, LXXX,[a] and Figs. 110 and 111). Nordenskiöld (10, p. 173) has given us a map indicating the distribution of baskets provided with a cover into which they fit more or less completely. These "telescope" baskets are particularly abundant north of the Amazon. I suspect that the famous harameno of the Tupinamba, in which the latter put their feathers, must have belonged to this type. Among the Tupi-Guarani, the only ones where this type of closure has been noted are the Guayaki, Paumona, Mashé /Maw/, and Oyampi (Métraux, 2, p. 253).

[a] [See pp. 309 & 309 respectively -- Amalfi 57]

/453 cont./

285 [531] [171] Another point of contact between the basketry of the Chiriguano and that of the Indians of the east and north of South America is the occurrence of baskets in twilled work in which elements of two colors are combined, following a changing rhythm, to produce geometric figures. The basket of Plate LXXVIII, with the frets standing out in black on the sides, is representative of this form of art, which, in the Guianas, shone with a lively brilliance.

Baskets of the pegall or "telescope" type are divided into two categories according to the principle of their plaiting. To make one kind (Plate LXXIX, and Fig. 111), the basket-maker began by crossing the warp elements with one another in such a way that they radiate from a single center. Then he interlaced according to a binary rhythm the tigellas which /454/ left the common center like so many rays. Baskets of the second category have been plaited by intermingling the elements of the warp and woof at right angles so as to make the bottom without any precise point from which the elements come away (Plate LXXX, 2). The photographs (Plates LXXIX and LXXX, 2) show what I mean better than any description.

[824] The stalks which serve for the fabrication of baskets in twilled work are taken from the leaves of the carandaí palm (Copernicia cerifera Mart. or Copernicia australis). The leaves are cut into fine strips and softened by immersion.

Sieves and fire fans belong in the basketry called twilled, but I shall deal with them in a separate chapter.

Description of baskets in "twilled work"

Plate LXXVIII, Figures 1 and 2. Height, 7 centimeters; diameter, 17.5 centimeters. Provenance: Caripendí.

This basket belongs to the category of those called "telescopes" or /Fig. 110 appears here/ pegall of Guiana. Plate LXXIX which shows us the detail of its upper surface also indicates its technique with sufficient clarity so that no diagram is necessary. The warp is composed of 32 flexible elements radiating from a common center. They begin by interlacing for two rounds: then,

[See P. 308 - Analysis]

/457 cont./

G 415 285 Sieves are of two kinds. The first category includes those whose meshes are close together and composed of fine strips of karandaí leaves intercrossing in a binary rhythm. Sieves of this type belong in the basketwork called twilled. The Chiriguano give them the name of urumpé and use them in preference to the others, whose usage is limited.

The second category includes sieves with wide meshes. The strips forming them cross in checkerwork, that is, the woof passes alternately under, then over, an element of the warp. The Chiriguano designate sieves of this type by the name of urumpesa, and they use them for sifting ground corn when they wish to obtain a coarse flour.

G 415 285 191 Some of these sieves are real works of art, but they cannot be compared with the magnificent specimens from Guiana, on which the alternation of the black and white elements produce geometric figures of the handsomest effect. It is probable that formerly the Chiriguano had identical sieves, as can be supposed from the one on Plate LXXXII, which is composed of a warp and a woof whose gray and white elements are arranged in such a way as to form dark and light bands on which concentric squares stand out.

C 415 191 The sieve is widespread in all of tropical America, where it is used not only for corn flour but also for that which the natives make from bitter manioc. It is unknown to the primitive populations of the Chaco, who have not even felt the need to borrow it from the Chiriguano or Chané. The populations of the Inca Empire /458/ did not know its use. The urumpé is a utensil common to nearly all the Tupi-Guarani tribes; it has been described or noted among the Tupinamba, the Guarani, the Kainguá /Caingua/, the Guarayú, the Fauserna, the Apiaká /Apiaca/, and the Parintintin. The Chiriguano must therefore have taken along with them when they emigrated from Paraguay, which does not exclude the fact that they may also have found it in use among the Chané.

C [174]

/460 cont./

Fans or Fire-blowers

C 372 184 [171] Great was my surprise when upon arriving in the Chiriguano villages of the upper Pilcomayo region I found fire fans identical with those of the Indians of Brazil and the Guianas. Nordenskiöld (10, p. 56) barely mentions them and insists on their rarity. The fact is explained by the absence of this cultural element in all the rest of the zone inhabited by the Chiriguano. In most of the villages they use old hats or fragments of baskets to fan the fire.

C 372 285 Plate LXXXV. 2/1 Length, 28.5 centimeters; width, 31 centimeters. Provenance: Saladito.

The making of these fans is rather simple. The leaves composing them cross in a rhythm of two. On the edge the stalks have been bent back and, passing again across the fabric, are interlaced to form a pucker on each side. The free ends /Plates LXXXIII-LXXXV appear here/ /461/ have been plaited on top and one part passed into a split stick forming the handle (Fig. 117).

C [171] An important remark must be made on the subject of these fans. They /Fig. 117 appears here/ differ little from the fans made of a single pinnate palm leaf, such as are found in Brazil and Paraguay. The Chiriguano, having no palm trees of this C [824] species in their new homeland, had to /Fig. 118 appears here/ adopt the palmate leaves of the karandaí. They replaced the petiole, which forms the handle, with the split stick to which I have alluded. (Max Schmidt, 2, Figs. 106 and 107, pp. 219-220.)

C 285 353 797 [824] /462/

"Flowers"

On feast days the Chiriguano of the Franciscan missions decorate the church with artificial "flowers" which they make from leaves of karandaí palms. These decorations are of ancient origin and derive directly from the straw amusements /jeux/ still made by the Indians in various /Fig. 119 appears here/ regions of America, notably in the Guianas. The natives of the latter region often hang them in their houses where they perhaps

serve as amulets, and, in any case, as ornaments. (Roth, pp. 497-499. Figs. 241-244 and p. 270; Koch-Grünberg, 2, Vol. II, p. 244.) In the same way the Chiriguano Indians decorate their huts with these figures, which they take care to have blessed. Exactly as in Europe they keep palm branches as lucky charms. Rosen (1, p. 61, Fig. 51) publishes a similar straw amusement which he found among the Choroti and which was pointed out to him as an ornament worn on the forehead. This explorer suspects the exactitude of this information and supposes that a ritual object is concerned. In reality, it is only a "flower," which the Choroti described by Rosen probably received or bought in some Chiriguano mission. It is enough to compare the figure of it that he gives us and ours in order to be convinced of this.

Figures made of palm leaves are not, however, unknown to the other Indians of the Chaco. The Ashluslay sold me a diadem braided according to this principle (Fig. 119) and Rosen (1 Fig. 44, p. 48) reproduces an identical head-ornament which he bought from a Choroti tribe.

/464 cont./

796 Eyu ickuama — Come and kiss me
832 Simireko mi — My little wife
786 Diyuru emesie — Give me thy mouth

Ime deresa ikavi — Thou hast pretty eyes
Ime diyuro misiray — Thou hast a little mouth
Tuiia dipota — I love thee much
Pairamo ayporu deve. — For that I am going to ask for thee.

796 During this time young or old men with their faces
532 covered by a mask (aflawasu) run here and there, force the peo-
522 ple to dance by blows of a stick, play tricks on them, and address jokes to them.

796 The feast lasts as long as there is kiwi or alcohol. At
[293] the moment when it is on the point of ending, a final ceremony takes place. The rite of going out is similar to the rite of entering: the couple who planted the flowery stick tear it from the ground and go out of the village, followed by the aflawasu and all those who took part in the festival. The procession advances to a certain distance from the village to the sound of the flutes and drums. They throw away the masks and throw stones while shouting. The carnival is finished and everyone goes home.
[585] Some take along their new wife, for it is at this moment that most marriages are celebrated.

796 The carnival festivity such as I have just described in-
177 volves only a few elements borrowed from the half-breeds or
178 creoles, outside of the coincidence of dates. This is an ancient
[241] feast of a purely agricultural character, which the Chiriguano have acquired the habit of celebrating at the same time as the Bolivian carnival. Besides, the Indians of Ibopeyti are pagans.

796 The masked men are supposed to represent the spirits of the
241 dead, as their name indicates (aflat spirit; wasu great). As in
171 the festivals of the Guianas and Central America, they come in numbers //Plate LXXXVI appears here/ /465/ to insure for their

[Text continues on p 329]

C /465 cont./
796 descendants or relatives the fertility of the fields and the
241 abundance of the future harvest. These masked festivals have
[171] their counterpart in the famous ceremonies of the populations of
C the Negro River, the details of which Koch-Grünberg has made
[177] known to us. Besides, it is probable that the Chiriguano borrowed these ceremonies, and especially the masks, from the
A Chané. It is the racial brothers of the Chané, the Arawak of
796 the Negro River, who celebrate these festivals with the most
241 splendor. The Chané of the Paraguay still accord to these ancient
C rites more importance than the Chiriguano, and their masks
796 crowned with immense tufts of feathers are, it appears, more
241 sumptuous than those of their old Guarani enemies.
532

In the missions the carnival has lost its purely pagan significance and has become contaminated with magic which
C the Chiriguano have borrowed from the half-breeds. Nino
796 (pp. 267-270) gives a good description of them, of which I
[177] [177] shall summarize the principal features.

The festival is directed by a personage wearing an old-
C man mask. He stops at each corner of the square, recommending
[532] peace and harmony to all.

Then they give themselves over to different games masked personages scatter bean pods or corn bean upon the dancers.

Young men, masked but almost entirely naked, daub themselves with mud and try to soil all those who have new
C [177] garments. These two customs can have only a Bolivian origin.

Individuals who are also masked mime a combat between
C a jaguar and a bull which is finally put to death by a fanciful
796 hunter. Then they pass on to the pleasures of the dance. "The
532 dancers form a large circle by joining hands and dance thus
[536] three times. Three times also they squat down, and three more times they pass under the extended arms of a couple of the same circle, and finally the same number of times they press against one another, forming a big mass, their faces turned toward the outside and their hands folded. They remain in this position until another couple dances around them. These do not hold each other by the hand. The man chases the woman and tries to grab her. She avoids him and goes to hide in the middle of the others."

/488 cont./

forming a design. Combs of this category generally have a double row of teeth, but sometimes one row is entirely covered by the planing and is transformed into a handle (Nordenskiöld, ?, Fig. 168, p. 304). These two kinds of comb are also found in the Andean zone; but whereas the first is limited to this geographical area and especially to northwestern Argentina, the second, which includes all varieties of composite combs, has a vast distribution
